23982 (UCRL-JC–111437) **Absence of superconductivity in $(Pr_{1.5}Ce_{0.5})Sr_2Cu_2NbO_{10}$: A general correlation with magnetic ordering.** Radousky, H.B. (Lawrence Livermore National Lab., CA (United States)); Goodwin, T.J.; Shelton, R.N. Lawrence Livermore National Lab., CA (United States). Dec 1992. 6p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-48. Grant DMR-90-21029. (CONF-930107–2: 2. Israeli international conference on high T_c superconductivity, Elat (Israel), 4-7 Jan 1993). Order Number DE93012579. Source: OSTI; NTIS; GPO Dep.

$(Pr_{1.5}Ce_{0.5})Sr_2Cu_2NbO_{10}$ is found to be an insulating analog to $(Nd_{1.5}Ce_{0.5})Sr_2Cu_2NbO_{10}$, $(Sm_{1.5}Ce_{0.5})Sr_2Cu_2NbO_{10}$ and $(Eu_{1.5}Ce_{0.5})Sr_2Cu_2NbO_{10}$ which have superconducting transition temperatures near 28 K. $(Pr_{1.5}Ce_{0.5})Sr_2Cu_2NbO_{10}$ is also observed to display two magnetic ordering transitions, near 15 K and 50 K, which are not observed for the Nd, Sm or Eu based materials. This compound is a new example of the absence of superconductivity in a $PrBa_2Cu_3O_7$ related structure which exhibits an unusually high magnetic ordering temperature relative to the other members of the rare earth series. An argument is made for a general correlation between the absence of superconductivity and the presence of magnetic ordering in these structures. The observation of this correlation in the $(R_{1.5}Ce_{0.5})Sr_2Cu_2NbO_{10}$ system is compared to similar observations in $RBa_2Cu_3O_7$ and $RBa_2Cu_2NbO_8$. The physical basis for the general nature of this correlation is discussed in terms of f electron hybridization and the unusual crystal field splitting observed for the Pr ion in the YBCO structure.

23983 (UCRL-JC–111458) **Absorption and damage thresholds of low defect density hafnia deposited with activated oxygen.** Chow, R.; Falabella, S.; Loomis, G.E.; Rainer, F.; Stolz, C.J.; Kozlowski, M.R. Lawrence Livermore National Lab., CA (United States). Oct 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9210356–1: Laser-induced damage in optical materials, Boulder, CO (United States), 28-30 Oct 1992). Order Number DE93013853. Source: OSTI; NTIS; GPO Dep.

Motivation for this work included observations of a correlation between increasing laser damage thresholds and both decreasing nodular-defect density and absorption of coatings. We reduced the nodular-defect densities by a factor of over 4x in hafnia coatings deposited by reactive e-beam evaporation from a Hf target source. In order to increase the metal oxidation kinetics at the coated surface, Hf was e-beam deposited reactively with oxygen activated by a μ-wave discharge. The effect of using activated oxygen during the evaporation of a hafnia target source was also evaluated. A series of hafnia layers were made with various conditions; we alternated between two μ-wave configurations, hafnium and hafnia targets and two reactive oxygen pressures. Laser damage thresholds (1064 nm -10 ns pulses), absorption (at 511 nm) and nodular-defect densities from these coatings are reported. The damage threshold correlated inversely with the coating absorption.

23984 (UM-P–92/102) **Preparation and characterisation of the compound $Tl_{0.65}$ $Bi_{0.35}Ca_{0.8}$ $Sr_{1.7}$ Cu_2 O_y using oxalate co-precipitation and analytical CBED and an initial preparation of Bi_2 Ca_{n-1} Sr_2 Cu_n O_{4+2n} for n=5.** Goodman, P. (Melbourne Univ., Parkville, VIC (Australia). School of Physics); Nexhip, C.; O'Donnell, T.; Miller, P. Melbourne Univ., Parkville, VIC (Australia). School of Physics. [1992]. [10p.] Sponsored by Australian Research Council, Canberra, ACT (Australia). Grant no. A68930390. Order Number DE93625470. Source: OSTI; NTIS (US Sales Only); INIS.

A new superconducting compound of approximate formula $Tl_{0.65}Bi_{0.35}$ $Ca_{0.8}Sr_{1.7}Cu_2O_y$ has been prepared using oxalate co-precipitation of the Tl-free component followed by reaction with Tl_2O_3. This compound has orthorhombic symmetry (probable space group P2mm) and a Tc of 87K. A byproduct of this synthesis has been the synthesis of a new superconducting compound in the Bi-Ca-Sr-Cu-O series with a c-spacing of 55 Angstroms, and space group A2aa, which requires further evaluation. 4 refs., 4 figs.

23985 (ANL/MCT/CP–78715) **Measurement of residual strain in composites by means of time-of- flight neutron diffraction.** Kupperman, D.S. (Argonne National Lab., IL (United States). Materials and Components Technology Div.); Majumdar, S.; Richardson, J.; Saigal, A. Argonne National Lab., IL (United States). Materials and Components Technology Div. [1993]. 16p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9305188–1: 1993 annual meeting of the American Crystallographic Association (ACA), Albuquerque, NM (United States), 24-28 May 1993). Order Number DE93012939. Source: OSTI; NTIS; INIS; GPO Dep.

Neutron diffraction time-of-flight measurements using the Intense Pulsed Neutron Source at Argonne National Laboratory have been employed to study strain in various metal- and ceramic-matrix composites. For example, measurements carried out to 900 C on a composite composed of a titanium alloy matrix and silicon carbide fibers have been used to validate theoretical assumptions in the prediction of fabrication-induced residual stress. Sapphire reinforced nickel aluminide composites have also been studied. Studies of a high-temperature ceramic superconducting composite consisting of yttrium barium copper oxide and silver with various volume fractions of silver have also been carried out. The results of these studies have provided information on the effect of Ag content on interface bonding. In addition, ceramic-matrix composites with randomly dispersed ceramic whiskers with varying fiber content have been investigated.

23986 (ANL/MCT/CP–79029) **Development of nondestructive evaluation methods and prediction of effects of flaws on the fracture behavior of structural ceramics.** Ellingson, W.A.; Singh, J.P.; Holloway, D.L.; Dieckman, S.L.; Singh, D.; Sivers, E.A. Argonne National Lab., IL (United States). Materials and Components Technology Div. Mar 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9305135–3: 7. annual conference on fossil energy materials, Oak Ridge, TN (United States), 11-13 May 1993). Order Number DE93012942. Source: OSTI; NTIS; GPO Dep.

Work emphasized continuous-fiber ceramic matrix composites (CFCCs) with 2-D lay-ups composed of chemical-vapor-infiltrated (CVI) SiC/SiC materials, mostly made of Nicalon plain weave with 16 x 16 tows/in. One sample examined comprised a 3-D SiC/SiC braid made by Techniweave. Using a new 1024×1024×14 bit detector, images from 3-D X-ray CT data with pixel sizes of <140 μm and 2-D fast-Fourier transform (FFT) image processing, we have shown that fiber orientations can be measured to ±2-1/2°. 3-D FFT analysis was used to determine 3-D braid/weave fiber spacing. Multinuclear (^{1}H, ^{13}C, and ^{29}Si) NMR spectroscopy, is being studied. Surface chemistry of fibers and chemistry of interfacial regions in composites are being studied. We are also conducting initial studies to investigate the bulk composition of matrix materials (α, β, amorphous phase, silica, and oxynitride concentration) and surface chemistry of Si_3N_4 and SiC fibers. Fracture mechanics

work to correlate with NDE data focused on strength distribution of as-fabricated Nicalon fibers obtained from bundle tests. Strength distribution of fractured Nicalon fibers in composites was assessed from fracture mirror radii. SEM was used to determine distribution of fiber pullout length distribution for fibers in composites, for their strength distribution. From the strength distribution plots, scale parameters were determined to be 3.45 GPa for as-fabricated fibers and 1.31 GPa for fibers in processed composites. However, the Weibull moduli for the two distributions were similar. Reduction in strength of the fibers in processed composites is believed to be due to surface flaws and defects. Effects of fiber misorientation on mechanical properties of NDE-tested CVI continuous-fiber composites are currently being investigated. 8 figs, 11 refs.

23987 (BNL–70317) **[Travel to France for a plant inspection to establish the ability of Quartz et Silice to assess crystal growing capacity]: Foreign trip report, March 10–15, 1993.** Kettell, S.; Li, K.K. Brookhaven National Lab., Upton, NY (United States). 26 Mar 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93011429. Source: OSTI; NTIS (US Sales Only); GPO Dep.

An inspection of the plants was made with attention to facilities and capability of growing the pure CsI crystals required by the order. This included availability of manpower, raw materials, oven readiness, growth yield, process of cutting, polishing, wrapping, and measuring. An updated delivery schedule was agreed on which calls for completion of the first endcap (of E787 detector at Brookhaven AGS?) in June, and the second one in Oct. 1993.

23988 (BNL–70318) **[Travel to France for a plant inspection to establish the ability of Quartz et Silice to assess crystal growing capacity]: Foreign trip report, March 10–16, 1993.** Kettell, S. Brookhaven National Lab., Upton, NY (United States). 26 Mar 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93011428. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A physical inspection of the CsI crystal growing capacity was made. The cutting and polishing facilities were inspected. The current inventory of crystals for our order was inspected. The facilities for measurement of the optical properties of the crystals was examined. We established that the shipment of the first completed ring of crystals and the presentation of a final schedule will be provided by Q+S by mid-April. The CsI crystals are for the two end caps of the E787 detector at the Brookhaven AGS.

23989 (CEA-CONF–11235) **Vacancies and negative ions in GaAs.** Corbel, C. Institut National des Sciences et Techniques Nucleaires (INSTN), Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). 1991. [6p.] (CONF-9108150–: 9. international conference on positron annihilation, Szombathely (Hungary), 26-31 Aug 1991). Order Number DE93625594. Source: OSTI; NTIS (US Sales Only); INIS.

We use positron lifetime studies performed in GaAs materials to show the defect properties which can be investigated by implanting positive positrons in semiconductors. The studies concern native and electron irradiation induced defects. These studies show that vacancy charge state and vacancy ionization levels can be determined from positron annihilation. They show also that positrons are trapped by negative ions and give information on their concentration.

23990 (CEA-CONF–11236) **Thermal and physicochemical properties important for the long term behavior of nuclear waste glasses.** Vernaz, E. (CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement); Matzke, H.J. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement. 1992. [37p.] (CONF-920887–: 8. international symposium on thermodynamics of nuclear materials, Snowbird, UT (United States), 16-21 Aug 1992). Order Number DE93625592. Source: OSTI; NTIS (US Sales Only); INIS.

High level nuclear waste from reprocessing of spent nuclear fuel has to be solidified in a stable matrix for safe long-time storage. Vitrification in borosilicate glasses is the technique accepted worldwide. A number of different glasses was developed in different national programs. The criteria and the reasons for selecting the final compositions are briefly described. Emphasis is placed on the French product R7T7 and on thermal and physicochemical properties though glasses developed in other national projects (e.g. the German product GP 98/12 etc.) are also treated. The basic physical and mechanical properties and the chemical durability of the glass in contact with water or other aqueous solutions are described. The basic mechanisms of aqueous corrosion are discussed and the evolving modelling of the leaching process is dealt with, as well as effects of container material, backfill, etc. The thermal behavior has also been studied and extensive data exist on diffusion of glass constituents (Na) and of interesting elements of the waste such as the alkalis Rb and Cs or the actinides U and Pu, as well as on crystallization processes in the glass during storage at elevated temperatures. Emphasis is placed on the radiation stability of the glasses, based on extensive studies using short-lived actinides (e.g. Cm-244) or ion-implantation to produce the damage expected during long storage at an accelerated rate. The radiation stability is shown to be very good, if realistic damage conditions are used. The knowledge accumulated in the past years is used to evaluate and predict the long-term evolution of the glass under storage conditions.

23991 (CONF-9207203–, pp. 186-189) **Production technical development for mesocarbon microbeads.** Akinaga, H. (Osaka Gas Co. Ltd., Osak (Japan)); Yoshioka, M.; Tamamura, H.; Kitamoto, M. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Optically anisotropic globules of 1μ m to 80μ m obtained by heating coal tar pitch at a temperature of about 400°C (mesocarbon microbeads: MCMB) have superior properties as a raw material for carbon materials, but render a large difficulty in industrial and continuous production techniques. This paper summarizes the CHERRY-T process as an established industrial process, and introduces characteristics and applications of the product MCMB. The process feeds coal tar into a reactor to heat it at a temperature of about 400°C under pressure to produce MCMB, separates the MCMB continuously using a high-temperature centrifugal separator, and refines the resultant solvent using tar medium oil and light oil. Reaction severity controls the MCMB grain size, and the solvent refining process controls volatiles. The MCMB is useful as a special carbon material for high-density carbon materials, a functional composite material for resins and rubbers, or a surface modifying material for column filling and adsorbing materials. 4 figs., 2 tabs.

23992 (CONF-9209221–, pp. 43-67) **Positron studies applied to microelectronics technology.** Rubloff, G.W. (IBM T.J. Watson Research Center, Yorktown Heights, NY (US)). Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

Positron studies have already proven valuable in a variety of areas relevant to microelectronics, most notably the characterization of defects, interfaces, and materials in thin film and multilayer structures. Such studies have been directed largely toward the resolution of research issues in materials and processing science as well as solid state physics and chemistry. The purpose of this talk is to address potential applications of positron studies in microelectronics technology over a broader range, extending from research to technology development and manufacturing. Two key areas of opportunity for new characterization methods are: (1) enhanced ability to predict the performance of materials and devices, i.e., reliability science; and (2) more rapid learning about processes and their consequences for thin film structures during all phases of the technology development path. Reliability science is an extremely challenging aspect of microelectronics technology. Although achieving high manufacturing yield (% of chips which work) is important, it is at least as important that the product be reliable, i.e.

continue to function for years without failure. Extensive empirical work is normally done to assure reliability, primarily by acceleration testing experiments which operate the chips at elevated temperature, humidity, stress, or current/voltage to simulate longer-term behavior under less demanding, more representative conditions. Early detection of susceptibility to reliability failure modes would represent profound advantage, as well as a contribution toward the evolution of reliability science.

23993 (CONF-9209221–, pp. 131-148) **Defect characterization of overlayers and interfaces using variable energy positrons.** Lynn, K.G. (Brookhaven National Lab., Upton, NY (US)). Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

The use of positron annihilation spectroscopy (PAS) to study overlayers, interfaces, and buried regions of semiconductors and metals, has seen rapid growth in the past few years. There are few other techniques that are sensitive to low concentrations of open-volume-type defects and are capable of nondestructive defect depth profiling. The characteristics of the annihilation gamma rays and the lifetime of the positron depend strongly on the local environment of the annihilation sites and can be used to quantitatively determine defect concentrations in a range inaccessible to conventional defect probes, yet important for the electrical performances of device structures. This talk will show how PAS can be used as a nondestructive probe to examine defects in technologically important systems. In silicon, the use of PAS to characterize the quality of overlayers as a function of different growth conditions, formation and annealing of defects after ion implantation, identification of defect complexes, and electric field distributions from charged defect centers, will be examined. The hydrogen activation energy for Si-SiO_2 interface trap centers, interface density variations, positron mobility in SiO_2, hole-trapping at Si-SiO_2 interface, radiation damage in Si-SiO_2 systems, and stress induced by thermal oxidation studies are summarized. The author also provides a brief summary of the use of PAS in other systems and some future directions. The need to complement these types of laboratory studies with the use of intense positron beams is addressed. In particular, the ability to perform 2D-ACAR on a small spot at various regions around the interface make it a very unique tool to determine not only the electronic structure of an interface but to identify the exact nature of the defects at the interface between two systems.

23994 (CONF-9209221–, pp. 123-130) **2D-ACAR and monoenergetic positron beams.** West, R.N. Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

During the past 25 years the field of low energy positron physics has seen three major developments: (i) positron-defect studies; (ii) 2D-ACAR; and (iii) slow positron beams. These three developments have essentially changed the field from an esoteric activity practiced by a few university groups to one which is now embraced by major national and industrial laboratories. The recognition of positron trapping in open volume defects some 23 years ago broadened the scope of positron studies from essentially pure physics to a wide range of materials science. There is little doubt that the resulting stimulus and increased funding then provided was instrumental in the creation of 2D-ACAR and slow positron beams. The contribution of positrons to real world problems (i.e. recovery mechanisms in metals and alloys, degradation in reactor cladding materials etc.) was indeed repaid in the mid-seventies when technological advances made 2D-ACAR, at long last, a tenable proposition. The advance that represented, over the earlier practiced 1-D technique it now clear to us all.

23995 (CONF-9209221–, pp. 317-326) **Measurement of glass transitions and other properties of polymers by positron spectroscopy.** Jones, P.L. (Duke Univ., Durham, NC (US)). Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

Increasingly, high tech polymers and composites are being substituted as structural materials for many engineering components traditionally fabricated from metallic alloys. Polymeric materials offer distinct advantages in many applications due to their high strength to weight ratios, as well as their superior insulating and damping properties. However, due to their molecular structure, polymeric materials exhibit thermo-mechanical behavior and environmental degradation mechanisms that are much different than those found in metallic alloys. As such, intelligent use of these materials in engineering applications requires a thorough understanding of their time dependent behavior. One method of evaluation that has proven very useful is positron annihilation lifetime spectroscopy (PALS). The positron lifetime spectra of amorphous and semicrystalline polymers typically can be deconvoluted into three and sometime four components. By formulating interpretations based on established free volume theory, PALS data can be used to predict changes in macroscopic behavior. Additionally, due to the molecular level sensitivity of this technique, PALS can be used to evaluate changes in physical properties before macroscopic property changes become evident. Degree of crystallinity, glass transition and sub-glass transition phenomena, hysteresis effects due to thermal cycling, physical aging and structural relaxation have all been characterized using PALS. Developing the methodology to quantitatively evaluate cavity size distributions and percent free volume from these parameters would provide the information needed to refine current understanding of the effects of thermo-mechanical treatment on molecular structure, and hence physical properties of engineering polymers.

23996 (CONF-9209221–, pp. 377-381) **[Polymer applications].** Sandreczki, T. (McDonnell-Douglas Corp., St. Louis, MO (US)). Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

The author discusses several applications of positrons to the study of polymers. Free-volume effects are of particular interest to applied measurements. The questions include what is the functional free volume, exactly what does positron annihilation measure, what are the distribution functions of hole sizes as a function of temperature, pressure, and crosslinking, and what about physical aging problems. In an industrial setting, the author wants to see answers to these questions, not studies on the general problems. Particular engineering questions with regard to polymers which are of interest include: impact strength, and its aging; time changes in physical and chemical properties; presence of voids; delaminations; interfaces between fibers and the matrix; distribution of the plasticizer. The author wants specific answers to these questions, and in particular answers which can be given routinely with good response time. Other questions regarding conducting polymers are also listed.

23997 (CONF-921276–, pp. 215-218) **Preparation of large monolithic silica aerogel and measurement of its properties.** Tajiri, K. (Government Industrial Research Institute, Nagoya, Nagoya (Japan)); Igarashi, K.; Nishio, T.; Asahina, T. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Silica aerogel is a porous material expected to be developed for use as transparent heat insulators. Large cylindrical test specimens with a diameter of about 8 cm were fabricated on a trial basis for

discussion. TMOS was used as the raw material to fabricate test specimens with different densities. A conventional supercritical drying high-pressure vessel with a volume of 200 cm^3 as increased in size by adding 1000 cm^3 for the present experiment. Wet gels were dried in the drying vessel which was pressurized with nitrogen gas under predetermined temperature and pressure patterns. While the temperature distribution gradient has been found larger than the conventional cases, abrupt pressure variation at operating the valves was suppressed. Monolithic gels were obtained with a diameter of 8 cm and a thickness of up to 1.5 cm. The materials were removed from the vessel and heated in air to improve hydrophilicity, light permeation, and hardness. A suitable heat treatment temperature was found to be 500°C. For the light permeation, transparency as high as from 90% to 94% was obtained for the gel with a thickness of 1 cm. No aging effect of wet gel was observed on the light permeation. The monolithic gel was found different from the TEOS-based gel in the light permeation, which decreased with decreasing density. 11 figs.

23998 (CONF-921276–, pp. 219-222) **Preparation of electrochromic nickel oxide film by electrochemical deposition.** Miki, T. (Government Industrial Research Institute, Nagoya, Nagoya (Japan)); Yoshimura, K.; Tanemura, S. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

An electrochromic nickel oxide film was formed on a glass substrate covered with indium tin oxide (ITO) using an electrolytic deposition process that uses nickel nitrate aqueous solution to evaluate the material properties. When a voltage of about ± 0.6V is applied across the ITO as the base and a platinum electrode using 1M KOH aqueous solution as an electrolyte, a typical electrochromism was exhibited, in which the light permeation changes reversibly. Current flowing in the film decreased and the voltamogram grew smaller as the number of cycles in the cyclic voltanmetry increased. No color extinguishing occurred after 20 cycles, and the film remained colored, and developed cracks and separation. The separation should have occurred resulting from weak adhesion of the film to the ITO which caused structural (volumetric) change in the film itself. Sintering the film improved the durability. When the sintering temperature exceeds 250°C, crystallization of the nickel oxide film develops more rapidly, the structural change progresses more slowly in the electrolyte solution, and the electrochromism emerging characteristic drops. 11 refs., 5 figs.

23999 (CONF-921276–, pp. 223-226) **Theoretical design of selective emissivity film. 2.: Improvement of radiative cooling power of silicon oxide film on Al substrate.** Tazawa, M. (Government Industrial Research Institute, Nagoya, Nagoya (Japan)); Tanemura, S. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

With an objective to improve radiative cooling power of materials with selective emissivity using silicon oxide, a radiative cooling simulation was carried out on films with multiple components and layers. A material that utilizes the so-called atmospheric window with wavelengths from 8 μm to 13μm, and gives off thermal energy on the ground surface efficiently outside the atmosphere in the form of infrared radiation is called a selectively emissive material. The radiative cooling power may be improved by making radiative spectral of the material close to the ideal form by multiplying the components, and by reducing infrared absorption from the atmosphere in regions outside the atmospheric window by multiplying the layers. An SiO and Si compound film had the radiative cooling power increased by about 20% and the maximum ultimate temperature difference by 1°C to 2°C over a single SiO film. A dual layer film having an upper layer comprising the SiO and Si compound film and a lower layer comprising an SiO film showed the same trend, with an especially favorable result when the SiO ratio in the compound film is 0.4. A selectively emissive material using silicon oxide may be improved more effectively by multiplying the components than by multiplying the layers. 3 refs., 8 figs.

24000 (CONF-930561–4) **Thermographic properties of eight blue-emitting phosphors.** Cunningham, D.M. (Swarthmore Coll., PA (United States)); Allison, S.W.; Smith, D.B. Oak Ridge National Lab., TN (United States); Swarthmore Coll., PA (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 39. international instrumentation symposium; Albuquerque, NM (United States); 2-6 May 1993. Order Number DE93010830. Source: OSTI; NTIS; GPO Dep.

We examined the effect of temperature on the light absorption and emission properties of eight phosphorescent compounds. These phosphors are commercially produced powders that emit mainly in the blue region when illuminated with ultraviolet light in the range 220 to 400 mn. Excitation and emission spectra measured over the range 20 to 350°C are examined for these phosphors. Data from the emission spectra indicate that there is a significant temperature dependence in this temperature range. In all eight phosphors, the maximum relative intensity decreased as the temperature increased. In some samples, the emission bandwidth and position also changed with temperature. Of these phosphors, $BaMg_2Al_{16}O_{27}$:Eu and $Ba_3(PO_4)_2$:Eu are candidates for studies at higher temperatures.

24001 (CONF-930822–4) **In-situ crystallization of silicate glass films deposited on α- Al_2O_3.** Mallamaci, M.P. (Minnesota Univ., Minneapolis, MN (United States). Dept. of Chemical Engineering and Materials Science); Carter, C.B.; Bentley, J. Oak Ridge National Lab., TN (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ;FG02-92ER45465 ;AC05-76OR00033. From Annual meeting of the Electron Microscopy Society of America; Cincinnati, OH (United States); 1-6 Aug 1993. Order Number DE93012969. Source: OSTI; NTIS; GPO Dep.

Ca aluminosilicate glass films were grown on single-crystal α-Al_2O_3 at <950 C by pulsed-laser deposition. The films were then heated in an electron microscope to determine the effect of α-Al_2O_3 crystallography on crystallization of Ca-aluminosilicate glasses. 4 figs, 5 refs. (DLC)

24002 (DOE/CE/23810–6) **Miscibility of lubricants with refrigerants, Phase 1: Final report, 6 February 1992–15 October 1992.** Pate, M.B. (Iowa State Univ. of Science and Technology, Ames, IA (United States). Dept. of Agricultural Engineering); Zoz, S.C.; Berkenbosch, L.J. Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States); Iowa State Univ. of Science and Technology, Ames, IA (United States). Dept. of Agricultural Engineering. Oct 1992. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE93014766. Source: OSTI; NTIS; GPO Dep.

Miscibility data have been obtained for a variety of non-CFC refrigerants and their potential lubricants. Ten different refrigerants and seven different lubricants were investigated. Experiments are being performed in two phases: Phase I, reported herein, focuses on performing screening tests for miscibility and Phase II consists of developing miscibility plots. The miscibility tests are being performed in a test facility consisting of a series of miniature test cells submerged in a constant temperature bath. The bath temperature can be precisely controlled over a temperature range of -50 C to 90C(-58 F to 194 F). The test cells are constructed to allow for complete visibility of lubricant-refrigerant mixtures under all test conditions.

24003 (DOE/CE/23810–8C) **Compatibility of refrigerants and lubricants with motor materials: Quarterly technical progress report, 1 October 1992–31 December 1992.** Doerr, R. (Trane Co., La Crosse, WI (United States)); Kujak, S.; Waite, T. Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States); Trane Co., La Crosse, WI (United States). Jan 1993. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE93014768. Source: OSTI; NTIS; GPO Dep.

Equipment manufacturers are challenged to replace CFC-based refrigerants and their lubricants with environmentally acceptable alternatives. Information on the compatibility of motor materials with these alternative refrigerants and lubricants is a basic requirement for reliable performance. This report presents compatibility data for 24 commercially used motor materials exposed to 17 refrigerant/lubricant combinations. This compatibility data will enable the phase out of CFC's to continue at its current fast pace and insure the continued reliable performance of refrigerant-based equipment.

24004 (DOE/CE/23810–11) **Materials Compatibility and Lubricants Research on CFC-refrigerant substitutes: Quarterly technical progress report, 1 January 1993–31 March 1993.** Godwin, D.A.; Hourahan, G.C.; Szymurski, S.R. Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States). Apr 1993. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE93014770. Source: OSTI; NTIS; GPO Dep.

The Materials Compatibility and Lubricants Research (MCLR) program supports critical research to accelerate the introduction of CFC-refrigerant substitutes. The MCLR program addresses refrigerant and lubricant properties and materials compatibility. The primary elements of the work include data collection and dissemination, materials compatibility testing, and methods development. The work is guided by an Advisory Committee consisting of technical experts from the refrigeration and air-conditioning industry and government agencies. Under the current MCLR program the Air-Conditioning and Refrigeration Technology Institute, Inc., (ARTI) is contracting and managing multiple research projects and a data collection and dissemination effort. Detailed results from these projects are reported in technical reports prepared by each researcher.

24005 (DOE/CE/23810–11A) **Solubility, viscosity and density of refrigerant/lubricant mixtures: Quarterly technical progress report, 1 January–31 March 1993.** Henderson, D.R. Spauschus Associates, Inc., Stockbridge, GA (United States); Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States). Apr 1993. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE93014771. Source: OSTI; NTIS; GPO Dep.

This report presents results for low refrigerant concentration (70, 80, 90 and 100 weight percent lubricant) mixtures of the following fluids: CFC-12/ISO 32 naphthenic mineral oil, HCFC-22/ISO 32 naphthenic mineral oil, CFC-12/ISO 100 naphthenic mineral oil, HFC-134a/ISO 22 pentaerythritol ester mixed acid, HFC-134a/ISO 32 pentaerythritol ester mixed acid #1, HFC-134a/ISO 68 pentaerythritol ester mixed acid, HFC-134a/ISO 100 pentaerythritol ester mixed acid, HFC-134a/ISO 32 pentaerythritol ester mixed acid #2, HCFC-123/ISO 32 naphthenic mineral oil, HCFC-123/ISO 100 naphthenic mineral oil, HCFC-123/150 SUS alkylbenzene, HCFC-123/300 SUS alkylbenzene. These data have been reduced to engineering form and are presented in the form of a Daniel Chart. Equations are given along with statistical measures of goodness of fit.

24006 (DOE/CE/23810–11B) **Measurement of viscosity, density and gas solubility of refrigerant blends: Quarterly progress report, 1 January 1993–31 March 1993.** Cavestri, R.C. (Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States)); Munk, J. Imagination Resources, Inc., Dublin, OH (United States); Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States). Apr 1993. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE93014772. Source: OSTI; NTIS; GPO Dep.

Liquid/liquid miscibilities of four different 32 ISO VG polyolesters and one alkylbenzene at three concentrations were determined. Also a full vapor lubricant equilibrium (VLE) viscosity reduction of a 32 ISO VG mineral oil with HCFC-22 is complete. Partial viscosity reduction information by the fractionate components from R-502 in 32 ISO VG mineral oil is presented from 40C (104C) and 70C (158F) isotherms.

24007 (DOE/CE/23810–11C) **Accelerated screening methods for predicting lubricant performance in refrigerant compressors: Quarterly progress reports, 1 October 1992–31 December 1992 and 1 January 1993–31 March 1993.** Cusano, C. Illinois Univ., Urbana, IL (United States). Dept. of Mechanical and Industrial Engineering; Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States). Mar 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE93014773. Source: OSTI; NTIS; GPO Dep.

As the result of a thorough literature search and consultation with manufacturers of compressors, a specimen testing program is proposed to simulate specific contacts in components of compressors. Specimen testing will be conducted using a high pressure tribometer. Specific components to be simulated, with their approximate operating and environmental conditions, are identified. A list of references, related to compressors lubrication, friction and wear, is given in the Appendix.

24008 (DOE/CE/23810–11D) **ARTI Refrigerant Database.** Cain, J.M. (Calm (James M.), Great Falls, VA (United States)). Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States); Calm (James M.), Great Falls, VA (United States). 30 Apr 1993. 121p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE93014774. Source: OSTI; NTIS; GPO Dep.

The Refrigerant Database consolidates and facilitates access to information to assist industry in developing equipment using alternative refrigerants. The underlying purpose is to accelerate phase out of chemical compounds of environmental concern. The database provides bibliographic citations and abstracts for publications that may be useful in research and design of air-conditioning and refrigeration equipment. The complete documents are not included. The database identifies sources of specific information on R-32, R-123, R-124, R-125, R-134, R-134a, R-141b, R-142b, R-143a, R-152a, R-245ca, R-290 (propane), R-717 (ammonia), ethers, and others as well as azeotropic and zeotropic blends of these fluids. It addresses lubricants including alkylbenzene, polyalkylene glycol, ester, and other synthetics as well as mineral oils. It also references documents addressing compatibility of refrigerants and lubricants with metals, plastics, elastomers, motor insulation, and other materials used in refrigerant circuits. Incomplete citations or abstracts are provided for some documents to accelerate availability of the information and will be completed or replaced in future updates.

24009 (DOE/ER/14062–3) **[Time-resolved optical studies of charge relaxation and charge transfer at electrode interfaces].** Pittsburgh Univ., PA (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER14062. Order Number DE93013985. Source: OSTI; NTIS; GPO Dep.

Key components were identified in a quantitative model of carrier relaxation in semiconductor electrodes: nonlinear aspects of nonradiative and radiative recombination, effect of space charge field on carrier dynamics, self-absorption effects in direct gas semiconductors, and influence of surface state population kinetics on charge carrier recombination. For CdSe, the first three are operative (no direct proof of the last one). A realistic kinetic model for carrier recombination in the bulk of CdSe was used which includes important nonlinear effects, both radiative and nonradiative. The change in interfacial recombination velocity with the chemical nature of the sinterface was studied (n-CdSe/silane interfaces). Temperature effect (278 to 328 K) on fluorescence decay of n-CdSe in contact with 0.5 M KOH was found to be weak. An analytical solution was obtained for time-resolved fluoresence from electrodes under potential bias, and is being tested. Fluorescence work on a different material, CdS, indicate different recombination kinetics; this material was used to directly pump an optical transition of a surface state.

24010 (DOE/ER/45125–10) **Structures and shear response of lipid monolayers: Progress report, August 1, 1990–July 31, 1993.** Dutta, P.; Ketterson, J.B. Northwestern Univ., Evanston, IL (United States). Feb 1993. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84ER45125. Order Number DE93015076. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses our work during the last 3 years using x-ray diffraction and shear measurements to study lipid monolayers

(membranes). The report is divided into: (1) structure: phase diagram of saturated fatty acid Langmuir monolayers, effect of head group interactions, studies of transferred monolayers (LB films); (2) mechanical properties: fiber=optic capillary wave probe and centrosymmetric trough, mechanical behavior of heneicosanoic acid monolayer phases. (DLC)

24011 (DOE/ER/45205–8) **High temperature stability, interface bonding, and mechanical behavior in β-NiAl and Ni_3Al matrix composites with reinforcements modified by ion beam enhanced deposition: Progress summary report, June 1, 1993–May 31, 1994.** Grummon, D.S. Michigan State Univ., East Lansing, MI (United States). Dept. of Metallurgy, Mechanics and Material Science. 21 Jan 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER45205. Order Number DE93013977. Source: OSTI; NTIS; GPO Dep.

Diffusion-bonded NiAl-Al_2O_3 and Ni_3Al-Al_2O_3 couples were thermally fatigued at 900 C for 1500 and 3500 cycles. The fiber-matrix interface weakened after 3500 cycles for the Saphikon fibers, while the Altex, PRD-166, and FP fibers showed little, if any, degradation. Diffusion bonding of fibers to Nb matrix is being studied. Coating the fibers slightly increases the tensile strength and has a rule-of-mixtures effect on elastic modulus. Push-out tests on Sumitomo and FP fibers in Ni aluminide matrices were repeated. Al_2O_3 was evaporated directly from pure oxide rod onto acoustically levitated Si carbide particles, using a down-firing, rod-fed electron beam hearth; superior coatings were subsequently produced using concurrent irradiation with 200-eV argon ion-assist beam. The assist beam produced adherent films with reduced tensile stresses. In diffusion bonding in B-doped Ni_3Al matrices subjected to compressive bonding at 40 MPa at 1100 C for 1 hr, the diffusion barriers failed to prevent catastrophic particle- matrix reaction, probably because of inadequate film quality. AlN coatings are currently being experimented with, produced by both reactive evaporation and by N^+-ion enhanced deposition. A 3-kW rod-fed electron-beam-heated evaporation source has been brought into operation.

24012 (DOE/FTR–93012146) **[Cesium Iodide (CsI) crystal manufacture]: Foreign trip report, July 19–29, 1992.** Childress, S.R.; Ray, R.E. Jr. Fermi National Accelerator Lab., Batavia, IL (United States). 28 Aug 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE93012146. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The CsI calorimeter which will be assembled by the KTeV collaboration is 2.0 meters by 2.0 meters square and consists of pure Cesium Iodide crystals. The crystals are 500 mm or 27 radiation lengths long and come in two transverse sizes; 25 mm square and 50 mm square. The crystals may be single units or they may be made from pairs of glued crystals. The mechanical tolerances and light output characteristics required of the crystals by KTeV are fairly stringent and are just at the edge of the state-of-the-art. We have visited the three companies who are bidding on the KTeV CsI order in order to evaluate their abilities to produce crystals sufficient for our purposes as well as to evaluate their production capabilities.

24013 (DOE/FTR–93013395) **Travel to Belgium for the 1992 EuChem Molten Salt Conference: Foreign trip report, March 23–April 3, 1992.** Murray, A.M. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. 6 May 1992. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. Order Number DE93013395. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document is mainly a report on the Euchem Molten Salt conference. (DLC)

24014 (DOE/FTR–93013657) **Travel to Japan to learn about III-V passivation and other III-V processing work, and to participate in the LAMP '92 conference: Foreign trip report, June 6–17, 1992.** Ashby, C.I. Sandia National Labs., Albuquerque, NM (United States). 13 Jul 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013657. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Ashby visited researchers at the University of Tsukuba, NTT LSI Laboratories, and Fujitsu Laboratories to learn more about the mechanisms and processing techniques for electronic passivation of III-V compound semiconductor surfaces and about Fujitsu's application of a modified version of a photochemical process developed by Ashby and coworkers at Sandia. Ashby also presented an invited talk at the Second International Conference on Laser Advanced Materials Processing, which served to showcase Sandia National Laboratories as a premier laboratory in the area of laser processing.

24015 (FhG-IWM-Z–5/90) **Characterising the mechanical properties of carbon fiber reinforced high-output compound materials. Final report.** Thielicke, B.; Soltesz, U. Fraunhofer-Institut fuer Werkstoffmechanik, Freiburg im Breisgau (Germany); Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Mar 1990. 56p. (In German). Contract BMFT 03M1017C. Order Number DE93795318. Source: OSTI; NTIS (US Sales Only).

In the context of the documented investigations, the newly developed compound materials were characterized with regard to their mechanical properties and the failure behaviour depending on the temperature, the ambient conditions and the type of load in different test devices. In the experiments and FE calculations, it was proved that the stresses in these anisotropic materials are very complex even in simple test processes, such as in a 3-point bending test or a 'single axis' tensile test and can lead to complicated stress distributions and superimpositions. The relationship of the strength values on the sample geometry measured in the bending and tensile tests is very frequently connected to a change of the failure process. Other effects are superimposed on the dependence on geometry, which result, from example, from the variation of material properties (compound partner, fibre content, type of reinforcement and fibre matrix adhesion) or stress and ambient conditions. (orig.).

24016 (IAEA-TECDOC–690) **The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.** International Atomic Energy Agency, Vienna (Austria). Feb 1993. [311p.] (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

The meeting was convened by the IAEA on the recommendation of the International Working Group on Gas Cooled Reactors. It was attended by 61 participants from 6 countries. The meeting covered the following subjects: overview of national programs; design criteria, fracture mechanisms and component test; materials development and properties; non-destructive examination, inspection and surveillance. The participants presented 33 papers on behalf of their countries. A separate abstract was prepared for each of these papers. Refs, figs, tabs, photos and diagrams.

24017 (IAEA-TECDOC–690, pp. 49-58) **A microstructurally based fracture model for nuclear graphite.** Burchell, T.D. (Oak Ridge National Lab., TN (United States)). International Atomic Energy Agency, Vienna (Austria). Feb 1993. Contract DE-AC05-84OR21400. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

This paper reports the physical basis of, and assumptions behind, a fracture model for nuclear graphites. Microstructurally related inputs, such as filler particle size, filler particle fracture toughness (K_{Ic}), density, pore size distribution, number of pores and specimen geometry (size and volume), are utilized in the model. The model has been applied to two graphites, Great Lake Carbon Corporation grade H-451 and Toyo Tanso grade IG-110. For each graphite, the predicted tensile failure probabilities are compared with experimental data generated using ASTM Standard C-749 tensile test specimens. The predicted failure probabilities are in close agreement with the experimental data, particularly in the case of H-451. The model is also shown to qualitatively predict the influence on the failure probabilities of changes in filler particle size, density, pore size, pore size distribution, number of pores and

specimen geometry (stressed volume). The good performance is attributed to the sound physical basis of the model, which recognizes the dominant role of porosity in controlling crack initiation and propagation during graphite fracture. (author). 8 refs, 12 figs, 1 tab.

24018 (IAEA-TECDOC–690, pp. 59-63) **Burst tests to measure the tangential strength of CFC tubes.** Roedig, M. (Forschungszentrum Juelich GmbH (Germany). Inst. fuer Reaktorwerkstoffe); Woschek, B.; Baur, W. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

Carbon fiber reinforced composites (CFC) are considered as graphite/metal substitute material for certain structural components in modern HTR design. Internal pressure tests have been performed with tube segments made of CFC. The aim of the investigations was to value the failure of components under hoop stress and to compare the results to those obtained in relatively simple tests as split disk tests. The internal pressure was generated by gas and water. The main problem in the experiments was to prevent leakage at the end of the tubes without applying uncontrolled bending moments. Design methods supported by finite element calculations, helped to reduce these bending moments which could not be avoided totally however. Therefore the results of the burst tests must be considered as conservative. But compared to the split disk tests, the failure stress is twice as high as for the latter. Therefore it can be assumed, that for the given geometry, the split disk tests underestimate the tangential strength at least by a factor of two. (author). 9 figs.

24019 (IAEA-TECDOC–690, pp. 64-69) **Spatial variability in the tensile strength of an extruded nuclear-grade graphite.** Strizak, J.P. (Oak Ridge National Lab., TN (United States)). International Atomic Energy Agency, Vienna (Austria). Feb 1993. Contract DE-AC05-84OR21400. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

This report will present the results of a study on spatial variations in the strength of nuclear-grade H-451 graphite. The tensile properties of H-451 were examined extensively in the past in order to characterize the variability of strength within billets, between billets and between lots. But the variability within a billet was, for the most part, studied only casually. The problem appeared to be the strong influence of a limited sampling plan in describing the mean strength and the variability. Therefore, an extensive, statistically sound sampling plan has been devised to fully characterize the spatial variability within a single billet. Test specimens were machined to conform to ASTM C749-87, "Standard Test Method for Tensile Stress-Strain of Carbon and Graphite". Test results have been obtained for four specimen sizes having gage diameters of 6.35, 9.53, 15.88, and 25.40 mm with respective gage-section volumes of 1407, 3163, 12,577, and 51,482 mm^3. A new fracture model developed by Burchell was applied to the data with encouraging results. This probabilistic failure criteria combines a microstructural basis with a fracture-mechanics approach to failure. (author). 8 refs, 20 figs, 1 tab.

24020 (IAEA-TECDOC–690, pp. 123-133) **Fabrication of HTGR core components by the method of volume gas-phase impregnation of porous media with pyrocarbon - main characteristics of the materials and products.** Zelenskij, V.F. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Gurin, V.A.; Konotop, Yu.F.; Deryuga, Yu.A.; Kolosenko, V.V. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

Considered are some special features of fabricating carbon-graphite materials and products by methods of volume gas-phase impregnation of porous substances with pyrocarbon. Main characteristics of the materials of this class are given. Results from reactor tests of the materials and products with a pyrocarbon binder as well as their possible applications are discussed. (author). 9 refs, 11 figs, 4 tabs.

24021 (IAEA-TECDOC–690, pp. 134-139) **Development of graphite for fuel element sleeves in advanced gas cooled reactors.** Burridge, D.P. (British Nuclear Fuels plc, Salwick (United Kingdom). Fuel Engineering Dept.); Naylor, J.E. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

The graphite sleeve is the prime structural member of the advanced gas cooled reactor (AGR) fuel element in that each sleeve supports the pin cluster and all of the fuel assembly above it. It must have a low oxidation rate, a low permeability to maintain coolant flow in the channel, must be dimensionally stable within certain limits and have sufficient strength at the end of life to sustain refuelling operations. The paper describes a development programme covering design and improved graphite. Data is presented which is related to that anticipated in reactor behaviour of the material. It then proceeds to identify the quality assurance requirements of the sleeve material. Graphite sleeves produced from this programme of work are currently being irradiated as pilot loadings in UK reactors. (author). 5 refs, 4 figs, 4 tabs.

24022 (IAEA-TECDOC–690, pp. 140-146) **Mechanical properties and thermal shock resistances of recently developed high performance graphites.** Sato, S. (Ibaraki Univ., Hitachi (Japan). Faculty of Engineering); Kawamata, K.; Kurumada, A.; Chiba, A. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

Recently, owing to the improvement of coke properties and the advances in arrangements and molding techniques, many graphite products possessing superior mechanical and physical properties have been developed. These graphite products are being used in metallurgy and new advanced technological fields, such as semiconductor industry, aerospace rockets and first wall of plasma-facing nuclear fusion devices. At present, the candidate for use as principal core construction material in JAERI's High Temperature Engineering Testing Reactor (HTTR) is generally regarded as the isostatically molded near isotropic graphite, IG-110. For use in HTTR, it is desirable that the graphite material possesses superior mechanical and physical properties, as well as the ability to minimize neutron irradiation damage during reactor operations. This report introduces the experimental results of recent studies on the mechanical properties especially, their strength against thermal stress, fracture toughness and, for part of the graphites, the effects of neutron irradiation and thermal shock resistance of several representative graphite brands. Comparisons are made with those of IG-110. From these experimental results, these several brands of graphites appear to have far superior properties compared to IG-110. Therefore it can be expected that, following future construction of the HTTR and during the stage of its operational tests, these high-performance graphites may have an opportunity to be utilized as the core graphite component to replace IG-110. (author). 16 refs, 1 fig., 2 tabs, 2 photos.

24023 (IAEA-TECDOC–690, pp. 177-182) **Effect of atmosphere on the bend strength of nuclear graphite.** Maruyama, T. (Power Reactor and Nuclear Fuel Development Corp., Oarai,

Ibaraki (Japan). Oarai Engineering Center). International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

Investigations were made of the effects of test environments on bend strength and fracture toughness of fine-grained isotropic graphites. Four-point bend tests were carried out in various atmospheres of air, helium and vacuum. When room temperature bend tests were carried out for specimens which had been outgassed in vacuum at high temperature, we obtained higher values than those measured in air by up to 45%. When measurements were made in helium atmosphere containing 1 to 3 ppm of water vapor, bend strength was higher by 20 to 30% than those measured in air. When water content in helium increased to about 20 ppm, the strength became the same with that measured in air. The high temperature bend strength of graphite specimens generally increased with increasing temperature up to 1200 deg. C if it had not been outgassed at 1200 deg. C. Whereas, the bend strength of specimens which had been outgassed at 1200 deg. C showed high room temperature strength followed by negative temperature dependence up to 900 deg. C, and then became temperature independent up to 1200 deg. C. The fracture toughness of fully outgassed specimens measured in vacuum had higher values by about 20% than that measured in air. (author). 11 refs, 5 figs, 4 tabs.

24024 (IAEA-TECDOC–690, pp. 149-158) **Behavior of gas desorption and gas permeability of carbon materials.** Okada, M. (Toyo Tanso Co., Ltd, Mitoyo, Kagawa (Japan)); Sogabe, T. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

Carbon materials rather easily adsorb and desorb gases such as hydrocarbons, H_2, H_2O, CO and alcohols. It is very important to study the behaviour of gas desorption and gas permeability of carbon materials, especially when they are used in a vacuum vessel or a closed system. Gas desorption was studied by using Thermal Desorption Spectroscopy. Gas desorptions from isotropic graphites, Felt-C/C and B_4C graphite materials were measured. Thermal desorption spectra were obtained from IG-11, IG-110 and IG-110U graphites with a total ash content of 400 ppm, 10 ppm and 2 ppm, respectively. (author). 13 refs, 21 figs, 5 tabs.

24025 (IAEA-TECDOC–690, pp. 183-192) **Corrosion tests of matrix graphites.** Vavilin, A.I. (Scientific and Industrial Association 'Lutch', Podol'sk (Russian Federation)); Kulikov, E.T.; Mozzherin, S.I.; Chernikov, A.S. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

The results of corrosion tests of matrix graphites based on calcinated (30PG graphite) and non-calcinated (MPG graphite) petroleum cokes in the temperature range 600-1200 deg. C and at the water vapour concentration in helium 0.01-1 vol.% are considered. Empirical expressions of the corrosion rate are obtained. Investigation results of matrix-graphite phase-components reactivity are considered. It is shown that the filler graphite 30PG has the minimum activity towards the water vapour. The influence of helium pressure at the constant partial pressure of water vapour, porous structure and of the impurities' content on the matrix graphite oxidation rate are considered. The results of corrosion tests of irradiated specimens of 30PG matrix graphite are given. (author). 3 refs, 7 figs, 4 tabs.

24026 (IAEA-TECDOC–690, pp. 233-241) **The effect of volume on the tensile strength of several nuclear-grade graphites.** Strizak, J.P. (Oak Ridge National Lab., TN (United States)). International Atomic Energy Agency, Vienna (Austria). Feb 1993. Contract DE-AC05-84OR21400. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

This report presents the results of a study on the effects of stress volume on the tensile strength of two nuclear-grade graphites. The materials selected were H-451, an extruded near-isotropic graphite manufactured by Great Lakes Carbon Corporation, and IG-110, a fine-grained isotropic molded graphite manufactured by Toyo Tanso Company, Ltd. The tensile properties of H-451 were examined extensively in the past in order to characterize the variability of strength within billets, between billets, and between lots. But, the variability within a billet was, for the most part, studied only casually. The problem was the strong influence of a limited sampling plan in describing the mean strength and the variability. Therefore, an extensive, statistically sound sampling plan has been devised to fully characterize the spatial variability within a single billet. The effects of stress volume are being reexamined by comparing the strengths of four specimen sizes covering a broad range in stress volume. Test results for four specimen sizes having gage diameters of 6.35, 9.53, 15.88, and 25.40 mm are reported for H-451 graphite. Likewise, tensile test results for the isotropic, high strength IG-110 graphite are reported. 9 refs, 24 figs, 1 tab.

24027 (IAEA-TECDOC–690, pp. 241-248) **The effects of specimen geometry and size on the fracture toughness of nuclear graphites.** Romanoski, G.R. (Oak Ridge National Lab., TN (United States)); Burchell, T.D. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

In a joint Oak Ridge National Laboratory (ORNL)/Japan Atomic Energy Research Institute (JAERI) study, various fracture toughness techniques were applied to Toyo Tanso grade IG-110 graphite to establish if specimen geometry influences on fracture toughness. The test geometries investigated were: compact tension (CT), disc compact tension (DCT), short rod (SR), chevron-notched short-rod (CNSR), cylindrical bend specimen (BS), and centrally slotted disc (CSD). Specimen geometries which allow slow crack propagation, such as the CNSR and CT, yielded higher fracture toughness values than those where fracture is very rapid, e.g., the CSD. In a further ORNL study, the CNSR specimen geometry was selected to investigate the effect of specimen size on fracture toughness. Three specimen sizes and three grades of graphite were examined: Great Lakes Carbon grade H-451, Stackpole grade 2020, and Toyo Tanso grade grade IG-110. Grade H-451 was the toughest graphite, while Stackpole 2020 was the least tough. Fracture toughness increased with increasing specimen size for all graphites tested. This result was attributed to rising R-curve behavior. (author). 13 refs, 8 figs, 3 tabs.

24028 (IAEA-TECDOC–690, pp. 248-255) **Cumulative fatigue damage on HTGR graphite.** Ishiyama, S. (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Dept. of High Temperature Engineering); Eto, M. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

To investigate the effect of cyclic ratio and stress history on cumulative fatigue damage on fine-grained isotropic nuclear graphite,

two step fatigue tests were performed by the loading patterns in which peak load was changed from high level to low one (High-Low mode) and low level to high one (Low-High mode). From those results, the following conclusions were derived: (1) In High-Low mode, remarkable regeneration of stress history of first step loading to fatigue damage of second step were observed at first cyclic ratio of 0.1. (2) Cumulative fatigue damage of High-Low mode was well expressed as the following equations: $D_1+D_2=1$, $D_1=n_1/N_{f1}$, $D_2=n_2/(N_{f1}+N_{f2})A(n_1/N_{f1})^{(B)}$ where A and B are constants; (3) Cumulative fatigue damage of Low-High mode was well expressed as the following equations: $D_1+D_2=1$, $D_1=n_1/N_{f1}$, $D_2=n_2/(N_{f2}+N_{f1})C(n_2/N_{f2})^D$ where C and D are constants. (author). 7 refs, 9 figs, 2 tabs.

24029 (IAEA-TECDOC–690, pp. 256-261) **Fracture behavior of nuclear graphites under compressive impact loading.** Ugachi, H. (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Dept. of High Temperature Engineering); Ishihara, M.; Ishiyama, S.; Eto, M. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

Compressive impact fracture behavior of two kinds of nuclear grade graphites, fine-grained isotropic IG-11 graphite and coarse-grained near-isotropic PGX graphite, have been investigated as a function of various strain rates up to more than 100 (1/s) at room temperature. Two types of cylindrical specimens, 12.5 mm in diameter with 25 mm length and 25 mm in diameter with 50 mm length, were employed to investigate the volume effect on compressive impact strength. Compressive fracture load, longitudinal and circumferential strains were measured in this test. The effect of strain rate up to 100(1/s) on compressive strength and deformation behavior of these graphites are discussed and the following conclusions were derived: (1) Compressive strength of graphites increased with increasing of strain rate up to 100(1/S) and is well expressed by the following equation: $\sigma_C=A\epsilon^B$ where σ_C, ϵ are compressive strength and strain rate and A and B are constants respectively. (2) Compressive strength decreased drastically with increasing of strain rate over 100(1/S). (3) Specimen volume effect on impact compressive strength and deformation behavior was not found. (author). 7 refs, 7 figs, 1 tab.

24030 (IAEA-TECDOC–690, pp. 299-303) **The correlation of hardness with Young's modulus and strengths of nuclear carbon materials.** Oku, T. (Ibaraki Univ., Hitachi, Ibaraki (Japan). Dept. of Mechanical Engineering); Ohta, S.; Eto, M. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

Since mechanical properties of carbon materials are, in general, necessary and important for the structural design of the components of HTGRs, much data on each candidate material has been obtained so far. A correlation between Vickers hardness and strengths of different grades of graphite has been examined and as a result a good correlation with compressive strength was found. According to recent results of the instrumented hardness test that enables to measure the load and the depth continuously, some parameters obtained from the load versus depth relation had good correlations with Young's modulus and strengths. Also correlations of the harness value with Young's modulus, bending strength and compressive strength were examined on the different kinds of carbon materials including the nuclear grades of graphite. As a result, the hardness values defined in the instrumented microhardness test, as well as the normal Vickers hardness value, had comparatively good correlations with Young's modulus, bending strength and compressive strength. (author). 4 refs, 7 figs, 1 tab.

24031 (IAEA-TECDOC–690, pp. 219-225) **Capsule design, fabrication and irradiation for tensile creep test on HTGR graphites at 1200 deg. C in the JMTR.** Saito, T. (Japan Atomic Energy Research Inst., Oarai, Ibaraki (Japan). Oarai Research Establishment); Kikuchi, T.; Arai, T.; Ugachi, H. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists' meeting held in Tokai, Japan, 9-12 September 1991.* [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

An irradiation creep test under uniaxial tension in JMTR has been performed by JAERI as one of the collaborative efforts on HTGR graphite development and testing with USDOE. The purpose of the test is to determine secondary creep coefficients at 1200 deg. C of isotropic IG-110 graphite and near-isotropic H-451 graphite. The irradiation capsule has withstood so far c.a. 1600 EFPH irradiation in JMTR. The paper describes the outline of the design, fabrication and operational progress of the capsule designated as Capsule 89M-6A. Thermal and structural designs were devised to achieve the good thermal insulation and the mechanical integrity of key components inside the capsule. Seven dogbone type tensile specimens were encapsulated together with other unstressed control specimens. The specimen temperature control system and load control system are similar to those utilized in the previous creep tests. In the course of three irradiation cycles in JMTR, the graphite specimens have been subjected to nearly constant temperatures and the specified tensile load. The capsule will be unloaded after another irradiation cycle. (author). 9 refs, 9 figs, 1 tab.

24032 (INIS-JP–007, pp. 620-624) **Ion beam techniques for analyzing polymers irradiated by ions.** Rickards, J. (Universidad Nacional Autonoma de Mexico, Mexico City (Mexico). Inst. de Fisica); Zironi, E.P.; Andrade, E.; Dominguez, B. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 817p. (CONF-911154–: International conference on evolution in beam applications, Takasaki (Japan), 5-8 Nov 1991). In *Proceedings of the international conference on evolution in beam applications.* Order Number DE93703820. Source: OSTI; NTIS; INIS.

In the study of the effects of ion beam irradiation of polymers very large doses can be administered in short times. Thousands of MGy can be produced in a small volume of a sample in a few minutes by bombarding with typical ion beam currents. For instance, in an experiment done to observe the effects of 750 keV proton irradiation PVC, using a collimator of 1 mm diameter, 1 μC of charge integration deposits a dose of 50 MGy. The use of ion beams also opens up the possibility of using the same beam for irradiation and for analysis of the effects, using the well known ion beam analysis techniques. PIXE allows the measurement of chlorine in PVC. Polymers containing fluorine can be measured with the resonant nuclear reaction (RNR) technique, which is specific only to certain elements. The amount of hydrogen in the sample and its profile can be obtained using energy recoil detection analysis (ERDA); carbon, oxygen, and nitrogen can be measured and profiled using Rutherford backscattering (RBS) and also using the (d,p) and (d, α) nuclear reactions (NR). Loss of mass is one effect that can be studied using these techniques. It was studied in two different polymers, PVC and CR-39, in order to determine carbon buildup during ion irradiation. It was concluded that carbon builds up following different mechanisms in these two materials, due to the different possibilities of forming volatile compounds. It is also suggested that CR-39 should be a good material for ion beam lithography. (author).

24033 (IS-T–1609) **Low temperature pathways to Chevrel phases via reduced molybdenum sulfide cluster complexes.** Shane, H. Ames Lab., IA (United States). 30 Mar 1993. 234p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. Order Number DE93013282. Source: OSTI; NTIS; GPO Dep.

The initial cluster compound, $Na_{2y}Mo_6S_{8+y}$ $(py)_x$, was discovered by reacting Mo_6Cl_{12} with higher stoichiometries of sodium hydrosulfide and sodium butoxide in butanol/pyridine. This compound can subsequently undergo ligand exchange reactions to form a variety of cluster complexes. Single-crystal structure determinations are reported for the pyridine (py), piperidine (pip), and pyrrolidine (pyrr)

complexes: triclinic $Mo_6S_8(PY)_6 \cdot 1.65py$, cubic $Mo_6S_8(py)_6 \cdot 2py$, $Mo_6S_8(pip)_6 \cdot 7pip$, and $Mo_6S_8(pyrr)_6 \cdot 1pyrr$. Delegation of the cluster complexes was explored. Direct heating under dynamic vacuum led to incomplete deligation. Reactions with tin and lead resulted in formation of corresponding Chevrel phase compounds along with MoS_2. Thermolysis reactions in the presence of flowing ammonia gas resulted in further delegation than was evidenced for reactions explored in vacuo. Solution reactions with strong acids were studied in an attempt to protonate the ligands and thus make them better leaving groups only limited success was achieved. A new preparative route was developed for ternary molybdenum sulfides. Cation exchange reactions with $Na_{2y}Mo_6S_{8+y}(MeOH)_x$ were used to form the cobalt, tin, lead, and holmium compounds. Preliminary hydrodesulfurization studies on the sodium and cobalt compounds showed that they possess larger surface areas and thiophene conversion percentages than Chevrel phases, but a lower HDS rate.

24034 (JAERI-M–93-013) **Chemical analysis of high purity graphite: Preparation of certified reference materials and development of analytical methods.** Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1993. 123p. (In Japanese). Order Number DE93797598. Source: OSTI; NTIS; INIS.

The Sub-Committee on Chemical Analysis of Graphite was organized in April 1989, under the Committee on Chemical Analysis of Nuclear Fuels and Reactor Materials, JAERI. The Sub-Committee carried out collaborative analyses among eleven participating laboratories for the certification of the Certified Reference Materials (CRMs), JAERI-G5 and G6, after developing and evaluating analytical methods during the period of September 1989 to March 1992. The certified values were given for ash, boron and silicon in the CRM based on the collaborative analysis. The values for ten elements (Al, Ca, Cr, Fe, Mg, Mo, Ni, Sr, Ti, V) were not certified, but given for information. Preparation, homogeneity testing and chemical analyses for certification of reference materials were described in this paper. (author) 52 refs.

24035 (LA-UR–93-1618) **Schemes for the use of conducting polymers as active materials in electrochemical supercapacitors.** Rudge, A. (Los Alamos National Lab., NM (United States)); Davey, J.; Gottesfeld, S.; Ferraris, J.P. Los Alamos National Lab., NM (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930571–14: 183. Electrochemical Society meeting, Honolulu, HI (United States), 16-21 May 1993). Order Number DE93012713. Source: OSTI; NTIS; GPO Dep.

The development of a novel conducting polymer based system for use in electrochemical capacitors is described. This system utilizes a new conducting polymer, poly-3-(4-fluorophenyl)-thiophene (PFPT), that can be reversibly n- and p-doped to high charge density. The electrochemical n-dopability of this material can be further improved by cycling in acetonitrile solution that contains a new electrolyte, tetramethylammonium trifluoromethanesulfonate ($Me_4NCF_3SO_3$). We discuss these improvements in n-dopability in terms of potential electronic and steric influences. We believe that the substituent fluorophenyl group does not communicate with the polythiophene backbone through resonance, and conclude that the ability to n-dope PFPT to high charge density may occur as a result of electron transfer reactions from the conducting polymer backbone into the substituent. This new system for electrochemical capacitors provides the best achievable performance from conducting polymers and generates high energy and power densities that are comparable with noble metal oxide systems, potentially at a fraction of the cost.

24036 (NAL-TR–1159) **Evaluation of test specimen shape effects on the flexural fatigue of CFRP laminates.** Noguchi, Y. (National Aerospace Laboratory, Tokyo (Japan)). National Aerospace Lab., Chofu, Tokyo (Japan). May 1992. 17p. (In Japanese). Order Number DE93793622. Source: OSTI; NTIS; Available from National Aerospace Laboratory, 44-1, Shindaiji Higashicho 7-chome, Chofu-City, Tokyo, Japan.

An investigation was made on relationship between a flexural fatigue test and test specimen shapes of carbon fiber reinforced plastic (CFRP). Five kinds of material were tested including carbon fibers with medium strength, high ductility, and high strength, cross-ply laminates as pre-preg base materials using epoxy resin for raw material, and pseudo isotropic laminates. Static bending test and flexural fatigue test were carried out for dynamic characteristics to derive the relationship (S-N line) between iterative bending stress and the number of repetition before breakdown. Comparison of the test results arrived at the following conclusions: The high-ductility and high-strength laminates exhibited significant difference in the S-N inclination, which is because of local compression breakdown at edges of the laminates; the flexural fatigue strength is compared in a descending order as the medium-strength laminates, high-ductility laminates, high-strength laminates, high-strength pseudo isotropic laminates, and medium-strength fabric laminates. The static bending strength was in the order of the high-strength laminates, high-ductility laminates, high-strength pseudo isotropic laminates, and medium-strength fabric laminates. 12 refs., 16 figs., 2 tabs.

24037 (NAL-TR–1160) **Tribological characteristics of hot-pressed self-lubricating composites.** Suzuki, M. (National Aerospace Laboratory, Tokyo (Japan)); Nishimura, M. National Aerospace Lab., Chofu, Tokyo (Japan). May 1992. 48p. (In Japanese). Order Number DE93793623. Source: OSTI; NTIS; Available from National Aerospace Laboratory, 44-1, Shindaiji Higashicho 7-chome, Chofu-City, Tokyo, Japan.

With an objective to develop lubricating materials for space applications with superior tribological characteristics, a hot press process was used to fabricate composite materials composed of MoS2, refractory metal oxides (MoO3, WO3, Ta2O5, and Nb2O5) and refractory metals (Nb, Mo, W and Ta). The composite materials were subjected to wear tests in a vacuum, N2 gas, and atmosphere. The best material composition under the sliding condition (face pressure at 0.5 MPa to 4 MPa and sliding velocity at 0.11 m/s to 0.55 m/s) was found to be MoS2 80% + MoO2 10% + Nb 10% (with a friction coefficient of 0.07 or lower and a specific friction amount of 10^{-11} $mm^3/mm \cdot N$ or less in a vacuum). Good tribological performance was also obtained with MoS2 80% + Nb2O5 10% + Nb 10% and MoS2 80% + MoO2 10% + Mo 10%. A feature common to the good composite materials is forming of uniform transfer film on surface of the opponent material. It was found that MoS2 decomposes producing Mo2S3 during hot-pressing the composite material. Greater wear in the atmosphere is because of production of MoO2 during friction. The effect of MoO2 addition is estimated to be in accelerating the MoS2 decomposition. 34 refs., 59 figs., 7 tabs.

24038 (NEI-NO–329) **Electrical and optical properties of multiple quantum well structures and their applications to infrared detectors.** Helgesen, P. Oslo Univ. (Norway). Apr 1992. [85p.] Order Number DE93625581. Source: OSTI; NTIS; INIS.

Reprints of seven previously printed papers are attached.

In this work the author investigate the subband nature of multiple quantum well structures by photoconductance spectroscopy, optical absorption measurements and tunneling experiments. Both interband and intraband transitions have been studied. The work is aimed at making an infrared detector using wide band gap semiconductors. 14 refs.

24039 (ORNL/FTR–4331) **[Travel to Germany for studies on carbon materials technology]: Foreign trip report, June 17–July 6, 1992.** Fuller, E.L. Jr. Oak Ridge National Lab., TN (United States). 21 Jul 1992. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012688. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Details of the traveler's meetings with research workers in Germany are reported. The meetings, held under the auspices of international agreements, were concemed with the exchange of data and technical information on graphite for high-temperature gas-cooled nuclear reactors. The presentations and ensuing discussions were eminently relevant and extremely beneficial to the traveler's research Work for the Modular High-Temperature Gas-Cooled Reactor (MHTGR) technology development program at Oak Ridge National Laboratory (ORNL).

24040 (ORNL/FTR–4388) **[Travel to Germany to attend the Third international conference on the new diamond science and technology]: Foreign trip report, August 29–September 10, 1992.** Clausing, R.E. Oak Ridge National Lab., TN (United States). 23 Sep 1992. 10p. Sponsored by USDOE, Washington,

DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012111. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The conference and the post-conference visits allowed the traveler to access the status of CVD optical applications and structure control. It is apparent that at this time we, at ORNL, can grow and control a much wider range of CVD diamond textures than any other lab, however, we have strong competition in that the microwave technique of Koidl is able to exert very fine control of the growth of <100> textured material and that using the microwave techniques he can grow the material over a relatively wide range of temperatures. He has a fine staff and excellent facilities. We have planned collaborative activities to explore, differences in our techniques and results with both Koidl and Bachmann.

24041 (PNL-SA–21236) **Atomic polar tensors and acid-base properties of metal-oxide building blocks.** Ferris, K.F. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-921101–113: 16. Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting, Boston, MA (United States), 30 Nov - 5 dec 1992). Order Number DE93011034. Source: OSTI; NTIS; INIS; GPO Dep.

The sensitivity of the atomic polar tensor to compositional substituents is reported for the alkali silicate series. Rotational invariants, effective atomic charge (GAPT) and charge normalized anisotropy and dipole (α_n and γ_n) are used to characterize the charge distribution and chemical environment of the atomic sites. Comparison of α_n and γ_n with a series of known Bronsted and Lewis acids and bases suggests that these rotational invariants may act as indicators for metal-oxide site acidities. Basis set and electron correlation particularly affect the determined effective charge, but show minimal effect on α and γ quantities.

Material Research Society international symposium on the scientific basis for nuclear waste management fall meeting, Boston, MA (United States), 30 Nov - 5 dec 1992). Order Number DE93011035. Source: OSTI; NTIS; INIS; GPO Dep.

Surface defects both focus the local electric field and enhance its intensity in the vicinity of the defect Using a finite element model of an inhomogeneous dielectric film, we have examined the relationship between the defect shape and local electric field in the film and defect. We find that raised defect regions that are peaked have the largest local fields while the slope of removed regions has little effect on the field in raised defects. Both peaked and flat surface defects can lead to large enhancements of the local electric field above that predicted by effective medium approximation (EMA) methods.

24043 (PNL-SA–21812) **Sensing glass transitions in thin polymer films on acoustic wave microsensors.** Grate, J.W. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930398–2: American Society of Testing and Materials (ASTM) meeting on glass transition, Atlanta, GA (United States), 4-5 Mar 1993). Order Number DE93010805. Source: OSTI; NTIS; GPO Dep.

Acoustic wave microsensors are capable of sensing transition behaviors of homogeneous amorphous polymers applied as thin films to the surface of the sensors. The device and wave characteristics of four such microsensors, and examples of their uses in monitoring polymer properties, are described. The devices are the thickness-shear mode (TSM), surface acoustic wave (SAW), flexural plate wave (FPW), and shear horizontal acoustic plate mode (SH-APM) devices. Using the FPW device, the change in the polymer coefficient of thermal expansion at the static glass transition temperature is sensed as a change in slope of the frequency-temperature plot. This behavior reflects the fact that the frequency measures acoustic velocity, which decreases as the polymer modulus decreases. Modulus decreases as the polymer volume increases. Frequency-dependent relaxation properties are detected with a sigmoidal change in slope of the frequency-temperature plot and a maximum in signal amplitude. The minimum in signal amplitude is analogous to the maximum in the loss tangent in dynamic mechanical analysis, or the maximum in sound damping in bulk-wave ultrasonic studies.

24044 (SAND–92-0824C) **Free-exciton recombination in GaAs.** Wolford, D.J. (Thomas J. Watson Research Center, Yorktown Heights, NY (United States)); Gilliland, G.D.; Kuech, T.F.; Bradley, J.A.; Hjalmarson, H.P. Sandia National Labs., Albuquerque, NM (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. Contract N00014-85-C-0868;Contract N00014-90-C0077;Contract N000 (CONF-930880–3: International conference on the physics of semiconductors, Beijing (China), 10-14 Aug 1993). Order Number DE93009843. Source: OSTI; NTIS; GPO Dep.

We have studied the kinetics of free-exciton recombination in "ideal" GaAs structures. Our studies include detailed photoluminescence kinetics measurements versus laser excitation power, temperature, sample structure, and surface treatment. The primary goal in these studies is to understand the mechanism precipitating free-exciton recombination, and the role, if any, that polaritons play. Additionally, we have assessed the effects free-carriers and a variety of different sample structures and surface treatments have on these kinetics.

24045 (SAND–92-0825C) **Anomalous low-temperature free-exciton transport in GaAs structures.** Wolford, D.J. (T.J. Watson Research Center, Yorktown Heights, NY (United States). IBM Research Div.); Gilliland, G.D.; Kuech, T.F.; Bradley, J.A.; Hjalmarson, H.P. Sandia National Labs., Albuquerque, NM (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. Contract N00014-85-C-0868;Contract N00014-90-C-0077;Contract N00 (CONF-930880–2: International conference on the physics of semiconductors, Beijing (China), 10-14 Aug 1993). Order Number DE93009845. Source: OSTI; NTIS; GPO Dep.

Using an optical analogue to the classical Haynes-Schockley experiment, we have studied low-temperature free-exciton transport in several "ideal" GaAs structures. We find the observed diffusion constants to be laser excitation power dependent below 50 K, and independent of laser power at higher temperatures. We observe peak 2 K diffusivities of > 1000 cm^2/Vs. Possible mechanisms are discussed.

24046 (SAND–92-2498C) **Crack suppression in GaInSb buffer layers initially under tensile stress.** Drummond, T.J.; Lee, S.R. Sandia National Labs., Albuquerque, NM (United States). [1992]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930405–2: Spring meeting of the Materials Research Society, San Francisco, CA (United States), 12-16 Apr 1993). Order Number DE93012839. Source: OSTI; NTIS; GPO Dep.

Epitaxial III-V compound semiconductor buffer layers typically relieve tensile stress by mixed crack and misfit dislocation formation. Crack suppression by p-doping GaInSb step graded buffers grown on InSbsubstrates by MBE is demonstrated. This complements a similar demonstration for InAsSb buffers grown by MOCVD. The depth dependence and reproducibility of the stress relaxation have been quantified using a novel k-map x-ray analysis. A model in which the p-doping enhances the nucleation and subsequent climb of dislocations has been formulated to explain the result. This model should also apply to other III-V buffer systems such as GaAsP/GaAs and InGaAs/InP.

24047 (SAND–93-0609C) **Intrinsic and interfacial recombination in OMVPE- and MBE-prepared $GaAs/Al_xGa_{1-x}As$ heterostructures.** Gilliland, G.D. (International Business Machines Corp., Yorktown Heights, NY (United States). Thomas J. Watson

Research Center); Wolford, D.J.; Kuech, T.F.; Bradley, J.A.; Klem, J.; Hjalmarson, H.P. Sandia National Labs., Albuquerque, NM (United States); International Business Machines Corp., Yorktown Heights, NY (United States). Thomas J. Watson Research Center. [1993]. 4p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. Contract N00014-85-C-0868;Contract N00014-90-C-0077;Contract N00 (CONF-930880–1: International conference on the physics of semiconductors, Beijing (China), 10-14 Aug 1993). Order Number DE93009844. Source: OSTI; NTIS; GPO Dep.

We have studied intrinsic free-carrier recombination in a variety of GaAs structures, including: OMVPE- and MBE-prepared GaAs/$Al_xGa_{1-x}As$ double heterostructures, Na_2S passivated GaAs structures and bare GaAs structures. We find OMVPE prepared structures are superior to all of these other structures with 300 K lifetimes of $\sim$ 2.5 μs and negligible nonradiative interface and bulkrecombination, and thus are truly surface-free ($S < 40$ cm/s). Moreover, we observe systematic trends in optical properties versus growth conditions. Lastly, we find that the presence of free-exciton recombination in the low-temperature photoluminescence spectra is a necessary but not sufficient condition for optimal optical properties (i.e. long minority-carrier lifetimes).

24048 (SAND–93-0825C) **Preparation of carbon monoliths having tailored pore structure from porous polymer precursors.** Lagasse, R.R. Sandia National Labs., Albuquerque, NM (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930615–1: Biennial conference on carbon, Buffalo, NY (United States), 13-18 Jun 1993). Order Number DE93011576. Source: OSTI; NTIS; INIS; GPO Dep.

This work concerns preparing tailored porous carbon monoliths by pyrolyzing porous polymer precursors. Prior work in this laboratory (1) demonstrated that a low density (0.05 g/cm^3), high void fraction (97 vol%) carbon monolith could be prepared by pyrolyzing a porous poly(acrylonitrile) (PAN) precursor. A higher density, more robust carbon material is preferred for certain applications, such as electrodes for electrochemical devices. The present work demonstrates that porous carbon monoliths having mass density of 0.7 g/cm^3 can be prepared from a porous PAN precursor if the pyrolysis is controlled carefully. The macropore structure of the carbon is adjusted by changing the pore structure of the PAN precursor, and the finer scale structure (such as the crystallite size L_c) is adjusted by varying the pyrolysis or heat treatment temperature.

24049 (SAND–93-0826C) **Correlations of the growth, structure and stress with the adhesion of diamond films on tungsten.** Alam, M. (New Mexico Inst. of Mining and Technology, Socorro, NM (United States). Dept. of Materials Engineering); Peebles, D.E.; Tallant, D.R.; Ohlhausen, J.A. Sandia National Labs., Albuquerque, NM (United States). [1993]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930419–1: International conference on metallurgical coatings and thin films, San Diego, CA (United States), 19-23 Apr 1993). Order Number DE93012855. Source: OSTI; NTIS; GPO Dep.

Diamond films were deposited on tungsten substrates by a filament-assisted chemical vapor deposition process as a function of seven different processing parameters. The effect of variations in measured film characteristics such as growth rate, texture, diamond-to-nondiamond carbon Raman band intensity ratio and strain on the adhesion between the diamond film/tungsten substrate pairs as measured by a tensile pull method were investigated. The measured adhesion values do not correlate with any of the measured film characteristics mentioned above. The problem arises because of the non-reproducibility of the adhesion test results, due to the non-uniformity of film thickness, surface preparation and structural homogeneity across the full area of the substrate.

24050 (SAND–93-1020C) **Rapid thermal processing for strained-layer semiconductor devices.** Zolper, J.C.; Myers, D.R. Sandia National Labs., Albuquerque, NM (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930405–6: Spring meeting of the Materials Research Society, San Francisco, CA (United States), 12-16 Apr 1993). Order Number DE93013754. Source: OSTI; NTIS; GPO Dep.

Strained-layer semiconductors have revolutionized modern heterostructure devices by exploiting the modification of semiconductor band structure associated with the coherent strain of lattice-mismatched heteroepitaxy. The modified band structure improves transport of holes in heterostructures and enhances the operation of semiconductor lasers. Strained-layer epitaxy also can create materials whose band gaps match wavelengths (e.g. 1.06 μm and 1.32 μm) not attainable in ternary epitaxial systems lattice matched to binary substrates. Other benefits arise from metallurgical effects of modulated strain fields on dislocations. Lattice mismatched epitaxial layers that exceed the limits of equilibrium thermodynamics will degrade under sufficient thermal processing by converting the as-grown coherent epitaxy into a network of strain-relieving dislocations. After presenting the effects of strain on band structure, the authors describe the stability criterion for rapid-thermal processing of strained-layer structures and the effects of exceeding the thermodynamic limits. Finally, device results are reviewed for structures that benefit from high temperature processing of strained-layer superlattices.

24051 (UCRL-JC–105732) **Second and third order nonlinear optical properties of crystalline inorganic/organic complexes.** Marcy, H.O. (Rockwell International Corp., Thousand Oaks, CA (United States). Science Center); Warren, L.F.; Davis, L.E.; Webb, M.S.; Velsko, S.P. Lawrence Livermore National Lab., CA (United States). Jul 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9105418–1: 1991 Spring Materials Research Society (MRS) meeting, Baltimore, MD (United States), May 1991). Order Number DE93011883. Source: OSTI; NTIS; GPO Dep.

Properties for members of a new class of nonlinear optical (NLO) materials which stoichiometrically incorporate organic and inorganic constituents into a single crystalline lattice are reported. Recent results for our synthetic, crystal growth, and optical studies suggest that a number of these relatively transparent "semiorganic" compounds have significant second and/or third order NLO responses and often display favorable crystal growth morphologies. The prototype material of this class zinc tris(thiourea) sulfate, or ZTS, has a UV cutoff at about 325 nm, can be readily grown to cm^3 sizes, and has been shown to be a highly efficient Type II frequency doubler for 1064 nm Nd:Yag laser radiation. ZTS also processes a moderate third order nonlinear optical response (ca. $0.1 \times CS_2$) which occurs on at least a picosecond time scale as determined by degenerate four-wave mixing (DFWM) experiments at 532 nm. Refractive index, second harmonic generation, and DFWM data for a number of these new compounds are presented.

24052 (UCRL-JC–110245) **Automated net shaped molding of continuous fiber composites.** Spellman, G. (Lawrence Livermore National Lab., CA (United States)); Dodson, J.D.; Dittmer, W.D. Lawrence Livermore National Lab., CA (United States); Sparta, Inc., San Diego, CA (United States). Apr 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9204112–3: 2. small satellite technology and applications, Orlando, FL (United States), 20-24 Apr 1992). Order Number DE93012484. Source: OSTI; NTIS; GPO Dep.

Composite materials have demonstrated performance benefits for a variety of satellite applications. Now, an emphasis on smaller, more specialized satellites produced in higher quantities than before is emerging. Due to the competitive economic environment, realization of cost reduction potential by the use of composite materials is critical. Producibility techniques, long employed by other aerospace segments, offer an approach to cost reduction while retaining improved performance. One cost reduction approach is to reduce the number of piece parts and assembly operations by converting from a metal-based design to one based on composite technology. Alternate composite fabrication approaches can then be compared for thermoplastic and thermoset matrices for additional producibility benefits based on properties and comparative costs. Previously developed representative data are presented for this transition from a metallic component to composite and for alternate fabrication approaches. The next step in cost reduction would appear to be the introduction of automation techniques and

minimizing post fabrication operations while maintaining performance properties. The program described in section 3 is structured to provide a key confirming experiment to demonstrate that such a goal can be realized.

24053 (UCRL-JC–110334) **Damping measurements for ultra-high carbon steel/brass laminates.** Bonner, B.P. (Lawrence Livermore National Lab., CA (United States)); Lesuer, D.R.; Syn, C.K.; Brown, A.E.; Sherby, O.D. Lawrence Livermore National Lab., CA (United States). 26 Oct 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9211117–6: Minerals, Metals, and Materials Society/American Society for Metals (TMS/ASM) materials week '92, Chicago, IL (United States), 2-5 Nov 1992). Order Number DE93011886. Source: OSTI; NTIS; GPO Dep.

Damping measurements were made at high and low frequencies to investigate laminated metal composites (LMCs) ultrahigh carbon steel and brass for use in applications that require high damping capacity while maintaining strength and toughness. Properties of such laminates can be tailored through the selection of the component materials, volume percentage of the materials, layer thickness, interface strength and microstructural control. Damping was measured in the ultrasonic range (2.25 MHz) with pulse-echo torsional oscillator from 2 to 40 Hz in shear strain range 10^{-7} to 10^{-6}. Results at low frequencies indicate that Q_s^{-1} is 2 to 3 times higher than that of the highest damping component (brass). Damping is also independent of the layer orientation. Ultrasonic attenuation is much larger than for the component materials, with insertion losses ~100 dB/m greater than either component. Microstructure (metallography, SEM) and correlations between laminate structure and damping behavior are discussed.

24054 (UCRL-JC–111396) **Zerodur polishing process for high surface quality and high efficiency.** Tesar, A.; Fuchs, B. Lawrence Livermore National Lab., CA (United States). Aug 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9211104–8: OPTCON '92: optical fabrication and testing workshop, Boston, MA (United States), 17 Nov 1992). Order Number DE93012596. Source: OSTI; NTIS; INIS; GPO Dep.

Zerodur is a glass-ceramic composite importance in applications where temperature instabilities influence optical and mechanical performance, such as in earthbound and spaceborne telescope mirror substrates. Polished Zerodur surfaces of high quality have been required for laser gyro mirrors. Polished surface quality of substrates affects performance of high reflection coatings. Thus, the interest in improving Zerodur polished surface quality has become more general. Beyond eliminating subsurface damage, high quality surfaces are produced by reducing the amount of hydrated material redeposited on the surface during polishing. With the proper control of polishing parameters, such surfaces exhibit roughnesses of <lÅ rms. Zerodur polishing was studied to recommend a high surface quality polishing process which could be easily adapted to standard planetary continuous polishing machines and spindles. This summary contains information on a polishing process developed at LLNL which reproducibly provides high quality polished Zerodur surfaces at very high polishing efficiencies.

24055 (UCRL-JC–111969) **The optical constants and spectral specular reflectivity of highly oriented pyrolytic graphite (HOPG).** Havstad, M.A.; Schildbach, M.A.; McLean, W. II. Lawrence Livermore National Lab., CA (United States). Oct 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930830–11: National conference and exposition on heat transfer, Atlanta, GA (United States), 8-11 Aug 1993). Order Number DE93011894. Source: OSTI; NTIS; GPO Dep.

The measurements were made using two independent optical systems, with good agreement. The spectral directional-hemispherical reflectivity at normal incidence varies from 0.41 at 0.55 μm to 0.74 at 8.45 μm. Components of complex index of refraction increase smoothly with wavelength, the index increasing from 3.10 at 0.55 μm to 7.84 at 8.45 μm. Extinction coefficient varies from 2.01 to 6.66 over the same range. An attempt was made to fit the complex index to a model with both free and bound carriers. (DLC)

24056 (UCRL-JC–112312) **Investigation of optically generated electronic defects and protonic transport in hydrogen-bonded molecular solids: Isomorphs of potassium dihydrogen phosphate.** Davis, J.E. (California Univ., Davis, CA (United States). Dept. of Applied Science); Hughes, R.S. Jr.; Lee, H.W.H. Lawrence Livermore National Lab., CA (United States). Oct 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930586–5: Quantum electronics and laser science conference, Baltimore, MD (United States), 2-7 May 1993). Order Number DE93012498. Source: OSTI; NTIS; GPO Dep.

We present a coherent picture of a new class of defects that appear to affect hydrogen-bonded molecular solids represented in this study by isomorphs of KDP (DKDP, KDP, ADP). We also discuss the effects this defect has on two photon absorption measurements and the harmonic generation of UV pulses.

24057 (WSRC-MS–93-135) **Evaluation of seismic spatial interaction effects through an impact testing program.** Thomas, B.D.; Driesen, G.E. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930702–13: Pressure vessel and piping conference, Denver, CO (United States), 25-29 Jul 1993). Order Number DE93010376. Source: OSTI; NTIS; GPO Dep.

The consequences of non-seismically qualified objects falling and striking essential, seismically qualified objects is an analytically difficult problem to assess. Analytical solutions to impact problems are conservative and only available for simple situations. In a nuclear facility, the numerous "sources" and "targets" requiring evaluation often have complex geometric configurations, which makes calculations and computer modeling difficult. Few industry or regulatory rules are available for this specialized assessment. A drop test program was recently conducted to "calibrate" the judgment of seismic qualification engineers who perform interaction evaluations and to further develop seismic interaction criteria. Impact tests on varying combinations of sources and targets were performed by dropping the sources from various heights onto targets that were connected to instruments. This paper summarizes the scope, test configurations, and some results of the drop test program. Force and acceleration time history data and general observations are presented on the ruggedness of various targets when subjected to impacts from different types of sources.

24058 (CONF-920791–, pp. 6, Paper 7) **On-site infrared analyses for complex systems.** Jones, R.W. (Ames Lab., IA (US)); Ochiai, S.; McClelland, J.F. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

Infrared spectroscopy has long been a powerful analysis tool in the laboratory. Only recently, however. has it moved from the lab into the field or onto the industrial process line. Conventional spectroscopic methods often involve equipment (e.g., delicate long-pathlength cells) or sample-preparation methods (e.g.. grinding and dilution) that are difficult to use out side the laboratory. This project we uses two unconventional techniques requiring no delicate equipment and little or no sample preparation to bring the capabilities of infrared spectroscopy out of the laboratory or to materials

that are difficult to handle. The techniques are photoacoustic spectroscopy (PAS) and transient infrared spectroscopy (TIRS). The authors use PAS to acquire infrared spectra of volatile organic compounds (VOCs) in air, water, and soil samples in the field, so that the VOCs may be identified and their concentrations measured. PAS is also being used in the laboratory to examine radioactive materials because it requires very little sample handling and minimal sample volume. TIRS is an on-line technique for acquiring the infrared spectra of solids and viscous liquids. It is being developed as a real-time monitor for the polyethylene encapsulation of radioactive wastes that is being developed at Brookhaven National Laboratory and being tested at Rocky Flats Plant. These three applications of PAS and TIRS are discussed in detail.

24059 (CONF-920791–, pp. 9, Paper 9) **Progress in the development of indwelling probes for chlorinated organic solvents.** Daley, P.F. (Lawrence Livermore National Lab., CA (US)); Colston, B.; Brown, S.; Milanovich, F. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

A fiber optic sensor technology for the remote detection of trichloroethlyene (TCE) and chloroform has been developed. In laboratory studies, sensitivity below the EPA drinking water compliance level has been demonstrated for both TCE and chloroform. The efficacy of this technology for remediation activities is currently being evaluated at the Savannah River Integrated Demonstration project. Instrumentation for TCE detection has been developed and field tests of the TCE sensor in vadose zone and groundwater monitoring wells have been successfully conducted. A penetrometer implant of the TCE sensor was performed in late May, 1992. The technology has been transferred to industry by means of a field-of-use license. The licensee, Purus Corp., San Jose, CA will implement the sensor in above-ground remediation equipment. A license for vadose zone and groundwater applications is currently in negotiation. The technology will be transferred to SRS during FY 93.

24060 (CONF-920791–, pp. 7, Paper 10) **Characterization and monitoring of total organic chloride vapors.** Anheier, N.C. Jr. (Pacific Northwest Lab., Richland, WA (US)); Evans, J.C. Jr.; Olsen, K.B. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

Between the extremes represented by highly selective methods on the other (i.e., PID) lies an intermediate case of great interest for use at a large number of sites where the contamination setting is narrowly defined. A number of emerging chemical sensor development efforts have taken that approach. Such sensors find broad applicability in situations where the contamination issue or contamination potential is reasonably unambiguous. For example, if early warning is required for potential leaking of an underground storage tank containing gasoline, the sensor used should respond to a range of indicator species present in gasoline such as the BTEX fraction. A similar situation occurs during remediation of a well-characterized site such as is the case at the Savannah River M Area where trichloroethylene (TCE) and tetrachloroethylene (PCE) are clearly established as the dominant ground water and vadose zone contaminants requiring remediation, or the Hanford 200 West Area site where carbon tetrachloride (CCl_4) is well established as dominant. In those cases, a detector capable of monitoring total organic chlorinated compounds (TOCl) in real time and over a wide dynamic range is clearly beneficial. PNL is currently evaluating such a system for applicability to characterization and monitoring at the Savannah River Integrated Technology Demonstration Project and the Hanford VOC-Arid Integrated Technology Demonstration. The system is capable of measuring TOC1 in real time on an extracted gas sample over a wide linear dynamic range. The baseline technology used for comparison is an electrochemical sensor packaged as a field portable TOCl detection system. An optical-emission based TOCL sensor (Halosnif) developed by PNL appears to offer some distinct advantages over electrochemical sensors and other relevant baseline technologies.

24061 (CONF-920791–, pp. 6, Paper 14) **Contaminant analysis automation.** Erkkila, T.H. (Los Alamos National Lab., NM (US)); Hollen, R.M.; Beugelsdijk, T.J. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

The Department of Energy (DOE) has significant amounts of radioactive and hazardous wastes stored, buried, and still being generated at many sites within the United States. These wastes must be characterized to determine the elemental, isotopic, and compound content before remediation can begin. The authors project that sampling requirements will necessitate generating more than 10 million samples by 1995, which will far exceed the capabilities of current manual chemical analysis laboratories. The Contaminant Analysis Automation effort (CAA), with Los Alamos National Laboratory (LANL) as the coordinating Laboratory, is designing and fabricating robotic systems that will standardize and automate both the hardware and the software of the most common environmental chemical methods. This will be accomplished by designing and producing several unique analysis systems called Standard Analysis Methods (SAM). Each SAM will automate a specific chemical method, including sample preparation, the analytical analysis, and the data interpretation, by using a building block known as the Standard Laboratory Module (SLM). This concept allows the chemist to assemble an automated environmental method using standardized SLMs easily and without the worry of hardware compatibility or the necessity of generating complicated control programs.

24062 (CONF-920791–, pp. 7, Paper 34) **Direct analysis of involatile contaminants using molecular beam surface analysis (In situ SIMS analysis).** Groenewold, G.S. (EG & G Idaho, Inc., Idaho Falls (US)); Appelhans, A.D.; Ingram, J.C.; Delmore, J.E. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

A new program was initiated in March, 1992, at the Idaho National Engineering Laboratory (INEL) to develop rapid and sensitive analyses of surfaces for involatile contaminants, such as complexing agents and their metal complexes especially radioisotopes. Advances in primary beam technology and target surface neutralization have made it possible to analyze certain contaminants on surfaces such as leaves, building materials, and rocks, without the need for sample preparation. It is the objective of the first year of the program to assess the efficacy of molecular beam surface analysis for the direct detection of contaminants on these insulating surfaces.

24063 (DOE/ER/13357–22) **Interfacial chemistry in solvent extraction systems: Progress report, June 1, 1992–May 31, 1993.** Neuman, R.D. Auburn Univ., AL (United States). Dept. of Chemical Engineering. Jan 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-85ER13357. Order Number DE93015526. Source: OSTI; NTIS; GPO Dep.

Research this past year continued to emphasize characterization of the physicochemical nature of the microscopic interfaces, i.e., reversed micelles and other association microstructures, which form in both practical and simplified acidic organophosphorus extraction systems associated with Ni, Co, and Na in order to improve on the model for aggregation of metal-extractant complexes.

Also, the macroscopic interfacial behavior of model extractant (surfactant) molecules was further investigated. 1 fig.

24064 (DOE/ER/14187–1) **[Linear and nonlinear spectroscopic probing of solute interactions with chemically modified silica surface]: Progress report.** Delaware Univ., Newark, DE (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER14187. Order Number DE93014648. Source: OSTI; NTIS; GPO Dep.

Objective is to understand the surface science underlying liquid chromatographic separations, enabling improvements in design of chromatographic stationary phases. Progress was made both in use of laser spectroscopy to probe chromatographic surfaces and in developing new stationary phases based on self-assembled monolayers.

24065 (DOE/ER/75582–T1) **[Surface science instrumentation for the study of important catalytic and electrochemical interfaces]: Annual technical report.** California Inst. of Tech., Pasadena, CA (United States). Dept. of Chemistry. [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-90ER75582. Order Number DE93015068. Source: OSTI; NTIS; GPO Dep.

The equipment combines several standard surface science probes (uv photoelectron spectra, thermal desorption, AES) with a state-of-the art x-ray photoelectron spectrometer and integrates with a dry box and a custom electrochemical cell. After the LEED chamber was remachined, the instrument has been performing satisfactorily. Various studies using the instrument were conducted in cooperation with other groups. Si surfaces were studied before and after use as a photoanode in a photoelectrochemical cell.

24066 (DOE/ID/12691–T5) **On-line chemical composition analyzer development: Status report, February 1, 1993–April 30, 1993.** Garrison, A.A. Tennessee Univ., Knoxville, TN (United States). Measurement and Control Engineering Center. [1993]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC02-88ID12691. Order Number DE93014838. Source: OSTI; NTIS; GPO Dep.

This report relates to the development of an on-line Raman analyzer for control of a distillation column. It is divided into: program issues, experimental control system evaluation, energy savings analysis, and reliability analysis. (DLC)

24067 (DOE/METC/C–93/7065) **On-line, multielement ICP spectrometer for application to high temperature and pressure fossil fuel process streams.** Romanosky, R.R.; Viscomi, A.S.; Miller, S.S.; Chisholm, W.P. USDOE Morgantown Energy Technology Center, WV (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). (CONF-930304–18: 205. American Chemical Society national meeting, Denver, CO (United States), 28 Mar - 2 apr 1993). Order Number DE93011587. Source: OSTI; NTIS; GPO Dep.

METC is developing a real-time, multielement ICP spectrometer system for application to high temperature and high pressure fossil fuel process streams. The ICP torch operates on a mixture of argon and helium with a conventional annular swirl flow plasma gas, no auxiliary gas, and a conventional sample stream injection through the base of the plasma flame. The base of the torch body is a unique design, allowing process gas at 650°C to be injected into the torch. The RF generator (40.68 MHz) can deliver 10 kW, but the best detection limits have been observed at 5 kW. The detection system is a quartz fiber optic bundle mated to a battery of one-tenth meter monochromators with photomultiplier tubes. A microcomputer controls scanning of the monochromators and data acquisition from the PMTs. The METC ICP system is modular and mobile, allowing the system to be operated in close proximity to any process of interest. Previous work by other researchers [1] focused on monitoring of liquid phase process streams and looked only at elements at a relatively high concentration. Process monitoring by ICP spectrometry under conditions relevant to METC's advanced technologies has not been previously reported. The principle reason for this lack of progress is the difficulty of sustaining a stable plasma discharge around a high flow of carbon-containing sample gas.

24068 (DOE/PC/92521–T33) **Production of carbon molecular sieves from Illinois coal: Technical report, December 1, 1992–February 28, 1993.** Lizzio, A.A. (Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). Geological Survey); Rostam-Abadi, M.; Banerjee, D.D. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). 1993. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-92PC92521. Order Number DE93013653. Source: OSTI; NTIS; GPO Dep.

Carbon molecular sieves (CMS) have become an increasingly important class of adsorbents for use in gas separation and recovery processes. The overall objective of this project is to determine whether Illinois Basin coals are suitable feedstocks for the production of CMS and to evaluate the potential application of these products in commercial gas separation processes. In Phase 1 of this project, gram quantities of char were prepared from Illinois coal in a fixed-bed reactor under a wide range of pyrolysis and activation conditions. Chars having surface areas of 1500–2100 M^2/g were produced by chemical activation using potassium hydroxide (KOH) as the activant. These high surface area chars had more than twice the adsorption capacity of commercial molecular sieves. The kinetics of adsorption of various gases, e.g., N_2, O_2, CO_2, CH_4, CO and H_2, on these chars at 25°C was determined. Several chars showed good potential for efficient O_2/N_2, CO_2/CH_4, CO_2/H_2 and CH_4/H_2 separation; both a high adsorption capacity and selectivity were achieved. The full potential of these materials in commercial gas separations has yet to be realized. In Phase 2 of this project, currently in progress, larger quantities of char are being prepared from Illinois coal in a batch fluidized-bed reactor (FBR) and in a continuous rotary tube kiln (RTK). The pore structure of the prepared chars will be tailored for a specific gas separation process by activation in CO_2 and H_2O and/or carbon deposition with CH_4.

24069 (DOE-RAS–92.009) **Development of natural matrix reference materials for monitoring environmental radioactivity.** Holmes, A.S. (Laboratory of the Government Chemist (United Kingdom)); Houlgate, P.R.; Pang, S.; Brookman, B. Department of the Environment, London (United Kingdom). Radioactive Substances Div. 1992. [77p.] Contract PECD-7/9/447;ES1/RC/15/14/01. Order Number DE93624271. Source: OSTI; NTIS (US Sales Only); INIS.

The Department of the Environment commissioned the Laboratory of the Government Chemist to carry out a contract on natural matrix reference materials. A survey of current availability of such materials in the western world, along with the UK's need, was conducted. Four suitable matrices were identified for production and validation. Due to a number of unforeseen problems with the collection, processing and validation of the materials, the production of the four identified reference materials was not completed in the allocated period of time. In the future production of natural matrix reference materials the time required, the cost and the problems encountered should not be underestimated. Certified natural matrix reference materials are a vital part of traceability in analytical science and without them there is no absolute method of checking the validity of measurement in the field of radiochemical analysis. (author).

24070 (EGG-WTD–10507) **In situ secondary ion mass spectrometry analysis: 1992 Summary report.** Groenewold, G.S.; Applehans, A.D.; Ingram, J.C.; Delmore, J.E.; Dahl, D.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jan 1993. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93012185. Source: OSTI; NTIS; GPO Dep.

The direct detection of tributyl phosphate (TBP) on rocks using molecular beam surface analysis [MBSA or in situ secondary ion mass spectrometry (SIMS)] is demonstrated. Quantities as low as 250 ng were detected on basalt and sandstone with little or no sample preparation. Detection of TBP on soil has proven to be more problematic and requires further study. Ethylenediaminetetraacetic acid (EDTA) is more difficult to detect because it is very reactive with surfaces of interest. Nevertheless, it is possible to detect EDTA if the acidity of the surface is controlled. The detection of EDTA-metal complexes is currently an open question, but evidence is presented for the detection of ions arising from a

EDTA-lead complex. Carboxylic acids (i.e., citric, ascorbic, malic, succinic, malonic, and oxalic) give characteristic SIM spectra, but their detection on sample surfaces awaits evaluation.

24071 (IAEA-TECDOC–683) **Development and evaluation of alternative radioanalytical methods, including mass spectrometry for marine materials: Proceedings of an advisory group meeting held in Monaco, 6-9 June 1989.** International Atomic Energy Agency, Vienna (Austria). Jan 1993. [95p.] (CONF-8906428–: Advisory group meeting on development and evaluation of alternative radioanalytical methods, including mass spectrometry for marine materials, Monaco (Monaco), 6-9 Jun 1989). Order Number DE93625117. Source: OSTI; NTIS (US Sales Only); INIS.

One, if not the most important, aspect of environmental protection against radioactive contamination is the ability to measure accurately low-levels of radionuclides present in the environment. This is particularly true of the marine environment where improved and more rapid methods of analysis are required to identify the source and radiological impact of anthropogenic inputs to the oceans. More sensitive and rapid analytical methods with smaller analytical errors are required to study the behaviour of different radionuclides in the marine environment. Some of these radionuclides serve as useful research tracers that aid in understanding many complex oceanographic processes. With the ever-increasing demand for more accurate data, the IAEA considered it necessary to convene an Advisory Group Meeting to identify those long-lived radionuclides that may be measured by alternative techniques and discuss and evaluate the sensitivity of the analytical methods. The meeting was held at the IAEA Marine Environment Laboratory in Monaco from 6 to 9 June 1989 and was attended by 6 invited participants and several observers. This report from the meeting is divided into two parts. The first contains 5 contributing chapters. In these chapters the authors have endeavored to explain the principles of each measurement technique, the strengths and weakness of the method as applied to marine sciences, comparative costs and sensitivities, future developments and topics of interest to the Agency. The reviews and sensitivities were prepared exclusively by the participants on the basis of their own experience and knowledge of the existing literature. The second part of this report is the appendices section in which can be found tables of radionuclides considered in this report and a comparison of sensitivities for different methods of detection. Refs, figs and tabs.

24072 (IAEA-TECDOC–683, pp. 7-23) **Conventional radiometric methods of analysis including neutron activation.** Harvey, B.R. (Ministry of Agriculture, Fisheries and Food, Lowestoft (United Kingdom). Fisheries Radiobiological Lab.); Chazal, A. International Atomic Energy Agency, Vienna (Austria). Jan 1993. (CONF-8906428–: Advisory group meeting on development and evaluation of alternative radioanalytical methods, including mass spectrometry for marine materials, Monaco (Monaco), 6-9 Jun 1989). In *Development and evaluation of alternative radioanalytical methods, including mass spectrometry for marine materials: Proceedings of an advisory group meeting held in Monaco, 6-9 June 1989.* [95p.] Order Number DE93625117. Source: OSTI; NTIS (US Sales Only); INIS.

The chapter aims primarily to provide a reference with which the various mass spectrometric methods may be compared. The fundamental problems created by low specific activity in the measurement of very long-lived radionuclides using radiometric techniques are noted and discussed in terms of the different types of decay, background count rates, source weight and spectral interferences. An attempt is made to identify typical detection limits for the radiometric determination of the various long-lived radionuclides. The use of neutron activation as a means of enhancing sensitivity or convenience of measurement for long-lived radionuclides is described with appropriate illustrations. Mass spectrometry and radiometry are seen as complementary, not competitive techniques for the measurement of radioactive materials, each with its own advantages and disadvantages. (author). 21 refs, 2 figs, 6 tabs.

24073 (IAEA-TECDOC–683, pp. 25-35) **Accelerator mass spectrometry.** Mangini, A. (Heidelberger Akademie der Wissenschaften, Heidelberg (Germany)). International Atomic Energy Agency, Vienna (Austria). Jan 1993. (CONF-8906428–: Advisory group meeting on development and evaluation of alternative radioanalytical methods, including mass spectrometry for marine materials, Monaco (Monaco), 6-9 Jun 1989). In *Development and evaluation of alternative radioanalytical methods, including mass spectrometry for marine materials: Proceedings of an advisory group meeting held in Monaco, 6-9 June 1989.* [95p.] Order Number DE93625117. Source: OSTI; NTIS (US Sales Only); INIS.

The advances in Accelerator Mass Spectrometry (AMS) during the last 5 to 10 years enable the measurement of cosmogenic radionuclides such as ^{10}Be, ^{36}Cl, ^{26}Al, ^{14}C, ^{7}Be, and ^{32}Si, to a sensitivity exceeding the conventional detection methods via counting of radioactive decay. These new techniques enable the application of these nuclides to problems in the fields of marine geochemistry, geology and hydrology. (author). 18 refs, 3 figs, 2 tabs.

24074 (IAEA-TECDOC–683, pp. 45-51) **Thermal ionization mass spectrometry.** Buesseler, K.O. (Woods Hole Oceanographic Inst., Woods Hole, MA (United States)). International Atomic Energy Agency, Vienna (Austria). Jan 1993. (CONF-8906428–: Advisory group meeting on development and evaluation of alternative radioanalytical methods, including mass spectrometry for marine materials, Monaco (Monaco), 6-9 Jun 1989). In *Development and evaluation of alternative radioanalytical methods, including mass spectrometry for marine materials: Proceedings of an advisory group meeting held in Monaco, 6-9 June 1989.* [95p.] Order Number DE93625117. Source: OSTI; NTIS (US Sales Only); INIS.

Thermal ionization mass spectrometry (TIMS, or also known as surface ionization MS) refers to a technique for producing ions at the source of the mass spectrometer by evaporating a sample from a heated metal surface. This technique has been successfully employed for a large number of elements to measure precise isotopic ratios in a wide variety of environmental samples. By adding a known quality of an appropriate yield tracer to the sample, isotope dilution analyses can provide for concentration determinations down to the 10^{-15} to 10^{-18} gram range, using TIMS instruments. The background discussion on TIMS presented below, is intended to provide a brief overview of important considerations in TIMS techniques and instruments, and is based primarily upon the use of TIMS for the determination of long-lived actinides such as U, Th and Pu. (author). 42 refs.

24075 (IAEA-TECDOC–683, pp. 53-63) **Resonance ionization mass spectrometry.** Baxter, M.S. (International Atomic Energy Agency, Monaco (Monaco). Marine Environment Lab.). International Atomic Energy Agency, Vienna (Austria). Jan 1993. (CONF-8906428–: Advisory group meeting on development and evaluation of alternative radioanalytical methods, including mass spectrometry for marine materials, Monaco (Monaco), 6-9 Jun 1989). In *Development and evaluation of alternative radioanalytical methods, including mass spectrometry for marine materials: Proceedings of an advisory group meeting held in Monaco, 6-9 June 1989.* [95p.] Order Number DE93625117. Source: OSTI; NTIS (US Sales Only); INIS.

Of the various techniques outlined in this volume, that of resonance ionization mass spectrometry (RIMS) is until now the least developed yet it has perhaps the greatest potential for ultra-high-sensitivity nuclide-specific measurements. This statement applies generally and not only in the marine radioactivity context. There have thus far been no reported marine studies by RIMS on any of the radionuclides of interest listed in Appendix I - hence the absence of a RIMS entry in the summary tables. Yet the potential is considerable because, in RIMS, lasers effectively carry out a significant part of the chemistry which the other mass-spectrometric methods pre-require in stringent form; thus RIMS has added potential to reduce time, effort, isobaric and molecular interferences and hence to increase detection limits. (author). 27 refs, 4 figs.

24076 (IAEA-TECDOC–690, pp. 304-308) **Quantitative analysis of trace amounts of impurities contaminating pure graphite with ICP-MS and metal atomizer FLAAS.** Miyatani, T. (Toyo Tanso Co., Ltd, Mitoyo, Kagawa (Japan)); Suzuki, H.; Yoshimoto, O. International Atomic Energy Agency, Vienna (Austria). Feb 1993. (CONF-9109266–: International Atomic Energy Agency (IAEA) specialists meeting on status of graphite development for gas-cooled reactors, Tokai (Japan), 9-12 Sep 1991). In *The status of graphite development for gas cooled reactors: Proceedings of a specialists'*

meeting held in Tokai, Japan, 9-12 September 1991. [311p.] Order Number DE93625195. Source: OSTI; NTIS (US Sales Only); INIS.

Graphite has excellent properties for the moderator or reflector of the high temperature gas-cooled reactor. In semi-conductor engineering, graphite is also available widely. For these applications the determination of the extremely low impurity level for graphite is one of the most important problems. Using an inductive coupled plasma mass spectrometer, the impurity level of elements Li, B, Na, Mg, Al, Ti, V, Cr, Fe, Mn, Ni, Co, and Zn were analyzed. Using a metal atomizer-flameless atomic absorption spectrophotometer the impurity level of K, Ca and Cu were analyzed. The highly purified graphite (IG-110) manufactured by Toyo Tanso was used for the sample. It was found that the quantitative analysis of a trace amount of impurities in graphite with high sensitivity is possible with these analyzing methods. (author). 11 figs, 1 tab.

24077 (IEN-DQUI-DIAPQ–001/86) **Spectrophotometric determination of beryllium.** Dutra, P.B. Instituto de Engenharia Nuclear (IEN), Rio de Janeiro, RJ (Brazil). Div. de Quimica. 1986. [7p.] (In Portuguese). Order Number DE93624294. Source: OSTI; NTIS (US Sales Only); INIS.

The studies of beryllium analysis in ores or in its industrial compounds are presented, including its purification, extraction with mesityl oxide and spectrophotometry. (C.G.C.).

24078 (IEN-DQUI-DISIS–001/86) **Potentiometric titration of uranium reduced by chromic salts in chloridic solutions.** Coutinho, C.M.C.; Bastos, E.T.R. Instituto de Engenharia Nuclear (IEN), Rio de Janeiro, RJ (Brazil). Div. de Quimica. Jun 1986. [4p.] (In Portuguese). Order Number DE93624295. Source: OSTI; NTIS (US Sales Only); INIS.

The utilization of chromic salts for reducing the uranium (VI) from chloridic solutions, for potentiometric dosage is described. This method is used in the range of 0,002 to 1,0 M of uranium. (C.G.C.).

24079 (IEN-DQUI-DISIS–002/86) **Uranium determination by spectrophotometry, in chloride solutions, using titanium (III) as reducer.** Bastos, E.T.R.; Bastos, M.B.R. Instituto de Engenharia Nuclear (IEN), Rio de Janeiro, RJ (Brazil). Div. de Quimica. Aug 1986. [6p.] (In Portuguese). Order Number DE93624296. Source: OSTI; NTIS (US Sales Only); INIS.

A simple method for determining uranium in uranium (VI) solutions with the presence of uranium (IV), iron (II), and titanium (IV) in chloridic solution is described. The method comprises in uranium (VI) reduction with titanium (III), acidity adjustment and uranium (IV) spectrophotometry in hydrochloric acid 2 M. (C.G.C.).

24080 (JINR-E–14-91-398) **Fine-powder Al_2O_3 and SiO_2 for preparation of multielement standards for rare-earth elements analysis.** Nazarov, V.M.; Chinaeva, V.P.; Frontasyeva, M.V.; Parry, S.; Bennet, B.A.; Chen Sen Pal; Li Chel Zu. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1991. [8p.] Order Number DE93625118. Source: OSTI; NTIS (US Sales Only); INIS.

The present paper based on the experimental results contains the discussions and suggestions on the possible use of the fine-powder Al_2O_3 and SiO_2 as multielement standards for neutron activation analysis with original content of microimpurities up to 40 elements. 3 refs.; 1 fig.; 3 tabs.

24081 (LA–12436-MS-Vol.1) **Quality assurance for environmental chemistry, 1991: Volume 1.** Gautier, M.A.; Gladney, E.S.; Jones, E.A.; Koski, N.L.; O'Malley, B.T.; Brooks, G.H.; Moss, W.D. Los Alamos National Lab., NM (United States). Dec 1992. 149p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93011791. Source: OSTI; NTIS; GPO Dep.

This report documents the continuing quality assurance efforts of the Environmental Chemistry Group (EM-9) at the Los Alamos National Laboratory. The philosophy, methodology, computing resources, and laboratory Information management system used by the quality assurance program to encompass the diversity of analytical chemistry practiced in the group are described. Included in the report are all quality assurance reference materials used, along with their certified or consensus concentrations, and all analytical chemistry quality assurance measurements made by EM-9 during 1991.

24082 (LA–12436-MS-Vol.2) **Quality assurance for environmental chemistry, 1991: Volume 2.** Gautier, M.A.; Gladney, E.S.; Jones, E.A.; Koski, N.L.; O'Malley, B.T.; Brooks, G.H.; Moss, W.D. Los Alamos National Lab., NM (United States). Dec 1992. 473p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93011792. Source: OSTI; NTIS; GPO Dep.

This report documents the continuing quality assurance efforts of the Environmental Chemistry Group (EM-9) at the Los Alamos National Laboratory. The philosophy, methodology, computing resources, and laboratory Information management system used by the quality assurance program to encompass the diversity of analytical chemistry practiced in the group are described. Included in the report are all quality assurance reference materials used, along with their certified or consensus concentrations, and all analytical chemistry quality. assurance measurements made by EM-9 during 1991. This volume contain figures and tables related to analytical results and the computer software QA CHECK.

24083 (LA-SUB–93-171) **Synthesis of organic ligands for f-element separations: Final report.** Paine, R.T. (New Mexico Univ., Albuquerque, NM (United States). Dept. of Chemistry). Los Alamos National Lab., NM (United States); New Mexico Univ., Albuquerque, NM (United States). Dept. of Chemistry. [1993]. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93012915. Source: OSTI; NTIS; GPO Dep.

The efficacy of CMP and CMPO (carbamoylmethylphosphonates, carbamoylmethylphosphine oxides) as extractants has stimulated interest in design of new extractants, in particular, bifunctional and trifunctional ligands containing both P=O and N-O donors. 2,6-bis(diphenylphosphino)pyridine N,P,P-trioxide was selected as a target, with the bifunctional and trifunctional diphenylmethylphosphino analogs as alternate target ligands. The ligands were synthesized and characterized. Their coordination chemistry was studied using Pr, Tb, Yb, Th; a wider range of metal/ligand stoichiometries was found than typically found for other ligands, and the ligands are sufficiently basic that, under some conditions, they displace nitrate ion from the inner coordination sphere, which is unusual for neutral donor ligands. For both 2:1 and 4:1 complexes, the ligand is bonded to the Ln(III) ions in a bidentate manner, and in a tridentate manner for 1:1 and 2:1 complexes. These ligands may be unusually effective solvent extraction agents, and liquid-liquid extraction studies are in progress. (DLC)

24084 (LBL–33753) **The effect of crystal tilt on high resolution micrographs of small metal particles.** Malm, J.O. (Lund Univ. (Sweden). Dept. of Inorganic Chemistry 2); O'Keefe, M.A. Lawrence Berkeley Lab., CA (United States). Jan 1993. 2p. Sponsored by USDOE, Washington, DC (United States); Swedish National Science Research Council (Sweden). DOE Contract AC03-76SF00098. Grant K-KU 6332-303. (CONF-9306164–1: Conference on electron microscopy, Lund (Sweden), 9-11 Jun 1993). Order Number DE93013915. Source: OSTI; NTIS; GPO Dep.

The structure of small (1.5-5 nm) metal particles has been studied by high resolution transmission electron microscopy. For particles of this size, it is not possible to use tilting techniques (selected area diffraction), which means that the microscopist has to rely on the image when deciding in which direction the particle is viewed. This work points out some of the problems of intuitive determination of the viewing direction. (DLC)

24085 (ORNL/FTR–4205) **[Travel to Australia for meetings on materials science and electron microscopy]: Foreign trip report, February 5–22, 1992.** Bentley, J. Oak Ridge National Lab., TN (United States). 9 Mar 1992. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93010574. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Invited papers were presented at the Australian Conference on Electron Microscopy (ACEM-12) and at two workshops on analytical electron microscopy. Invited seminars were presented at

ANSTO, Lucas Heights Research Laboratories, and CSIRO, Division of Materials Science and Technology. The conference, workshops, and laboratory visits afforded a comprehensive overview of Australian electron microscopy research and applications to materials science.

24086 Programmable spectral imaging method and apparatus. Buican, T.N.; Yoshida, T.M. To Dept. of Energy. 1991. Filed date 30 Apr 1991. USA patent application 7-693,466. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93012012. Source: OSTI; NTIS; GPO Dep.

This invention is comprised of an integrated fluorescence analysis system that enables a component part of a sample to be virtually sorted within a sample volume after a spectrum of the component part has been identified from a fluorescence spectrum of the entire sample in. a flow cytometer. Birefringent optics enables the entire spectrum to be resolved into a set of numbers representing the intensity of spectral components of the spectrum. One or more spectral components are selected to program a scanning laser microscope, preferably a confocal microscope, whereby the spectrum from individual pixels or voxels in the sample can be compared. Individual pixels or voxels containing the selected spectral components are identified and an image may be formed to show the morphology of the sample with respect to only those components having the selected spectral components. There is no need for any physical sorting of the sample components to obtain the morphological information.

24087 (SAND–93-0813C) **Crystallographic phase identification in the scanning electron microscope: Backscattered electron Kikuchi patterns.** Michael, J.R.; Goehner, R.P. Sandia National Labs., Albuquerque, NM (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930822–2: Annual meeting of the Electron Microscopy Society of America, Cincinnati, OH (United States), 1-6 Aug 1993). Order Number DE93011574. Source: OSTI; NTIS; INIS; GPO Dep.

Use of charge coupled device-based detector for acquisition of high-quality backscattered electron Kikuchi patterns (BEKP) allows on-line crystallographic phase identification in the SEM. Phase identification through combined BEKP and energy dispersive x-ray spectrometry is demonstrated using Ru oxide thin films on Si, which were identified as tetragonal RuO_2. (DLC)

24088 (SLAC–415) **Proceedings of the workshop on applications of synchrotron radiation to trace impurity analysis for advanced silicon processing.** Laderman, S. (Integrated Circuits Business Div., Hewlett Packard Co., Palo Alto, CA (United States)); Pianetta, P. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Mar 1993. 159p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (SLAC/SSRL–0009;CONF-9210277–: Workshop on the applications of synchrotron radiation to trace impurity analysis of advanced silicon processing, Stanford, CA (United States), 21 Oct 1992). Order Number DE93013389. Source: OSTI; NTIS; GPO Dep.

Wafer surface trace impurity analysis is essential for development of competitive Si circuit technologies. Today's grazing incidence x-ray fluorescence techniques with rotating anodes fall short of requirements for the future. Hewlett Packard/Toshiba experiments indicate that with second generation synchrotron sources such as SSRL, the techniques can be extended sufficiently to meet important needs of the leading edge Si circuit industry through nearly all of the 1990's. This workshop was held to identify people interested in use of synchrotron radiation-based methods and to document needs and concerns for further development. Viewgraphs are included for the following presentations: microcontamination needs in silicon technology (M. Liehr), analytical methods for wafer surface contamination (A. Schimazaki), trace impurity analysis of liquid drops using synchrotron radiation (D. Wherry), TRXRF using synchrotron sources (S. Laderman), potential role of synchrotron radiation TRXRF in Si process R&D (M. Scott), potenital development of synchrotron radiation facilities (S. Brennan), and identification of goals, needs and concerns (M. Garner).

Ltd., Tokyo (Japan)); Curtiss, L.A.; Gosztola, D.; Koura, N.; Loong, C.K.; Saboungi, M.L. Argonne National Lab., IL (United States). Materials Science Div. Apr 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930571–11: 183. Electrochemical Society meeting, Honolulu, HI (United States), 16-21 May 1993). Order Number DE93012941. Source: OSTI; NTIS; GPO Dep.

The Raman and neutron scattering spectra of 46 mol% $AlCl_3$ -54 mol% 1-ethyl-3-methyl imidazolium chloride (EMIC) and 67 mol% $AlCl_3$ - 33 mol% EMIC melts are presented. Ab initio molecular orbital calculations have been carried out on structures of chloroaluminate anion and EMI cation and the interaction between anion and cation.

24090 (BNL–48645) **Symmetry lowering in crystalline solid solutions: A study of cinnamamide-thienylacrylamide by x-ray and neutron diffraction and solid-state photochemistry.** Shimon, L.J.W. (Brookhaven National Lab., Upton, NY (United States)); Weissinger-Lewin, Y.; McMullan, R.K.; Vaida, M.; Frolow, F.; Lahav, M.; Leiserowitz, L. Brookhaven National Lab., Upton, NY (United States). [1993]. 48p. Sponsored by USDOE, Washington, DC (United States); United States-Israel Binational Science Foundation, Jerusalem (Israel). DOE Contract AC02-76CH00016. (CONF-9304113–1: Faraday Division of Royal Society of Chemistry conference on crystal growth, Glasgow (United Kingdom), 14-16 Apr 1993). Order Number DE93010871. Source: OSTI; NTIS; GPO Dep.

Principles are outlined for symmetry lowering of a mixed crystal. A survey is given of methods used to detect reduced symmetry: changes in crystal morphology, detection of enantiomeric segregation of chiral additives in "centrosymmetric" crystals, generation of second harmonic optical signals, optical birefringence, asymmetric photoreactions in the crystalline state and X-ray and neutron diffraction. The last two methods are applied to mixed crystals of cinnamamide host and thienylacrylamide. Diffraction demonstrated that the mixed crystals are composed of six sectors of reduced symmetry, from monoclinic centrosymmetric $P2_1/c$ to triclinic P1 in four sectors and possibly Pc in the remaining two. The X-ray diffraction data were not sufficiently accurate for assigning the absolute structures of the PI sectors of anomalous X-ray scattering. Thus, by this method one could not ascertain the absolute orientation of the guest molecules on the surface sites through which they were selectively occluded. This ambiguity was resolved by assignment of the absolute configuration of the chiral heterophotodimers, between host and guest, in enantiomeric excess in the PI sectors, after irradiation with UV light. This leads to the conclusion that the selective occlusion of thienylacrylamide arises from replacement of attractive C-Hπ (electron) interactions between host molecules by a repulsive sulfur (lone pair electron)π(electron) interactions between guest and host at the crystal surfaces.

24091 (CEA-CONF–11282) **Thermal stability of morpholine, AMP and sarcosine in PWR secondary systems. Laboratory and loop experiments.** Feron, D.; Lambert, I. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Service de la Corrosion, d'Electrochimie et Chimie des Fluides. 1991. [21p.] (CONF-9108114–: 2. international symposium on chemistry in high temperature water, Provo, UT (United States), 19-22 Aug 1991). Order Number DE93626262. Source: OSTI; NTIS (US Sales Only); INIS.

Laboratory and loop tests have been carried out in order to investigate the thermal stability of three amines (morpholine, AMP and sarcosine) in PWR secondary conditions. Laboratory experiments have been performed in a titanium autoclave at 300 deg C. The results pointed out high thermal decomposition rates of AMP and sarcosine. A decomposition mechanism is proposed for the 3 amines. Loop tests have been performed in order to compare

steam cycle conditioning with ammonia, morpholine and AMP. The amine concentrations and the decomposition products such as acetate and formate have been followed around the secondary circuit of the ORION loop which reproduces the main physico-chemical characteristics of a PWR secondary circuit. These concentrations are reported together with the evolution of cationic conductivities. The influence of oxygen concentration on amine thermal stability has been observed. Results are expressed also in terms of decomposition rates and of relative volatility.

24092 (CONF-921275–, pp. 7-10) **Application of the environmental temperature oscillation method to a continuous tank type reactor. 2.: Monitoring the reaction run-away starting temperature using transient response measurement.** Nagai, T. (Yokohama National University, Yokohama (Japan)); Ishihara, a.; Asakura, S. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Discussions were given on a method to predict reaction runaway risks in a heat generating chemical reaction process. A critical temperature at which a system loses stability can be derived from the stability index μ. Stability is indicated by $\mu>0$, a critical condition by $\mu=0$,and instability by $\mu<0$. The index μ is derived by measuring temperature response Δ Ts in a system against an oscillation Δ Te in the environmental temperature, while measuring Δ Ts requires a long time before the system reaches a new steady state. Accordingly, a method to use transient response was proposed in this paper. Using a reaction heat balance in a continuous tank type reactor against the time functions Δ Te (t) and Δ Ts (t), a linear locus was obtained on the time constants (taw) and μ. By giving an oscillation of an adequate time function Δ Te (t) to a system in steady condition, and measuring Δ Ts (t) in the system, (taw) and μ can be derived quickly from the obtained locus. By plotting several (Ts, μ)s from an experiment, extrapolating them, and finding a cross section with a curve for $\mu=0$, the critical temperature can be provided. The method was applied to a methanol reaction using Fenton's reagent, where a good prediction value was obtained. 1 ref., 7 figs., 1 tab.

24093 (CONF-921275–, pp. 29-30) **Considerations on thermal stability evaluation. 4.** Fujita, A. (Mitsubishi Kasei Corp., Tokyo (Japan)); Akiba, K.; Iizuda, Y. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Using data from tests of a laboratory scale as basic data for a process design presents a problem in reliability of the test data. This paper discusses reliability of an isothermal retention test using an accelerating rate calorimeter (ARC) known as a heat insulation testing equipment. The test sample used was dicyclohexyl phthalate (DCP) containing BPO at 22.5% by weight and DCP at 77.5% by weight. The sample was determined of heat generation at 0.02°C /min when retained isothermally at 55°C. Because maintaining the test accuracy requires a calibrating operation on thermocouples, the first and eighth measurements were compared after calibration. As a result of investigating other effects of sample amount, it was believed that using the ARC isothermal retention data simply to predict time-based changes in a practical facility scale would present problems which require discussions according to specificities of reaction systems. 5 figs.

24094 (CONF-921275–, pp. 31-32) **Considerations on thermal stability evaluation. 5.: Evaluation on thermal decomposability of azobenzene using DSC.** Iizuka, Y. (Mitsubishi Kasei Corp., Tokyo (Japan)); Fujita, A.; Akiba, K. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

The studies on thermal decomposition behavior of azobenzene in a sealed container as having been reported in the previous reports estimated that relation between sample amount and DSC heat generation and the heat absorbing phenomenon immediately before a heat generating phenomenon are attributed to thermal characteristics of azo compounds. The present paper describes a detailed investigation on the heat generating and absorbing phenomena during an SC-DSC test in which the sample filling rate (test sample amount divided by DSC container capacity) was varied. Silver-made sealed DSC sample containers with two types of capacities were used: 15μL and 70μL. The sample temperature was raised in a velocity range from 1 to 10 °C/min. As a result, the DSC thermogram showed a large difference in the heat absorbing and generating amounts even with the same amount of samples. That is, the thermal behavior of azobenzene was affected by the sample filling rate rather than from the sample amount. A thermal decomposition reaction of trans-body vapor is the major reaction in a low filling region. In a high filling region, the liquid phase governs the reaction, where the reaction transfers to isomerization of trans-bodies to cis-bodies, and to thermal decomposition of the cis-bodies. 1 ref., 3 figs., 1 tab.

24095 (DOE/ER/14065–T1) **Phase equilibria and volumetric properties for the System NaCl-$CaCl_2$-H_2O.** Oakes, C.S. Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States). [1993]. 119p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-89ER14065 ;AC05-84OR21400. Order Number DE93013590. Source: OSTI; NTIS; GPO Dep.

Low temperature phase relations in the ice-stable field of the system NaCl-$CaCl_2$-H_2O were determined under 1 atm. total pressure along the NaCl-H_2O and $CaCl_2$-H_2O binaries and along five pseudobinaries with constant NaCl/(NaCl+$CaCl_2$) weight ratios. The results are in excellent agreement with published data along the NaCl-H_2O binary but show large discrepancies when compared to previous determinations of the ice liquidus alone, the $CaCl_2$-H_2O binary and in the NaCl-$CaCl_2$-H_2O ternary. At moderate to high salinities, isotherms cross the ice sub-field at lower total salt concentrations than previously reported. In addition, NaCl(NaCl+$CaCl_2$) weight ratios estimated from hydrohalite- and ice-melting temperatures may be low by as much as 15%. Relative densities were measured for NaCl(aq) and $CaCl_2$(aq) solutions to 250°C and 400 bars and over the range of ionic strengths 0.2–5.5 and 0.2–19.2 mol·kg^{-1}, respectively. The results span the pressure and temperature of earlier volumetric studies and extend to higher molalities than reported previously. The relative densities have been fitted as apparent molar volumes (V_ϕ) using the Pitzer ion-interaction treatment, with appropriate expressions chosen for the temperature- and pressure-dependence of the virial coefficients of the model. The results presented for NaCl(aq) are in good agreement with published results to 250°C. The results presented for $CaCl_2$(aq) are in good agreement with published values to approximately 125°C.

24096 (DOE/ER/14280–1) **Catalytic arene hydrogenation using early transition metal hydride compounds: Progress report.** Rothwell, I.P. Purdue Univ., Lafayette, IN (United States). 15 Mar 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER14280. Order Number DE93015500. Source: OSTI; NTIS; GPO Dep.

Progress was achieved in four areas: development of surface supported Group 5 metal organometallic compounds for catalytic arene hydrogenation, isolation and reactivity of possible intermediates in catalytic arene hydrogenation, synthesis and characterization of new d^0-metal hydride compounds, and stoichiometric reactivity of d^0 metal hydrido, aryloxide compounds. (DLC)

24097 (DOE/ER/14281–1) **Anchoring strategies for bimetallic species in zeolites: Progress report.** Bein, T. Purdue Univ., Lafayette, IN (United States). Dept. of Chemistry. Mar 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER14281. Order Number DE93015622. Source: OSTI; NTIS; GPO Dep.

We explore a new approach by introducing heterobinuclear organometallic compounds for linking catalytic functions to zeolite frameworks. With two different metals present, the complexes are being anchored to the support via one oxophilic metal, ligand exchange and catalytic reactions may proceed at the second metal center. Anchoring chemistry, thermal stability and reactivity of $Me_3SnMn(CO)_5$ in zeolite NaY and acid forms of zeolite Y was studied with X-ray absorption spectroscopy (Sn, Mn edge EXAFS) and in-situ FTIR/TPD-MS techniques. Subsequently, the tin-cobalt complex $Me_3SnCo(CO)_4$ has been a focus of detailed synthetic

and spectroscopic studies. The reactivity of tricarbonyl (cyclopentadienyl) (trimethylstannyl) molybdenum in new mesoporous hosts has been explored. A recent development is the design of vanadium oxo species in different micro- and mesoporous hosts. These are of great interest for the selective reduction of nitrogen oxides by ammonia, and selective oxidation of different hydrocarbons, such as xylenes, olefines and alkanes. Combination analytical techniques used to probe local structural changes at the molecular level, include EXAFS (Extended X-Ray Absorption Fine Structure) spectroscopy utilizing synchrotron radiation, in situ FT-IR coupled to thermodesorption/MS, UV-NIR, and CCD Raman.

24098 (DOE/ER/14289–1) **An investigation of molybdenum and molybdenum oxide catalyzed hydrocarbon formation reactions: Progress report, August 1, 1992–April 1, 1993.** Wisconsin Univ., Milwaukee, WI (United States). 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER14289. Order Number DE93015932. Source: OSTI; NTIS; GPO Dep.

Progress was made in the following four areas: activity of model catalyst (Mo oxides) for olefin metathesis (2 $C_3H_6 \rightarrow C_4H_8 + C_2H_4$); kinetics of Mo(100)-catalyzed olefin metathesis; surface chemistry of ethylene oxide on Pd(111); and uv source construction.

24099 (DOE/ER/14301–1) **Photoinduced charge separation in linked donor-chromophore-acceptor systems: Progress report, September 1, 1993–May 31, 1993.** Elliott, C.M. Colorado State Univ., Fort Collins, CO (United States). Jun 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER14301. Order Number DE93015070. Source: OSTI; NTIS; GPO Dep.

Focus has been mainly on preparation and characterization of triply bridged dinuclear complexes containing a tris-2-2'-bipyridineruthenium chromophore and a second tris-bipyridine metal complex which is to serve as electron donor or acceptor, and of linked RuL_3-containing D-C-A complexes where D is a phenothiazine donor and A is a diquat type acceptor. (DLC)

24100 (DOE/PC/89784–T2) **Binding and catalytic reduction of NO by transition metal aluminosilicates: Final technical progress report, September 1989–August 1992.** Klier, K.; Herman, R.G.; Hou, S. Lehigh Univ., Bethlehem, PA (United States). Feb 1993. 109p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-89PC89784. Order Number DE93014856. Source: OSTI; NTIS; GPO Dep.

Catalysts prepared and analyzed include cobalt(II) exchanged A zeolites having 1.3, 1.77, 2.6, and 3.9 Co(II) ions per unit cell. They have been analyzed by high resolution X-ray photoelectron spectroscopy (HR-XPS) and optical diffuse reflectance spectroscopy before and after dehydration and after adsorption and desorption of NO. The ion exchange process can be quantitatively monitored by HR-XPS analysis. The reactor system, with a quadrupole mass spectrometer for gas analysis, allows in situ optical spectroscopy by diffuse reflectance to be carried out to determine the oxidation state and symmetry of the transition metal ions prior to and after interaction with NO and with N_2O. Both static and dynamic temperature programmed reaction and desorption (TPD) experiment were carried out. Adsorption experiments confirmed accessibility of trigonally held transition metal cations and that NO adsorption is strong and reversible. A doubly exchanged Co/Ce A zeolite was prepared, characterized, and tested for NO decomposition. This catalyst was especially active for NO decomposition, but segregation of the Ce component tended to occur. The Ce-containing zeolites tended to form N_2O in larger amount than N_2 under the TPD conditions that were utilized. An understanding of the electronic structure and bonding scheme in the zeolite-held complexes was provided by semi-empirical extended Hueckel calculations. Ligand field stabilization energies were calculated for the first row transition series monovalent and divalent metals, as were the reducibilities. The transition metal cations on the right side of the periodic table should form strong complexes with NO. Valence band spectra, as well as HMO calculations, indicate that there is significant bonding overlap of 3d orbitals of Co ions with the zeolite O 2p-based lattice orbitals.

24101 (DOE/PC/90035–T2) **Synthesis of 6-Methyl-9-propyldibenzothiophene-4-ol: Technical progress report No. 2, October 25, 1990–January 25, 1991.** Eisenbraun, E.J. Oklahoma State Univ., Stillwater, OK (United States). Dept. of Chemistry. 15 Feb 1991. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90035. Order Number DE93015779. Source: OSTI; NTIS; GPO Dep.

The synthesis route for preparing the title compound, has been carried out on a small scale for the preparation of a mixture of isomers. Alternative routes for the cyclization are being explored. (DLC)

24102 (DOE/PC/90035–T6) **Synthesis of 6-Methyl-9-n-propyldibenzothiophene-4-ol ammended to 6-Methyl-9-(1-methylethyl)-dibenzothiophene-4-ol: Quarterly technical progress report No. 6, October 28, 1991–January 26, 1992.** Oklahoma State Univ., Stillwater, OK (United States). 28 Feb 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90035. Order Number DE93015775. Source: OSTI; NTIS; GPO Dep.

The material presented below is taken from Status Reports 15, 16 and 17 and covers the progress made toward the synthesis of the modified target molecules 9-isopropyl-4-methoxy-6 methyldibenzothiophene (13) and 9-isopropyl-6methyldibenzothiophene-4-ol (14).

24103 (DOE/PC/91306–6) **Sorption and chemical transformation of PAHs on coal fly ash: Technical progress report No. 6.** Mamantov, G.; Wehry, E.L. Tennessee Univ., Knoxville, TN (United States). Dept. of Chemistry. [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91306. Order Number DE93014974. Source: OSTI; NTIS; GPO Dep.

The objective of this work is to characterize the interactions of coal fly ash with polycyclic aromatic hydrocarbons (PAHs) and their derivatives, and to understand the influence of the surface properties of coal ash (and other atmospheric particles) on the chemical transformations of polycyclic aromatic compounds. Specific investigations directed toward this overall objective include: (a) Fractionation of heterogeneous coal fly ash samples into different particle types varying in size and chemical composition (carbonaceous, mineralmagnetic, and mineral nonmagnetic); (b) Measurement of the rates of chemical transformation of PAHs and PAH derivatives (especially nitro-PAHs) and the manner in which the rates of such processes are influenced by the chemical and physical properties of coal fly ash particles; (c) Chromatographic and spectroscopic studies of the nature of the interactions of coal fly ash particles with PAHs and PAH derivatives; (d) Characterization of the fractal nature of fly ash particles (via surface area measurements) and the relationships of "surface roughness" of fly ash particles to the chemical behavior of PAHs sorbed on coal ash particles. PAHs are deposited, under controlled laboratory conditions, onto coal ash surfaces from the vapor phase, in order to mimic the processes by which PAHs are deposited onto particulate matter in the atmosphere.

24104 (DOE/PC/92118–T1) **Bench-scale demonstration of biological production of ethanol from coal synthesis gas: Quarterly report, September 24, 1992–December 31, 1992.** Engineering Resources, Inc., Fayetteville, AR (United States). 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92118. Order Number DE93015055. Source: OSTI; NTIS; GPO Dep.

Culture isolation and selection studies are being performed in order to select the best biological system for bench-scale studies in producing ethanol from syngas components. Three isolates have been found which produce more than 2 g/L ethanol from CO and $C0_2/H_2$ in batch culture. These low concentrations are actually quite promising since Clostridium ljungdahlii, strain PETC, performs well in continuous culture but produces only small concentrations of ethanol in batch culture after several weeks of incubation. Two of the isolates have been utilized in the CSTR, where 90 percent CO conversions have been noted, while producing up to 2 g/L ethanol, in preliminary studies. CSTR studies will continue until steady state is reached. An anaerobic bacterium has been isolated from natural sources that converts the components of synthesis

gas (CO, H_2,$C0_2$) into ethanol. This organism, the only one known at that time to produce ethanol from synthesis gas, has been identified as a new clostridial strain and has been named Clostridium ljungdahlii, strain PETC.

24105 (DOE/PC/92521–T29) **Protocols for the selective cleavage of carbon-sulfur bonds in coal: Technical report, December 1, 1992–February 28, 1993.** Bausch, M. (Southern Illinois Univ., Carbondale, IL (United States)); Ho, K.K. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). [1993]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-92PC92521. Order Number DE93013648. Source: OSTI; NTIS; GPO Dep.

Chemical reactions that result in carbon-sulfur bond cleavage are an essential aspect of any protocol designed to remove organic sulfur from coal. Planned in the second year of our project Protocols for the Selective Cleavage of Carbon-Sulfur Bonds in Coal are investigations of reactions in which organic sulfur-containing coal model compounds are subjected to different conditions of temperature, solvent mixtures and radiation. Other investigations that will result in analyses of the likelihood of C-S bond cleavages resulting from various oxidative processes will also be undertaken. Summarized in this quarterly report are results of our investigations of the following topics: (a) desulfurization of coal model sulfones; (b) desulfurization of coal model sulfides; (c) photooxidation of organic sulfides; and (d) photolytic desulfurization of coal.

24106 (DOE/PC/92532–T3) **Fischer-Tropsch synthesis in supercritical reaction media: Progress report, January 1, 1993–March 31, 1993.** Subramaniam, B.; Bochniak, D.; Snavely, K. Kansas Univ., Lawrence, KS (United States). Dept. of Chemical and Petroleum Engineering. Apr 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92532. Order Number DE93014963. Source: OSTI; NTIS; GPO Dep.

The reactor configuration has been modified to handle tows both in the upflow and downflow directions. For comparison to bubble column operation, an upflow mode of operation will be used. For comparison to trickle-bed operation, a downflow mode will be employed. Thus, this modification allows the most flexibility for studying the effects of liquid and supercritical reaction media on the Fischer-Tropsch synthesis reaction and permits comparisons of our experimental results with previous work. A stainless steel reactor tube was ordered. This unit along with three other pieces of tubing (greater than 1/4in. i. d.) are to be sent to Alon Processing Co. for alonizing (passivating) the internal surface. This process had been employed by Huff and Satterfield (1983) to ensure that the stainless steel surfaces are catalytically inert at high temperatures (> 200°C).

24107 (INIS-CL–004) **Kinetic and thermodynamic study of lithium ternary amalgams in contact with solvated lithium hydroxide.** Cordova M, M. Chile Univ., Santiago (Chile). Facultad de Ciencias. Dec 1991. [130p.] (In Spanish). Order Number DE93625290. Source: OSTI; NTIS (US Sales Only); INIS.

Lithium amalgams are used on lithium isotope separation, the process has been studied in its different parameters, but there is no information on the isotopic separation in the presence of ternary metals diluted in the amalgam. The latest voltammetric technique developed for trace analysis is used for the study, to determine the effects of the presence of cadmium, which has been selected on compatibility criteria with the system, in the intermetallic structures of the amalgam. The differential pulse anodic stripping voltammetry indicates the presence of an intermetallic persistent structure after the potassium and lithium oxidation. This structure has a slow formation and destruction rate, with an anionic character, which accounts for the oxidation potential displacement of the amalgamated metals. The activation energy results of amalgam decomposition reaction in contact with water, allows to establish the intermetallic effects on this reaction, raising the energy of the activated state, on condition that there were time to form it. A reaction mechanism is proposed that agrees with these results. The study of the isotopic composition indicates that the intermetallic species affect the thermodynamic equilibrium between the phases in contact. The measurements of the system's isotopic composition do not give exact values for the separation factors, but they establish a difference in the sign of enthalpies of the isotopic equilibria. The enthalpy for the isotopic exchange for the binary amalgam is negative, with a value that agrees with those in the literature. Nevertheless, those of the ternary systems are positive, indicating an endothermic character process. (author).

24108 (JAERI-M–93-056) **Numerical kinetic model including equilibrium and rate equations for chemical reactions of actinide elements.** Ishiguro, Misako (Ibaraki Univ., Mito (Japan)); Tachimori, Shoichi; Naito, Shinjiro. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1993. 35p. (In Japanese). Order Number DE93797610. Source: OSTI; NTIS; INIS.

Numerical simulation method was examined for chemical reactions of actinide elements U, Pu, Np, and Tc etc. in an aqueous nitric acid solution. It is known that the numerical calculation for the Purex process with chemical reactions and liquid flow becomes stiff, because time constant for the chemical reactions is two to three order of magnitude smaller due to the very fast reactions than that of mass transfer or of reaching distribution equilibrium. Recently in order to increase a time step Δt the partial equilibrium (P.E.) model, in which some very fast reactions are treated by the equilibrium law whereas other reactions are by the rate law, has been proposed. In the present study concentration change of the solutes in an aqueous solution with 30 chemical reactions, of which 4 are expressed by equilibrium equations, has been calculated. Description of the P.E. model and the comparison of the results and cpu time between the kinetic and the P.E. models are given. (author).

24109 (KAPL–4735) **Magnetite stability in aqueous sodium phosphate solutions at elevated temperatures.** Ziemniak, S.E.; Opalka, E.P. Knolls Atomic Power Lab., Schenectady, NY (United States). Mar 1992. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC12-76SN00052. (CONF-930821–1: 9. international symposium on environmental degradation of materials in nuclear power systems, St. Louis, MO (United States), Aug 1993). Order Number DE92016359. Source: OSTI; NTIS; GPO Dep.

Magnetite (Fe_3O_4) is shown to transform to a sodium ferric hydroxy-phosphate compound in concentrated, alkaline sodium phosphate solutions at elevated temperatures via 1/3 Fe_3O_4(s) + 13/3 Na^+ + 2 $HPO_4^=$ $\rightleftarrows$ $Na_4Fe(OH)(PO_4)_2 \cdot 1/3NaOH$(s) + 1/3 H^+ + 1/6 H_2(g). The thermodynamic equilibrium for this reaction was defined in the system Na_2O-$P_2O_5$$Fe_3O_4$-$H_2O$ for Na/P molar ratios between 2.1 and 3. Quantitative chemical, infrared and Mossbauer spectroscopic, and X-ray diffraction analyses are employed to verify that the precipitated solid was a single phase having the non-whole number stoichiometric Na/P ratio 2.15 $\pm$ 0.02. Standard entropy and free energy of formation for sodium ferric hydroxyphosphate were calculated to be 729.2 J/mol-K and −3550.3 kJ/mol, respectively.

24110 (LBL–34031) **Tris(Cyclopentadienyl)Uranium-t-Butyl: Synthesis, reactions, and mechanisms.** Weydert, M. Lawrence Berkeley Lab., CA (United States). Apr 1993. 188p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93015036. Source: OSTI; NTIS; GPO Dep.

Compounds $(RC_5H_4)_3U(t\text{-}Bu)$ were prepared for R = H, Me, Et. Their decomposition products in aromatic solvents are consistent with a radical decomposition pathway induced by solvent-assisted U-C bond homolysis. NMR was used to study the reactions of $(RC_5H_4)_3UCl$ with t-BuLi (R = t-Bu, Me_3Si). Reactions of $(MeC_5H_4)_3U(t\text{-}Bu)$ with Lewis bases and fluorocarbons were studied. Analogous reaction chemistry between $(RC_5H_4)_3ThX$ systems and t-BuLi was also studied, and reactivity differences between U and Th are discussed. Synthesis of sterically crowded $(RC_5H_4)_4U$ compounds is next considered. Reaction of the trivalent $(RC_5H_4)_3U$ with $(RC_5H_4)_2Hg$ results in formation of $(RC_5H_4)_4U$. Steric congestion, cyclopentadienyl ligand exchange, and electron transfer are discussed. (DLC)

24111 (ORNL/FTR–4297) **Travel to Germany and France to present two talks at the international conference on interaction of iron based materials with water and steam: Foreign trip report, May 16, 1992–June 10, 1992.** Palmer, D.A. Oak Ridge National Lab., TN (United States). 22 Jun 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract

AC05-84OR21400. Order Number DE93011077. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler spent two weeks at the University of Witten/ Herdecke, Germany, conducting experiments in collaboration with R. van Eldik, professor of inorganic chemistry. These experiments involved measuring the spectrum of the transient iodine species, I_2OH^-, using a rapid-scan, diode-array spectrophotometer. Temperature-jump spectrophotometric measurements were made of the rate of attainment of the dimerization equilibrium involving di- and bichromate, as well as the rate of formation of CrO_3X^{n-}, where X represents 11 different ligands. The traveler and J. M. Simonson (Chemistry Division, ORNL) presented the results of their two year, EPRI sponsored investigation of the volatility of NH_4Cl to an international committee representing 11 countries in Mannheim. The traveler gave an oral presentation at the subsequent international conference in Heidelberg. This talk raised the possibility of future collaboration on the measurement of pH at high temperatures with research groups in Italy and the USA. Finally, a seminar was presented at the CNRS in Nancy, France, and discussions were held with Dr. C. Nguyen-Trung (CREGU, Nancy) concerning continued collaborative research in the field of uranium chemistry.

24112 (PNL-SA–21663) **Reverse micelle synthesis of nanoscale metal containing catalysts.** Darab, J.G.; Fulton, J.L.; Linehan, J.C. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930304–19: 205. American Chemical Society national meeting, Denver, CO (United States), 28 Mar - 2 apr 1993). Order Number DE93012869. Source: OSTI; NTIS; GPO Dep.

The need for morphological control during the synthesis of catalyst precursor powders is generally accepted to be important. In the liquefaction of coal, for example, iron-bearing catalyst precursor particles containing individual crystallites with diameters in the 1-100 nanometer range are believed to achieve good dispersion through out the coal-solvent slurry during liquefaction 2 runs and to undergo chemical transformations to catalytically active iron sulfide phases. The production of the nanoscale powders described here employs the confining spherical microdomains comprising the aqueous phase of a modified reverse micelle (MRM) microemulsion system as nanoscale reaction vessels in which polymerization, electrochemical reduction and precipitation of solvated salts can occur. The goal is to take advantage of the confining nature of micelles to kinetically hinder transformation processes which readily occur in bulk aqueous solution in order to control the morphology and phase of the resulting powder. We have prepared a variety of metal, alloy, and metal- and mixed metal-oxide nanoscale powders from appropriate MRM systems. Examples of nanoscale powders produced include Co, Mo-Co, Ni_3Fe, Ni, and various oxides and oxyhydroxides of iron. Here, we discuss the preparation and characterization of nickel metal (with a nickel oxide surface layer) and iron oxyhydroxide MRM nanoscale powders. We have used extended x-ray absorption fine structure (EXAFS) spectroscopy to study the chemical polymerization process in situ, x-ray diffraction (XRD), scanning and transmission electron microcroscopies (SEM and TEM), elemental analysis and structural modelling to characterize the nanoscale powders produced. The catalytic activity of these powders is currently being studied.

24113 (UCRL-JC–109948) **The importance of hard core repulsion in models of activity coefficients in aqueous electrolyte solutions: Illustration in the case of hydration theory.** Wolery, T.J.; Jackson, K.J. Lawrence Livermore National Lab., CA (United States). Jul 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920761–17: 7. water-rock interaction conference, Park City, UT (United States), 9-23 Jul 1992). Order Number DE93012476. Source: OSTI; NTIS; GPO Dep.

Activity coefficients in aqueous electrolyte solutions are primarily affected by two kinds of phenomena. The standard Debye-Huckel equation represents only one of these, the long range electrical interactions. Of nearly equal importance is hard core (HC) repulsion, which is not electrical in nature. To a first-order approximation, HC repulsive effects are independent of the ionic strength, depending instead on the sum of the solute molalities (Σm). Adding a term for HC repulsion to the standard Debye-Huckel model produces what we call a hybrid two-term model In a previous work (Wolery and Jackson 1990) we proposed a new method for making hydration corrections to the standard Debye-Huckel model. In the present work, we examine the effect of extending this model to include hard core repulsion. Although the activity coefficients of 1:1 electrolytes can be fit quite well by the model without a HC term the inclusion of such a term is critical to success in fitting the data for 2:1 and other higher-order electrolytes.

24114 (UCRL-JC–110049-Rev.1) **Polymeric nitrogen: Revision 1.** Mailhiot, C.; Yang, L.H.; McMahan, A.K. Lawrence Livermore National Lab., CA (United States). Aug 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9204235–2-Rev.1: 1992 Air Force high energy density materials contractors meeting, Lancaster, CA (United States), 12-14 Apr 1992). Order Number DE93012600. Source: OSTI; NTIS; GPO Dep.

Ab initio local-density functional total-energy calculations indicate that a polymeric form should be the stable phase of nitrogen above $\sim$ 35 GPa, and that such a polyermic phase is likely to be both energetic and metastable at atmospheric pressure. These results also suggest that such a polymeric form of nitrogen may survive metastably at atompsheric pressure as an energetic, high-melting temperature, insulating solid, with a specific enthalpy of 6.7–14.1 MJ/kg. While this does not exceed the Air Force HEDM goal of 15 MJ/kg, such a material may nevertheless compare favorably with existing monopropellants. 2 figs., 24 refs.

24115 (CONF-921276–, pp. 239-242) **Degradation of environmental pollutants by solar energy. Part 3.: Visible light enhancement of the degradation of organophosphorous compounds by hydrogen peroxide in presence of iron salt.** Inoue, Y. (Tokai University, Tokyo (Japan)). 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference*. Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Decomposing environmental pollutants using solar energy was discussed. Aqueous solution of organophosphorous compounds was selected as the discussion object. When the solution is oxidized with hydrogen peroxide using iron salt as a catalyst, the reaction progressed rapidly. Irradiating a light on this reaction system accelerated the reaction, evidencing a presence of reaction species that absorb the light. An intermediate in which organophosphorous compounds and hydrogen peroxide are coordinated in iron ions is relatively stable, but exhibits strong oxidizing power when it absorbs a light and oxidizes surrounding ligands completely. Hydrogen peroxide works upon where O=P, an excellent σ donor, is coordinated in the iron ions, and coordinates in the iron in the form of water. The material discharges hydrogen ions at this time, turning into a chemical species A, and further turning into ferryl, a high-order iron oxide (chemical species B) discharging hydroxide ions. The chemical species B has a strong oxidizing power when it absorbs a light. (It makes some oxidizing action even under shielded light.) This decomposition system is effective for treating highly concentrated organophosphorous waste liquid. 11 figs.

Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-85ER13439. Order Number DE93015078. Source: OSTI; NTIS; GPO Dep.

During the last year, three projects were completed: a high resolution spectroscopic study of CH stretch of HCCN, measurement of rate constant of reaction between ethynyl (CCH) and H_2 at 295–875 K, and measurement of recombination rate of propargyl (CH_2CCH) at room temperature. (DLC)

24117 (DOE/ER/14024–4) **Dynamics of charge-transfer excited states relevant to photochemical energy conversion: Technical report, June 1, 1992–March 30, 1993.** Lim, E.C. Akron Univ., OH (United States). Dept. of Chemistry. 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER14024. Order Number DE93013981. Source: OSTI; NTIS; GPO Dep.

A systematic study of intramolecular photoassociation and photoinduced charge transfer (CT) was initiated in bichromophoric systems of M-X-M, where two identical aromatic hydrocarbons M are joined by X=CH_2, O, NH, etc. Dinaphthylamines, dinaphthylethers, and dinaphthylmethanes in nonpolar solvents form triplet excimers, following inter system crossing of singlets to the triplet manifold; in polar solvents, the molecule forms an intramolecular CT state. The interchromophore interaction study was extended to N-phenyl-2-naphthylamine. The lowest excited singlet states of the dinaphthylamines were studied by semiempirical quantum chemical methods. Exciplex formation was studied in excited states of jet-cooled van der Waals complexes, such as fluorene/substituted benzenes and 1-cyanonaphthalene-aliphatic amines.

24118 (DOE/ER/14156–2) **Photodissociation and spectroscopy of gas phase bimetallic clusters: Annual progress report.** Duncan, M.A. Georgia Univ., Athens, GA (United States). Research Foundation. May 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-90ER14156. Order Number DE93015559. Source: OSTI; NTIS; GPO Dep.

Focus of the research program is the study of gas phase metal clusters for modeling fundamental interactions on metal surfaces. We characterize the chemical bonding between component atoms in clusters as well as the bonding in adsorption on cluster surfaces. Electronic spectra, vibrational frequencies and bond dissociation energies are measured for both neutral and ionized clusters with laser/mass spectrometry techniques. Small bimetallic cluster cations containing Bi/Cr, Bi/Fe, Sn/Bi, and Pb/Sb were photodissociated at various uv wavelengths. Silver dimer van der Waals complexes were produced with a series of rare gas atoms (Ar, Kr, Xe), and their vibrational frequencies and dissociation energies were obtained. (DLC)

24121 (JAERI-M–93-052) **Statistical thermodynamic properties of uranium hexafluoride.** Oda, Tetsuzo (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1993. 55p. Order Number DE93797608. Source: OSTI; NTIS; INIS.

Statistical thermodynamic properties of uranium hexafluoride (UF_6) for extended temperature range are investigated using simulation techniques. As useful information 200 vibrational states are specifically tabulated, where these are shown in the order of population at a temperature of 300 K. Simulations of UF_6 ν_3 band contour were made in order to investigate the isotopic selectivity. These revealed that the real spectrum should be quasi-continuous feature heavily overlapped by a number of hot bands, while the selectivity should slightly depend on the absorption frequency. The present study would provide useful information for designing of the 'Infrared Uranium Enrichment Monitoring System' for safeguards on a gas centrifuge type uranium enrichment plant, and for other fundamental analyses of infrared spectra. (author).

24122 (RCM–01192) **Effects of humic substances on the migration of radionuclides: Complexation of actinides with humic substances. Second progress report.** Kim, J.I.; Rhee, D.S.; Wimmer, H.; Buckau, G.; Klenze, R.; Decambox, P.; Moulin, C.; Moulin, V.; Tits, J.; Marquardt, C.; Herrmann, G.; Trautmann, N.; Dierckx, A.; Vancluysen, J.; Maes, A. Technische Univ. Muenchen, Garching (Germany). Inst. fuer Radiochemie. Sep 1992. 90p. Contract CEC FI2W-CT91-0083. Order Number DE93795289. Source: OSTI; NTIS (US Sales Only); INIS.

The aim of the present research programme is to study the complexation behaviour of actinide ions with humic substances in natural aquifer systems and hence to quantify the effect of humic substances on the actinide migration. Aquatic humic substances commonly found in all groundwaters in different concentrations have a strong tendency towards complexation with actinide ions. This is one of the major geochemical reactions but hitherto least quantified. Therefore, the effect of humic substances on the actinide migration is poorly understood. In the present research programme the complexation of actinide ions with humic substances will be described thermodynamically. This description will be based on a model being as simple as possible to allow an easy introduction of the resulting constants into geochemical modelling of the actinide migration. (orig.).

24123 (RCM–01192, pp. 1-20) **Complexation of trivalent metal ions (Am^{3+},Cm^{3+}) with humic acid: A comparison of different experimental methods.** Kim, J.I. (Technische Univ. Muenchen, Garching (Germany). Inst. fuer Radiochemie); Rhee, D.S.; Wimmer, H.; Buckau, G.; Klenze, R. Technische Univ. Muenchen, Garching (Germany). Inst. fuer Radiochemie. Sep 1992. Contract CEC FI2W-CT91-0083. In *Effects of humic substances on the migration of radionuclides: Complexation of actinides with humic substances. Second progress report.* 90p. Order Number DE93795289. Source: OSTI; NTIS (US Sales Only); INIS.

The complexation of trivalent metal ions with humic acid has been studied at pH4 and 5 in 0.1 M $NaClO_4$ by three different experimental methods, i.e. UV spectroscopy, time resolved laser fluorescence spectroscopy (TRLFS) and ultrafiltration. The direct speciation of the metal ion and its humate complex in the reaction process has been made by UV spectroscopy for Am(III) in the micromolar concentration range and by TRLFS for Cm(III) in the nanomolar concentration range. The ultrafiltration is used with the lowest pore size of filter (ca. 1 nm) to separate the uncomplexed metal ion from its complexed species. The concentrations of both metal ion and humic acid are varied in such a manner that the effective functional groups of the humic acid becomes loaded with metal ions from 1% to nearly 100%. The loading capacity of the humic acid for the trivalent metal ion, determined separately at eacy pH, is introduced into the evaluation of complexation constants. The metal ion concentration varied from $6x10^{-8}$ mol/L to $4x10^{-5}$ mol/L does not show any concentration effect on the complexation reaction. The three different methods give rise to constants being comparable with one another. The average value

of the constants thus determined is logss = 6.24 ± 0.28 for the trivalent actinide ions. (orig.).

24124 (RCM–01192, pp. 90) **Complexation of lanthanides and actinides with humic acids.** Decambox, P. (Commissariat a l'Energie Atomique, 92 - Fontenay-aux-Roses (France). Dept. des Procedes de l'Enrichissement); Moulin, C.; Moulin, V.; Tits, J. Technische Univ. Muenchen, Garching (Germany). Inst. fuer Radiochemie. Sep 1992. Contract CEC FI2W-CT91-0083. In *Effects of humic substances on the migration of radionuclides: Complexation of actinides with humic substances. Second progress report.* 90p. Order Number DE93795289. Source: OSTI; NTIS (US Sales Only); INIS.

The interactions between humic substances and radioelements have been studied by using a spectroscopy method: Time-Resolved Laser-Induced Spectrofluorometry (TRLIS). In particular, this technique is used for lanthanides (Dy) and actinides (Cm). The TRLIS method consists of the measurement of the fluorescence signal increase of the studied cation when adding a complexing agent (humic substances). The analysis of such titration curves permits to obtain informations on the interaction constants and the complexing capacities of the humic materials towards the studied cation. (orig./BBR).

24125 (RCM–01192, pp. 1-10) **Further investigations of the humate complexation of very low concentrations of neptunium(V).** Marquardt, C. (Mainz Univ. (Germany). Inst. fuer Kernchemie); Herrmann, G.; Trautmann, N. Technische Univ. Muenchen, Garching (Germany). Inst. fuer Radiochemie. Sep 1992. Contract CEC FI2W-CT91-0083. In *Effects of humic substances on the migration of radionuclides: Complexation of actinides with humic substances. Second progress report.* 90p. Order Number DE93795289. Source: OSTI; NTIS (US Sales Only); INIS.

Further investigations were made by continuous electrophoretic ion focusing on the humate complexation of Np(V) in very low concentrations - about 10^{-13} M - at ionic strength 0.01 M, pH 5 and various humic acid concentrations. In addition an anion exchange chromatographic technique with DEAE-Sephadex A25 was applied to separate Np-humate from free Np(V). With both separation techniques the ratio Np_{bound}/Np_{free} was determined and from this an estimate of the interaction constant ss for humate complexation of Np(V) was made. A logss of 5.18 ± 0.08 was obtained by ion focusing and 5.26 ± 0.05 by anion exchange chromatography under the assumption of a humic acid loading capacity of 5%. Experiments of humate complexation of neptunium in presence of calcium have shown that calcium acts as a competing ion and diminishes the complexation of trace amounts of neptunium. (orig.).

24126 (RCM–01192, pp. 1-26) **Effects of humic substances on the migration of radionuclides: Complexation of actinides with humic substances in natural aquatic systems.** Dierckx, A. (Katholieke Univ. Leuven, Heverlee (Belgium). Lab. voor Colloidchemie); Vancluysen, J.; Maes, A. Technische Univ. Muenchen, Garching (Germany). Inst. fuer Radiochemie. Sep 1992. Contract CEC FI2W-CT91-0083. In *Effects of humic substances on the migration of radionuclides: Complexation of actinides with humic substances. Second progress report.* 90p. Order Number DE93795289. Source: OSTI; NTIS (US Sales Only); INIS.

This report covers the study of the interaction of Eu with Aldrich humic acid. The interaction constant will be defined as ss = EuL/(Eu*HA)[III] = M_b/M_f*HA[III] in which EuL and Eu are expressed in mol/l and HA[III] in tridentate sites/l of humic acid (HA). Two main aspects are dealt with: 1. The characterization of the HA ligand HA[III] in terms of its acid-base behaviour in neutral electrolyte solution, its interaction with trivalent cobaltihexammine (CoHM) and its complexation capacity for Eu. 2. Extension of the determination of the Eu interaction constant from low pH values (pH range 3 to 6) as described in the previous report (Dierckx et al, 1992) to higher pH values. (orig.).

24127 (CONF-921275–, pp. 11-14) **Hazard evaluation on peracetic acid manufacturing process.** Tanaka, N. (Sumitomo Chemical Co. Ltd., Osaka (Japan)); Kikuchi, T.; Hirabae, Y.; Ichimura, K. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Discussions were given on hazard and safety measures for equilibrium peracetic acid manufactured from acetic acid and hydrogen peroxide. The material is composed of acetic acid at 27%, peracetic acid at 30%, and others. It decomposes at low temperatures, has higher impact sensitivity than m-Dinitrobenzene, and propagates a detonation. It has as large power as 53% of TNT, and its decomposition is accelerated when an impurity is mixed. It may decompose abnormally when heated. If reacted until it reaches an equilibrium by adding hydrogen peroxide with a concentration of 60% into acetic acid, latent hazard increases at a point when half of the hydrogen peroxide has been added. Heat may be removed efficiently if a quantity to be handled is as small as 500 g or less without a problem even at 40°C, but a 4 , reaction run-away may occur in a quantity of about one ton if the temperature exceeds 26°C. An abnormal decomposition phenomenon is a gaseous phase explosion because of abrupt temperature rise in gaseous phase that is not seen in a normal decomposition. Required safety measures may include controlling impact, heat, concentration, temperature, oxygen concentration, and impurities, as well as emergency cooling and extracting facilities, and rapture disks. 2 refs., 2 figs., 4 tabs.

24128 (CONF-921275–, pp. 81-84) **Effects of inclination angles to perpendicular direction on PMMA flat plate imposed on burning behavior.** Ota, K. (Yokohama National Univ., Yokohama (Japan). Faculty of Engineering); Otani, H.; Uehara, Y. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

It is critical to know behavior of burning solids on a slanted plane in a room fire. Therefore, a discussion was given on effects of inclination angles on combustibility using PMMA flat plates as a combustible solid. The test samples are of square with a side from 30 mm to 100 mm and a thickness of 30 mm, with their bottoms and sides surrounded with 10-mm thick heat insulating boards. The experimental equipment has such a construction that a test specimen is placed on an L-shaped beam, supported on a point of support and a load cell, and can adjust the inclination angles in a range of ±90°. The test specimens were heated and ignited using a gas burner to record weight losses, temperatures at each part, and flame heights, and observed with a video camera. The results of the experiment revealed that the inclination angle dependence of combustion rates can be quantified using empirical laws of natural convection heat transfer, that is, the velocity of retrogression of the surface as a result of combustion can be expressed with a function of the inclination angle and the lengths of the specimen sides, and the combustion velocity can be presented by a primary function of the heat transfer coefficient in the whole inclination range. 6 refs., 7 figs.

24129 (CONF-921275–, pp. 89-92) **Numerical study on non-fire alarm due to cigarette smoke.** Sato, A. (Fire Research Institute, Tokyo (Japan)). 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Non-fire alarms issued from an automatic fire alarm due to cigarette smoke gives a large adverse effect to the fire alarm reliability, but there is a problem that the smoke signal is difficult to distinguish from smoking of an actual fire. Accordingly, with an objective of identifying its characteristics, an investigation was made

on flowing characteristics of a cigarette smoke around a smoke sensor using an experiment and a numerical calculation. As a result of measuring the smoke concentrations under various conditions using a photoelectric smoke sensor installed at the center of a ceiling, it was found that a non-fire alarm is caused from smoke with large particulate sizes blown out upward from a mouth of a person, and that smoke smoking naturally from a cigarette placed in an ash tray scatters and gets diluted before reaching the ceiling causing little possibility of a non-fire alarm. A numerical simulation clarified the flow velocities of air conditioning air-flows, the time-based change in the smoke movement and diffusion when the cigarette smoke blowing out directions were varied, and the appearance of smoke not reaching a sensor depending on the flows. 6 refs., 11 figs.

24130 (CONF-921275–, pp. 93-96) **Ignitin of silane-oxygen-nitrogen gas mixture.** Kondo, S. (National Chemical Laboratory, for Industry, Tsukuba (Japan)); Urano, Y.; Horiguchi, S.; Iwasaka, M.; Tokuhashi, K.; Nagai, H. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Silane, or that diluted with an inert gas, ignites spontaneously when it has flown out into air, but on the other hand has a high explosion lower limit in air allowing it to exist stably even with a concentration of 5% or higher. Accordingly, a discussion was given to elucidate this seemingly contradictory phenomenon. A mixing equipment using a cylindrical glass container performed an operation of gas discharge under normal temperature → introduction of 5.09% oxygen/nitrogen gas mixture and 10 % nitrogen → stirring → introduction of silane/nitrogen gas mixture. Occurrence of spontaneous ignition was observed visually. What has been verified in the mixing experiment at different proportions is as follows: With a silane-air-nitrogen mixture with the silane concentration of about 1% or lower, a possibility of spontaneous ignition exists only in a region with very little oxygen at an air concentration of less than 0.4%; and if white powder (with SiO2 as the main component) that has been once ignited is kept inadvertently deposited on the container, its catalytic action can cause a spontaneous ignition under normal temperature and pressure almost regardless of the mixture concentration. 2 refs., 3 figs.

24131 (CONF-921275–, pp. 97-100) **Explosion risks in silane.: Gas mixture with etching gas.** Horiguchi, S. (National Chemical Laboratory for Industry, Tsukuba (Japan)). 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Discussions were given on explosion risks in gas mixture of silane (SiH4) with such etching gases used in semiconductor manufacturing processes as SF6, CF4, BF3, and SF4. The explosion limits were measured using a pressure container (100 mm in diameter×100 mm in height, with stirring blades) by means of igniting the gas mixture fusing a nichrome wire at its center to determine occurrence of an explosion from temperature, pressure change and the state of residues in the container. The experiment was carried out all in room temperature and atmospheric pressure, and the gases were mixed using a partial pressure process. As a result, such findings were obtained as data for the explosion pressure ratios to the gas concentrations and the flame temperatures, and the residues. The result may be summarized as follows: The SF6/silane system had a high explosion risk with an explosion range from 10.1% to 89.9% by volume; the SF4 system also has a similar explosion risk; and the CF4 and BF3 systems have low explosion risks. 4 refs., 4 figs.

24132 (CONF-921275–, pp. 129-132) **Study on pyrolytic behavior of nitroanthraquinone.** Sakata, N. (Yokohama National University, Yokohama (Japan). Faculty of Engineering); Otani, H.; Uehara, Y. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

This paper describes a discussion on the behavior and mechanism of heat decomposition in several nitro compounds of anthraquinone used for manufacturing quinone-based dyes, from the viewpoint of dealing with their risks of heat generation. Experiments were carried out including thermal analyses using thermogravimetry and differential scanning calorimetry (with temperature raising rate of 10°C /min), and gas chromatographic analyses using temperature raising methods. Test specimens used were 1-nitroanthraguinone (1-NAQ), 1, 5-dinitroanthraguinone and 1, 8-dinitroanthraquinone. The result of findings may be summarized as follows: The above two dinitro compounds showed approximately the same results in pyrolytic temperatures, generation rates of decomposed gases, and pressure vessel tests, which suggest that their pyrolytic mechanisms do not differ much, but do the starting process of thermal decomposition; and nitro-group reduction took place in the 1-NAQ pyrolytic process as the decomposition temperature was raised. 2 refs., 5 figs., 3 tabs.

24133 (CONF-921275–, pp. 155-156) **Thermal explosion limit temperatures in liquids.** Kotoyori, T. (Research Institute of Industrial Safety, Tokyo (Japan)). 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

This paper proposes equations to derive thermal explosion limit temperatures in such liquids as liquid organic peroxides. The Semenov's conditional expression for thermal explosion limit (Semenov's expression) is an equation to express the ratio between heat generating rate and heat dissipating rate when a fluid hypothesized to have a uniform internal temperature distribution is placed in an ultimate condition to cause an explosion. The Semenov's equation displaces reaction-kinetic and thermal parameters and an 'S' liquid size into an observable physical amount and makes it a simple form. However, because physical amount relating to a container is not included, and the actually existing liquid is put in the container placed in the gravity field, the equation has to express the physical amount in actual values in 'hr' with respectively different collective coefficients 'h' for heat transfer. The product value of 'hr' and 'Sr' of a certain container can be derived from measurements, whereas the 'hrSr' term can be deleted. With this equation, a thermal explosion limit temperature of an actually existing liquid put in an optional container at an optional amount can be calculated based only on a physical amount that can be readily and accurately measured. Calculations of liquid organic peroxides were compared with measurements. 1 tab.

24134 (DOE/ER/13878–5) **[Homogeneous-hetergeneous combustion: Thermal and chemical coupling: Annual report].** Minnesota Univ., Minneapolis, MN (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER13878. Order Number DE93016050. Source: OSTI; NTIS; GPO Dep.

Fundamental studies of reactions at low pressures and of boundary layers give microscopic information on homogeneous-heterogeneous reactions. Ignition and extinction studies over simple geometries give basic bifurcation behavior with which to characterize multiple steady states and their stabilities and (hopefully) to identify the types of behavior which may occur. Oxidation of methane, propane, and ammonia were studied; other fuels will be studied. Catalytic monoliths will be used. Modeling will be performed.

24135 (LA–12503-MS) **KIVA-3: A KIVA program with block-structured mesh for complex geometries.** Amsden, A.A. Los Alamos National Lab., NM (United States). Mar 1993. 97p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93011986. Source: OSTI; NTIS; GPO Dep.

This report describes the KIVA-3 computer program for numerical calculation of transient, two- and three-dimensional chemically reactive fluid flows with sprays. KIVA-3 is an extension of the earlier KIVA-II, uses the same numerical solution procedure, and solves the same set of equations. The full generality of KIVA-II has been retained; thus KIVA-3 is applicable to laminar or turbulent flows, subsonic or supersonic flows, and single-phase or dispersed

two-phase flows. KIVA-3 differs from KIVA-11 in that it uses a block-structured mesh with connectivity defined through indirect addressing. The departure from a single rectangular structure in (i,j,k) logical space allows complex geometries to be modeled with significantly greater efficiency than was previously possible because large regions of deactivated cells are no longer necessary. Cell-face boundary conditions permit greater flexibility and simplification in the application of boundary conditions. This report discusses those features of KIVA-3 that differ from KIVA-II, the input required from a mesh generation preprocessor, and the output provided to a graphics postprocessor. Basic pre and post-processors are included in the KIVA-3 package, and are also described.

24136 (SAND–92-1168C) **Advanced diagnostics for in situ measurement of particle formation and deposition in thermally stressed jet fuels.** O'Hern, T.J.; Trott, W.M.; Martin, S.J.; Klavetter, E.A. Sandia National Labs., Albuquerque, NM (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. (AIAA–93-0363;CONF-930108–6: 31. American Institute of Astronautics and Aeronautics (AIAA) aerospace sciences meeting, Reno, NV (United States), 11-14 Jan 1993). Order Number DE93009798. Source: OSTI; NTIS; GPO Dep.

Two techniques have been developed and applied for in situ monitoring of processes involved in thermal degradation and solids deposition when several different aviation fuels are thermally stressed. Photon correlation spectroscopy is a dynamic light scattering technique that has proven to be a valuable tool for both real-time and post-test analysis of thermally stressed jet fuels. In situ measurements on post-stressed fuels have shown that significant particle formation can occur at temperatures as low as 120°C, and that relatively large particles (>200 nm mean hydrodynamic diameter) are formed at temperatures less than 200°C. Particle size tends to increase with increasing stress temperature over the range 125°–180°C, with substantial changes in the mean particle size occurring over ranges of only 10–20°C. Real-time measurements indicate that the mean particle diameter increases with increased exposure time at fixed temperature. An induction time is also evident in the real-time data, as an increasingly shorter exposure time is needed for particles to form in detectable size and concentration as the stress temperature is increased. The particle diameters measured post-test, when the fuel has cooled to room temperature, are larger than those measured at elevated temperatures, demonstrating the need for real-time measurements. A complementary experimental system using a quartz crystal microbalance has proven valuable for in situ determination of mass deposition rates during thermal stress tests. These data can be used to determine such kinetic factors as the global activation energies for the tested fuels and for quantitative evaluation of fuel thermal stability.

24137 (SAND–93-0106C) **Coupled thermal response of objects and participating media in fires and large combustion systems.** Gritzo, L.A.; Nicolette, V.F. Sandia National Labs., Albuquerque, NM (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930830–16: National conference and exposition on heat transfer, Atlanta, GA (United States), 8-11 Aug 1993). Order Number DE93012848. Source: OSTI; NTIS; GPO Dep.

When an object is subjected to the flow of combustion gas at a different temperature, the thermal responses of the object and the surrounding gas become coupled. The ability to model this interaction is of primary interest in the design of components which must withstand fire environments. One approach is to decouple the problem and treat the incident flux on the surface of the object as being emitted from a black-body at an approximate gas temperature. By neglecting the presence of the participating media, this technique overpredicts the heat fluxes initially acting on the object surface. The main goal of this work is to quantify the differences inherent in treating the combustion media as a blackbody as opposed to a gray gas. This objective is accomplished by solving the coupled participating media radiation and conduction heat transfer problem. A transient conduction analysis of a vertical flat plate was performed using a gray gas model to provide a radiation boundary condition. A 1-D finite difference algorithm was used to solve the conduction problem. The results are presented in terms of nondimensional parameters and include both average and local heat fluxes as a function of time. Early in the transient, a reduction in net heat fluxes of up to 65% was observed for the gray gas results as compared to the blackbody cases. This reduction in the initial net heat flux results in lower surface temperatures for the gray gas case. Due to the initially reduced surface temperatures, the gray gas net heat flux exceeds the net blackbody heat flux with increasing time. For radiation Blot numbers greater than 5, or values of the radiation parameter less than 10^{-2}. the differences inherent in treating the media as a gray gas are negligible and the blackbody assumption is valid. The results clearly indicate the importance of participating media treatment in the modeling of the thermal response of objects in fires and large combustion systems.

24138 (UCRL-JC–108866) **Molten salt oxidation as an alternative to incineration.** Gray, L.W.; Adamson, M.G.; Cooper, J.F.; Farmer, J.C.; Upadhye, R.S. Lawrence Livermore National Lab., CA (United States). Mar 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920527–13: 1992 incineration conference, Albuquerque, NM (United States), 11-14 May 1992). Order Number DE93009544. Source: OSTI; NTIS; INIS; GPO Dep.

Molten Salt Oxidation was originally developed by Rockwell International as part of their coal gasification, and nuclear-and hazardous-waste treatment programs. Single-stage oxidation units employing molten carbonate salt mixtures were found to process up to one ton/day of common solid and liquid wastes (such as paper, rags, plastics, and solvents), and (in larger units) up to one ton/hour of coal. After the oxidation of coal with excess oxygen, coal ash residuals (alumina-silicates) were found adhering to the vessel walls above the liquid level. The phenomenon was not observed with coal gasification-i.e., under oxygen-deficient conditions. Lawrence Livermore National Laboratory (LLNL) is developing a two-stage/two-vessel approach as a possible means of extending the utility of the process to wastes which contain high concentrations of alumina-silicates in the form of soils or clays, or high concentrations of nitrates including low-level and transuranic wastes. The first stage operates under oxygen-deficient ("pyrolysis") conditions; the second stage completes oxidation of the evolved gases. The process allows complete oxidation of the organic materials without an open flame. In addition, all acidic gases that would be generated in incinerators are directly metathesized via the molten Na_2CO_3 to form stable salts (NaCl, Na_2SO_4 etc.). Molten salt oxidation therefore avoids the corrosion problems associated with free HCl in incineration. The process is being developed to use pure O_2 feeds in lieu of air, in order to reduce offgas volume and retain the option of closed system operation. In addition, ash is wetted and retained in the melt of the first vessel which must be replaced (continuously or batch-wise). The LLNL Molten Salt unit is described together with the initial operating data.

24139 (WSRC-TR–92-106) **Pyrophoricity of uranium.** Peacock, H.B. Westinghouse Savannah River Co., Aiken, SC (United States). Mar 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93012138. Source: OSTI; NTIS; GPO Dep.

Uranium metal is pyrophoric and is capable of self-ignition in air provided conditions are favorable. Based on the data in this report, spontaneous ignition of spherical particles larger than 1/16 inch in diameter would not be expected to occur in air at room temperature (25°C). The rate at which the uranium surface oxidizes in air, balanced against the rate at which the heat of reaction is lost to the surroundings, determines whether spontaneous ignition can occur. Heat loss to the surrounding environment depends on the thermal conductivity of the uranium including the oxide coating, and on the temperature gradient. The ignition temperature for uranium metal particles is a function of particle geometry, size or specific surface area, heating rate gas composition as well as the quantity and distribution of powder within a storage container. The most important variable; however, affecting the ignition temperature for single samples was found by Schnizlein and Bingle to be the specific surface area (surface area per gram) of the uranium particles. The ignition temperatures calculated from ANL data for 1/16, 1/4, and 1/2 inch diameter spherical particles are 333, 375, and

399°C, respectively. The accuracy is believed to be about ±l0%, which is based on theoretical and experimental results.

24140 (DOE/FTR–93010290) **[International conference on computational engineering science]: Foreign trip report, December 15–24, 1992.** Gartling, D.K. Sandia National Labs., Albuquerque, NM (United States). 15 Jan 1993. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93010290. Source: OSTI; NTIS (US Sales Only); GPO Dep.

David Goffing attended the third International Conference on Computational Engineering Science (ICES '92) hosted by the Hong Kong University of Science and Technology. As with previous ICES meetings, the focus of the conference was the presentation of a broad base of research in the general areas of computational fluid and solid mechanics. The conference was held from December 17–22, 1992, in Hong Kong and was attended by approximately 500 delegates representing more than twelve countries; the major contributors to the meeting were the US and Japan. As part of a special symposium on Computational Fluid Dynamics (CFD), Gartling presented an invited paper and chaired one of the five CFD sessions. The paper presentation was titled "On the Question of Time-Dependence in Flow Over a Backward Facing Step," and was co-authored by John Torczynski of Sandia. The work summarized a careful study of a benchmark problem and concluded a debate on the stability of the benchmark flow that had been studied by the CFD community over the last two years. Most of the significant CFD papers at the conference dealt primarily with manufacturing and material processing applications with special emphasis on free boundary problems.

24141 (MLM–3780) **Cable friction study of molybdenum disulfide solid lubricant on 3×7 stainless steel cable.** Herman, G.J. Mound, Miamisburg, OH (United States). 6 May 1993. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-88DP43495. Order Number DE93013079. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A cable friction study was conducted to discover a way of minimizing cable wear in the Detonator Safing Strong Link. Three molybdenum disulfide lubricants were tested on cables that were subjected to a push/pull system simulating the cable action that occurs inside a weapon. Using the Taguchi Method, it was determined from the tests that Everlube 9000, a lubricant made by E/M Corporation, was the best choice and should serve as a solution to the cable friction wear problem with the Detonator Safing Strong Link.

24142 (CEA-CONF–11230) **TAO-2/SPARTE, a language-enhanced computer aided teleoperation system.** Gravez, P.; Fournier, R. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Direction des Technologies Avancees. 1991. [8p.] (CONF-9104418–: 2. France-Israel Symposium on Robotics. Advances in non-manufacturing robotics, Saclay (France), 8-10 Apr 1991). Order Number DE93626127. Source: OSTI; NTIS (US Sales Only); INIS.

TAO-2 is a computer system designed by CEA/DTA/UR for the remote control of nuclear servicing servomanipulators. It results from several years of research which have led to the current availability of an industrial product featuring highly advanced performances. For undersea applications, a development has also been carried out with CYBERNETIX for controlling the new hydraulic arm built by this company. An integral element of TAO-2 is the SPARTE language which deals with off-line task programming and focuses on combined manual, automatic and mixed control modes. Additionally, it takes into account the on-line part of the human operator relative to adjustment, monitoring and incident recovery. Other promising features are hybrid control specification, mechanisms for the management of external events and 'learning by touching' capabilities. The present paper describes the basic principles of TAO-2. It first recalls the fundamentals of Computer Aided Teleoperation (CAT). The functional and hardware architectures which implement the TAO-2 CAT concepts are then outlined. The next parts emphasize the original characteristics of the SPARTE control and programming language. The paper ends with a brief presentation of our approach for CAT symbolic control.

24143 (CONF-921275–, pp. 3-6) **Simulation on underground LPG supply system.** Katsuyama, K. (National Institute for Resources and Environment, Tsukuba (Japan)); Kato, S. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

A field experiment and a simulation were carried out on a system to bury a large-capacity container in the yard of a consumer's home, in place of the conventional bulk shipping container with 20 kg to 50 kg capacity, and supply LPG directly into the container using a small tank lorry. A calculus of finite difference was used to analyze how temperatures in the ground change with time, using a heat transfer equation including the soil thermal conductivity, specific heat, and density. The size of an underground bulk was assumed as a cylinder with a diameter of 1 m and a height of 1 m. Changes in the liquid phase temperatures associated with LPG supply were calculated using a formula by Kato et al. Considerations were given also on heat transfer between the ground and air, and between the ground and the container. For the case of freezing, thermal conductivity of frozen soil was used. A field experiment carried out with a flow rate of 6 kg/h indicated that the liquid temperature drops when a gas is used, and rises when its use is ceased. An error from the calculation result was as good as 4.7%. In a household using gas appliances with total capacity of 3.64 kg/h, the temperature of the liquid and that of soil around the container settled to a constant value in two weeks, and showed no further drop. 2 refs., 4 figs.

24144 (CONF-930403–37) **Overview of the West Valley Vitrification Facility transfer cart control system.** Bradley, E.C.; Rupple, F.R. Oak Ridge National Lab., TN (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ;AC07-81NE44139. From 5. topical meeting on robotics and remote systems; Knoxville, TN (United States); 26-29 Apr 1993. Order Number DE93010268. Source: OSTI; NTIS; INIS; GPO Dep.

Oak Ridge National Laboratory (ORNL) has designed the control system for the West Valley Demonstration Project Vitrification Facility transfer cart. The transfer cart will transfer canisters of vitrified high-level waste remotely within the Vitrification Facility. The control system will operate the cart under battery power by wireless control. The equipment includes cart mounted control electronics, battery charger, control pendants, engineer's console, and facility antennas.

24145 (CONF-930403–39) **Camera calibration in a hazardous environment performed in situ with automated analysis and verification.** DePiero, F.W.; Kress, R.L. Oak Ridge National Lab., TN (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 5. topical meeting on robotics and remote systems; Knoxville, TN (United States); 26-29 Apr 1993. Order Number DE93010274. Source: OSTI; NTIS; INIS; GPO Dep.

Camera calibration using the method of Two Planes is discussed. An implementation of the technique is described that may be performed in situ, e.g., in a hazardous or contaminated environment, thus eliminating the need for decontamination of camera systems before recalibration. Companion analysis techniques used for verifying the correctness of the calibration are presented.

24146 (CONF-930403–48) **Remote excavation using the telerobotic small emplacement excavator.** Thompson, D.H.; Burks, B.L.; Killough, S.M. Oak Ridge National Lab., TN (United

States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. From 5. topical meeting on robotics and remote systems; Knoxville, TN (United States); 26-29 Apr 1993. Order Number DE93010334. Source: OSTI; NTIS; INIS; GPO Dep.

Oak Ridge National Laboratory is developing remote excavation technologies for the Office of Technology Development, Robotics Technology Development Program. This work is being done to meet the need for remote excavation and removal of radioactive and contaminated buried waste at several DOE sites. System requirements are based on the need to uncover and remove waste from burial sites in a way that does not cause unnecessary personnel exposure or additional environmental contamination. Goals for the current project are to demonstrate dexterous control of a backhoe with force feedback and to implement robotic operations that will improve productivity. The Telerobotic Small Emplacement Excavator is a prototype system that incorporates the needed robotic and telerobotic capabilities on a commercially available platform. The ability to add remote dexterous teleoperation and robotic operating modes is intended to be adaptable to other commercially available excavator systems.

24147 (CONF-9305198–1) **Experiments in mobile robot navigation and range imaging.** Jones, J.P. (Oak Ridge National Lab., TN (United States)); Dorum, O.H.; Andersen, C.S.; Jacobsen, S.V.; Jensen, M.S.; Kierkeby, N.O.S.; Kristensen, S.; Madsen, C.B.; Nielsen, H.M.; Sorensen, E.; Sorensen, J.J.; Christensen, H.I. Oak Ridge National Lab., TN (United States). [1993]. 19p. Foundation (United States); Norges Teknisk-Naturv DOE Contract AC05-84OR21400. From 8. Scandanavian conference on image analysis; Tromso (Norway); 25-28 May 1993. Order Number DE93013280. Source: OSTI; NTIS; GPO Dep.

This paper describes some experiments in sensor-based mobile robot navigation conducted at Oak Ridge National Laboratory over the past several years. Two implemented systems are described. One uses a laser range camera as the sole sensor. The other uses, in addition, an array of sonars and a stereo vision system. We discuss a communication system for heterogeneous LAN-connected multiprocessor systems, useful in reasonably large development projects such as these. We also describe some work on the estimation of curvature in range images which introduces a new variational principle motivated by minimization of the change of curvature. Application of this principle is shown to produce results which are more desirable in some respects than those obtained using standard quadratic variation.

24148 (DOE/FTR–93011550) **[Travel to France to study the large ultra-precision machine tools for the SDI sponsored Alpha Laser Program]: Foreign trip report, August 19–September 6, 1992.** Stowers, I.F. Lawrence Livermore National Lab., CA (United States). 5 Oct 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (PEP–92-150). Order Number DE93011550. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The DoD /SDI-DEW Program has asked LLNL to study the feasibility of designing and constructing large ultra-precision machine tools for directly machining and inspecting precision components for the SDI sponsored Alpha Laser Program. Recently, they have asked if single crystal silicon can be machined as easily and accurately, on the LODTM machine at LLNL, as copper was formerly machined. It appears as this is not the case and we are actively seeking a method of reducing the wear of the diamond cutting tool that invariably occurs when silicon is machined.

24149 (DOE/FTR–93012814) **[Travel to France to audit the BR-100 model cask fabrication activities]: Foreign trip report, October 26–November 3, 1991.** Armontrout, C.A. B and W Fuel Co., Lynchburg, VA (United States). 6 Oct 1992. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-92NE34269. Order Number DE93012814. Travel to France to audit the BR-100 Model Cask fabrication activities.

24150 (DPSPU–74-124-6-Rev.1) **Safety analysis report: Packages SRL 4.5-ton Californium shipping cask (Packaging of fissile and other radioactive materials): Final report, Revision 1.** Whatley, V. Jr.; Mahoney, D.J.; Livingston, J.T. (comps.). Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Plant. Dec 1974. 88p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001 ;AC09-89SR18035. Order Number DE93013685. Source: OSTI; NTIS; GPO Dep.

This report discussed shielded cask especially designed for shipping californium-252 neutron sources is basically a spherical steel shell filled with water-extended polyester as the shielding material. The cask complies with requirements for shipping "large quantities" of radioactive materials as described in AEC Manual, Chapter 0529, "Safety Standards for Packaging of Radioactive and Fissile Materials." The cask also complies with IAEA "Regulations for the Safe Transport of Radioactive Materials," 1973 Revised Edition.

24151 (EGG-M–92580) **T-Rex system for operation in TRU, LLW, and hazardous zones: Transuranic storage area-retrieval enclosure program.** Kline, H.M. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Andreychek, T.P.; Beeson, B.K. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-930403–49: 5. topical meeting on robotics and remote systems, Knoxville, TN (United States), 26-29 Apr 1993). Order Number DE93010803. Source: OSTI; NTIS; INIS; GPO Dep.

There are a large number of sites around the world containing TRU (transuranic) waste, low level waste (LLW), and hazardous areas that require teleoperated, heavy lift manipulators with long reach and high precision to handle the materials stored there. Teleoperation of the equipment is required to reduce the risk to operating personnel to as-low-as-reasonably-achievable (ALARA) levels. The Transuranic Storage Area Remote Excavator system (T-Rex) is designed to fill this requirement at low cost through the integration of a production front shovel excavator with a control system, local and remote operator control stations, a closed-circuit television system (CCTV), multiple end effectors and a quick-change system. This paper describes the conversion of an off-the-shelf excavator with a hydraulic control system, the integration of an onboard remote control system, vision system, and the design of a remote control station.

24152 (EGG-WTD–10635) **Test plan for engineering scale electrostatic enclosure demonstration.** Meyer, L.C. EG and G Idaho, Inc., Idaho Falls, ID (United States). Feb 1993. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93012183. Source: OSTI; NTIS; INIS; GPO Dep.

This test plan describes experimental details of an engineering-scale electrostatic enclosure demonstration to be performed at the Idaho National Engineering Laboratory in fiscal year (FY)-93. This demonstration will investigate, in the engineering scale, the feasibility of using electrostatic enclosures and devices to control the spread of contaminants during transuranic waste handling operations. Test objectives, detailed experimental procedures, and data quality objectives necessary to perform the FY-93 experiments are included in this plan.

24153 (EUR–14497) **Remote laser machining for nuclear site under dismantling (ROLD Program).** Geffroy, J. (CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France)); Gonnord, J.; Alfille, J.P.; Beaucourt, P. de; Dobler, M.; Ermont, G.; Galey, D.; Garrec, P.; Hofman, M.; Marceau, M.; Mergy, M.; Noel, J.P.; Nomine, J.P. Commission of the European Communities, Luxembourg (Luxembourg). 1993. [116p.] (In French). Contract FI1D-0013F. Source: OSTI; NTIS (US Sales Only); INIS.

This report describes the design, development and manufacturing of a power laser cutting tool remotely-operated, adapted to nuclear installations dismantling. The technological choices adopted for the conception of the laser robot ROLD are presented,

as well as the coupling to a power laser in a real but not radioactive environment. A series of tests on sample cutting performances are presented. A complementary working program with respect to the initial one was intended for the development of an automatic cutting trajectory teaching system. A three dimensional laser camera, assisted by a proximity sensor by optical triangulation would allow to create a picture of the cutting scene which would have been used for the trajectory calculation. The trials have not yet been successful, but the results are presented in the report.

Tritium, a radioactive isotope of hydrogen, is used in many applications, including neutron production from the (d,t) reaction, radioluminescent lighting, helium doping of materials, and radiography. The Isotopes Section of the Oak Ridge National Laboratory (ORNL) has been involved in providing tritium gas and various tritium-containing materials to the international research, development, and production communities for more than 28 years. Many programs at ORNL and other facilities have benefited from the expertise developed within the Isotopes Section for preparing tritium-containing materials such as titanium or erbium tritide for use in neutron production through the development of radioluminescent lighting or through the use of tritium to implant ^{3}He in tensile specimens. A major consideration in all the operations is to minimize personnel exposure to tritium and to keep this exposure to a level that is as low as reasonably achievable (ALARA). Present and future tritium-processing operations are described. (author). Abstract only.

24156 (JAERI-M–92-192) **Calculations of reactivity effects caused by non-uniform concentration of nuclear fuel.** Okuno, Hiroshi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Sakai, Tomohiro; Shioda, Masayuki. Japan Atomic Energy Research Inst., Tokyo (Japan). Dec 1992. 112p. (In Japanese). Order Number DE93797510. Source: OSTI; NTIS; INIS.

Reactivity effects caused by non-uniformly distributed nuclear fuel concentration were studied through numerical calculations. At first, the criticality quantities of spherical and cylindrical ^{235}U-H_2O and aqueous solution of 5 wt% enriched $UO_2(NO_3)_2$ were obtained, whose fuel concentration distribution is linearly dependent on the square distance from the center of the fuel region. The optimum distributions of aqueous solutions of $UO_2(NO_3)_2$ and $Pu(NO_3)_4$ were obtained by flattening the fuel importance distribution. The effects of dimension and shape of fuel region and with/without reflector on the results of the optimum fuel distribution and neutron multiplication factor were also examined for 5 wt% ^{235}U-enriched uranium UO_2-H_2O fuel. The calculations revealed that the optimum fuel distribution had higher concentration in the center for overmoderated fuel, whereas higher on the periphery for undermoderated fuel. Reflector attached systems produced both centrally and peripherally high fuel distribution for optimum and more moderated fuel. The neutron multiplication factor of the optimum fuel distribution increased by 0 to 4 % relative to that of the uniform distribution. The outline of a computer code OPT-D to obtain the optimum fuel distribution by using the one-dimensional diffusion approximation, inclusive of its manual, was given in an appendix. (author).

24157 (JAERI-M–92-197) **A survey report for the turning of biped locomotion robot.** Kato, Ichiro (Waseda Univ., Tokyo (Japan)); Takanishi, Atsuo; Kume, Etsuo. Japan Atomic Energy Research Inst., Tokyo (Japan). Dec 1992. 52p. (In Japanese). Order Number DE93797511. Source: OSTI; NTIS; INIS.

A mechanical design study of biped locomotion robots is going on at JAERI within the scope of the Human Acts Simulation Program (HASP). The design study at JAERI is of an arbitrarily mobile robot for inspection of nuclear facilities. A survey has been performed for collecting useful information from already existing biped locomotion robots. This is a survey report for the turning of biped locomotion robot: the WL-10R designed and developed at Waseda University. This report includes the control method of turning, machine model and control system. (author).

24158 (JAERI-M–92-206) **Seismic analysis of plutonium glovebox by MSC/NASTRAN.** Hirata, Masaru (Japan Atomic Energy Research Inst., Oarai, Ibaraki (Japan). Oarai Research Establishment); Ishikawa, Kazuya; Korosawa, Makoto; Fukushima, Susumu; Hoshina, Hirofumi. Japan Atomic Energy Research Inst., Tokyo (Japan). Jan 1993. 55p. (In Japanese). Order Number DE93797557. Source: OSTI; NTIS; INIS.

Seismic analysis of the structural strength of gloveboxes is important for plutonium confinement evaluation. However, the analytical methods must be developed for evaluating the mutual displacement between the window frame and acrylic resin window panel with regard to plutonium confinement during an earthquake. Therefore, seismic analysis for a standard glovebox in Plutonium Fuel Research Facility at Oarai Research Establishment of JAERI has been conducted by FEM (Finite Element Method) computer code MSC/NASTRAN (MacNeal-Schwendler Corporation NASA Structural Analysis). Modelling of glovebox window frame has been investigated from the results of natural frequency analysis and static analysis. After the acquisition of a suitable model, displacement around the window frame and glovebox structural strength have been evaluated in detail by use of floor response spectrum analysis and time-history (transient response) analysis. (author).

24159 (JAERI-M–93-031) **Evaluation of effect of solution-density formula on criticality parameters.** Miyoshi, Yoshinori (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Hirose, Hideyuki; Ami, Norio; Sakurai, Satoshi. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1993. 37p. (In Japanese). Order Number DE93797609. Source: OSTI; NTIS; INIS.

Calculations of the criticality parameters have been performed for solution fuels such as uranyl nitrate, plutonium nitrate and their mixture by use of a newly proposed formula (SST formula) of the solution density. By comparison of the calculated infinitive multiplication factor and critical buckling using SST formula with those by the present formula based on Maimoni's and Burger's, the effect of the density formula for nitrate solution on the criticality calculation were studied. (author).

24160 (KCP–613-5037) **Machine tool error analysis: Final report.** Carnivale, G.L. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Apr 1993. 161p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE93013623. Source: OSTI; NTIS; GPO Dep.

This report addresses sources of geometric error in a machined part due to the error sources of the machine tool structure. Tests were conducted on a Cincinnati Milacron 3-axis T-10 Machining

Center which simulates equipment used in actual production at the Kansas City Division of AlliedSignal Inc. Results indicate that positioning inaccuracies of machine tools can be reduced by using error modeling and prediction to induce compensation.

24161 (LA-UR–93-197) **High temperature heat pipe experiments in low earth orbit.** Woloshun, K. (Los Alamos National Lab., NM (United States)); Merrigan, M.A.; Sena, J.T.; Critchley, E. Los Alamos National Lab., NM (United States). [1993]. 8p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930830–4: National conference and exposition on heat transfer, Atlanta, GA (United States), 8-11 Aug 1993). Order Number DE93007382. Source: OSTI; NTIS; INIS; GPO Dep.

Although high temperature, liquid metal heat pipe radiators have become a standard component on most high power space power system designs, there is no experimental data on the operation of these heat pipes in a zero gravity or micro-gravity environment. Experiments to benchmark the transient and steady state performance of prototypical heat pipe space radiator elements are in preparation for testing in low earth orbit. It is anticipated that these heat pipes will be tested aborad the Space Shuttle in 1995. Three heat pipes will be tested in a cargo bay Get Away Special (GAS) canister. The heat pipes are SST/potassium, each with a different wick structure; homogeneous, arterial, and annular gap, the heat pipes have been designed, fabricated, and ground tested. In this paper, the heat pipe designs are specified, and transient and steady-state ground test data are presented.

24162 (LA-UR–93-1025) **Material removal processes: Engineering mechanics consideration.** Anderson, C.A. Los Alamos National Lab., NM (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9304106–2: 1993 ASPE spring topical meeting, Tucson, AZ (United States), 13-15 Apr 1993). Order Number DE93010733. Source: OSTI; NTIS; GPO Dep.

In the material removal process called machining, a layer of material of constant thickness is removed from the workpiece by a wedge-shaped tool that travels parallel to the workpiece at a preselected depth. Even though the speed of relative movement between workpiece and tool is low (typical 1–10 M/S), the strain-rates in the workpiece near the tool can be high, on the order of 10^4-10^5 s^{-1}. When machining brittle materials or unlubricated ductile materials at low speed, the removed metal (or chip) will be discontinuous and made up of small fractured segments. On the other hand, when machining ductile material under lubricated conditions, the removed material forms a continuous coil. In this case, we can represent the material removal process as a steady-state process. In this presentation, we will restrict ourselves to orthogonal machining where the cutting edge is perpendicular to the relative motion-a situation also approximated by other material removal processes such as planing and broaching, and turning on a lathe.

24163 (LA-UR–93-1444) **Advanced Field Artillery System gun mount thermal management study: Phase 1 summary.** Merrigan, M. Los Alamos National Lab., NM (United States). 23 Mar 1993. 18p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93012668. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Los Alamos National Laboratory conducted a thermal management study for the AFAS and developed a preliminary design for a thermal control system for the AFAS. The primary component of the thermal management system is the heat exchanger. The heat exchanger is nominally 30-cm long and 17.78-cm in diameter. It employs a copper fin core through which water is circulated at a rate of approximately 13.5 gpm. The water is heated by 7°C in passing through the heat exchanger and undergoes a corresponding pressure drop of approximately 15 psi. Heat rejection to ambient air is accomplished through a water-air heat exchanger located remotely from the recoil modules.

24164 (MLM–3767) **Estimation of strain in 1-kW primary containment vessels by microstructural examination.** Schleitweiler, P.M.; Merten, C.W. Mound, Miamisburg, OH (United States). 19 Apr 1993. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-88DP43495. Order Number DE93013053. Source: OSTI; NTIS; GPO Dep.

Weld sections were analyzed and strain estimated in five 1-kW primary containment vessels submitted to the EG&G Mound Physical Metallurgy Group for evaluation. Four of the vessels had been subjected to compression testing and one was untested. Metallographic sectioning was done on regions of greatest deformation and on weld areas. Strain was estimated by measuring the grain deformation with a line intercept method.

24165 (NEA-CRP-L–331) **NEACRP comparison of codes for the radiation protection assessment of transportation packages. Solutions to problems 1 - 4.** Avery, A.F.; Locke, H.F. UKAEA Atomic Energy Establishment, Winfrith (United Kingdom). Materials Technology Div. Mar 1992. [141p.] Order Number DE93626125. Source: OSTI; NTIS (US Sales Only); INIS.

In 1985 the Reactor Physics Committee of the Nuclear Energy Agency initiated an intercomparison of codes for the calculation of the performance of shielding for the transportation of spent reactor fuel. The results of the application of a range of codes to the prediction of the dose-rates in the four theoretical benchmarks set to examine the attenuation of radiation through a variety of cask geometries are presented in this report. The contributions from neutrons, fission product gamma-rays and secondary gamma-rays are tabulated separately, and grouped according to the type of method of calculation employed. A brief discussion is included for each set of results, and overall comparisons of the methods, codes, and nuclear data are made. A number of conclusions are drawn on the advantages and disadvantages of the various methods of calculation, based upon the results of their application to these four benchmark problems.

24166 (NIIAR–17-800) **Automatic radiometric control system of technological process.** Kroshkin, N.I.; Nazarenko, V.I.; Safonov, V.A.; Krivosheev, V.A.; Loginov, V.D.; Sernov, I.E. Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (Russian Federation). 1990. [8p.] (In Russian). Order Number DE93626129. Source: OSTI; NTIS (US Sales Only); INIS.

A system of remote automatic control for radiochemical and technological processes connected with radioactive substances is described. The control system is created on the MERA-60 computer basis and block complex in the CAMAC format. The computer outer device complex admits two ADCs and controller block of the information output graphical mode that allows the computer to operate in the mode of pulse amplitude analysis by two independent inputs. The program of automatic control is made, the algorithms of spectra processing is proposed. The program provides for automatic operation of the apparatus, visual presenting of information about the process at the display, documenting of the control results with an accuracy evaluation. 2 refs.; 1 fig.

24167 (ORNL/TM–12337) **Whole-arm obstacle avoidance system conceptual design.** Wintenberg, A.L.; Butler, P.L.; Babcock, S.M.; Ericson, M.N.; Britton, C.L. Jr. Oak Ridge National Lab., TN (United States). Apr 1993. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012093. Source: OSTI; NTIS; INIS; GPO Dep.

Whole-arm obstacle avoidance is needed for a variety of robotic applications in the Environmental Restoration and Waste Management (ER&WM) Program. Typical industrial applications of robotics involve well-defined workspaces, allowing a predetermined knowledge of collision-free paths for manipulator motion. In the unstructured or poorly defined hazardous environments of the ER&WM Program, the potential for significant problems resulting from collisions between manipulators and the environment in which they are utilized is great. The conceptual design for a sensing system that will provide protection against such collisions is described herein. The whole-arm obstacle avoidance system consists of a set of sensor "bracelets," which cover the surface area of the manipulator links to the maximum extent practical, and a host processor. The host processor accepts commands from the robot control system, controls the operation of the sensors, manipulates data received from the bracelets, and makes the data available to the manipulator control system. The bracelets consist of a subset of the sensors, associated sensor interface electronics, and a bracelet interface. Redundant communications links between the

host processor and the bracelets are provided, allowing single-point failure protection. The system allows reporting of 8-bit data from up to 1000 sensors at a minimum of 50 Hz. While the initial prototype implementation of the system utilizes capacitance proximity sensor, the system concept allows multiple types of sensors. These sensors are uniquely addressable, allowing remote calibration, thresholding at the bracelet, and correlation of a sensor measurement with the associated sensor and its location on the manipulator. Variable resolution allows high-speed, single-bit sensing as well as lower-speed higher-resolution sensing, which is necessary for sensor calibration and potentially useful in control.

24168 **Material containment enclosure.** Carlson, D.O. To Dept. of Energy. 1 Apr 1991. USA patent application 7-678,387. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93008230. Source: OSTI; NTIS; GPO Dep.

An isolation enclosure and a group of isolation enclosures was designed which is useful when a relatively large containment area is required. The enclosure is in the form of a ring having a section removed so that a technician may enter the center area of the ring. in a preferred embodiment, an access zone is located in the transparent wall of the enclosure and extends around the inner perimeter of the ring so that a technician can insert his hands into the enclosure to reach any point within. The inventive enclosures provide more containment area per unit area of floor space than conventional material isolation enclosures.

24169 **Basic fluid system trainer.** Semans, J.P.; Johnson, P.G.; LeBoeuf, R.F. Jr.; Kromka, J.A.; Goron, R.H.; Hay, G.D. To Dept. of Energy. 30 Apr 1991. USA patent application 7-693,477. 19p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). N00024-79-C4026. Order Number DE93012011. Source: OSTI; NTIS; GPO Dep.

This invention, a trainer mounted and housed within a mobile console, is used to teach and reinforce fluid principles to students. The system trainer has two centrifugal pumps, each driven by a corresponding two-speed electric motor. The motors are controlled by motor controllers for operating the pumps to circulate the fluid stored within a supply tank through a closed system. The pumps may be connected in series or in parallel. A number of valves are also included within the system to effect different flow paths for the fluid. In addition, temperature and pressure sensing instruments are installed throughout the closed system for measuring the characteristics of the fluid, as it passes through the different valves and pumps. These measurements are indicated on a front panel mounted to the console, as a teaching aid, to allow the students to observe the characteristics of the system.

24170 (PNL–8638) **Computer-aided acquisition and logistics support (CALS): Concept of Operations for Depot Maintenance.** Bourgeois, N.C.; Greer, D.K. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 89p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93013125. Source: OSTI; NTIS; GPO Dep.

This CALS Concept of Operations for Depot Maintenance provides the foundation strategy and the near term tactical plan for CALS implementation in the depot maintenance environment. The user requirements enumerated and the overarching architecture outlined serve as the primary framework for implementation planning. The seamless integration of depot maintenance business processes and supporting information systems with the emerging global CALS environment will be critical to the efficient realization of depot user's information requirements, and as, such will be a fundamental theme in depot implementations.

24171 (SAND–92-0347) **Comparison of analytic Whipple bumper shield ballistic limits with CTH simulations.** Hertel, E.S. Jr. Sandia National Labs., Albuquerque, NM (United States). May 1993. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93015126. Source: OSTI; NTIS; GPO Dep.

A series of CTH simulations were conducted to assess the feasibility of using the hydrodynamic code for debris cloud formation and to predict any damage due to the subsequent loading on rear structures. Six axisymmetric and one 3-dimensional simulations were conducted for spherical projectiles impacting Whipple bumper shields. The projectile diameters were chosen to correlate with two well known analytic expressions for the ballistic limit of a Whipple bumper shield. It has been demonstrated that CTH can be used to simulate the debris cloud formation, the propagation of the debris across a void region, and the secondary impact of the debris against a structure. In addition, the results from the CTH simulations were compared to the analytic estimates of the ballistic limit. At impact velocities of 10 km/s or less, the CTH predicted ballistic limit lays between the two analytic estimates. However, for impact velocities greater than 10 km/s, CTH simulations predicted a ballistic limit larger than both analytical estimates. The differences at high velocities are not well understood. Structural failure at late times due to the time integrated loading of a very diffuse debris cloud has not been considered in the CTH model. In addition, the analytic predictions are extrapolated from relatively low velocity data and the extrapolation technique may not be valid. The discrepancy between the two techniques should be investigated further.

24172 (SAND–92-2236C) **Incentives for use of inelastic analysis in RAM transport container design.** Ammerman, D.J.; Heinstein, M.W. Sandia National Labs., Albuquerque, NM (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930205–62: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93012858. Source: OSTI; NTIS; INIS; GPO Dep.

The use of inelastic analysis methods instead of the traditional elastic analysis methods in the design of radioactive material (RAM) transport packagings leads to a better understanding of the response ofthe package to mechanical loadings. Thus, better assessment of the containment, thermal protection, and shielding integrity of the package after a structural accident event can be made. A more accurate prediction of the package response can lead to enhanced safety and also allow for a more efficient use of materials, possibly leading to a package with higher capacity and/or lower weight. This paper discusses the incentives for using inelastic analysis in the design of RAM shipping packages. Inelastic analysis provides an improved knowledge of the package behavior. It must be demonstrated that the use of inelastic analysis provides a better design to overcome the difficulties associated with this type of analysis. In this paper, comparisons between elastic and inelastic analyses are made to illustrate the differences in the two analysis techniques for two different types of packages. One is a package to transport a large quantity of RAM by rail with lead gamma shielding,and the other is a package to transport RAM by truck with depleteduranium gamma shielding. Analyses of the center-of-gravity-over-corner impacts will be compared for each package. The comparisons indicate thata package designed to just meet the elastic design criteria will actually undergo some yielding in the locations of highest stress. This results in two consequences in the predicted behavior of the cask. First,the overprediction of the stiffness of these yielded regions by theelastic analysis technique results in an underestimation of the stresses in other portions of the structure. Secondly, in an inelastic analysis, the yielding of a portion of a structure causes the force in thatregion to rise less rapidly than forces in adjacent regions.

24173 (SAND–92-2405C) **Data fusion for adaptive control in manufacturing: Impact on engineering information models.** Bray, O.H. Sandia National Labs., Albuquerque, NM (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930862–2: 1993 American Society of Mechanical Engineers (ASME) international computers in engineering conference and exposition, San Diego, CA (United States), 8-12 Aug 1993). Order Number DE93011555. Source: OSTI; NTIS; GPO Dep.

This paper addresses the impact of data fusion on engineering and manufacturing information systems. Data fusion is the integration and analysis of data from multiple sensors to develop a more accurate understanding of a situation and determine how to respond to it. (Sensor fusion, a related term, has a somewhat

different, more implementation oriented focus. The difference between these two concepts is addressed specifically in Section 1.) Although data fusion can be applied in many situations, this paper focuses on its application to manufacturing and how it changes some of the more traditional, less adaptive information models that support the design and manufacturing functions.

24174 (SAND–93-0588C) **Automating the operation of robots in hazardous environments.** Harrigan, R.W. Sandia National Labs., Albuquerque, NM (United States). 21 Feb 1993. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930736–2: 1993 Institute of Electrical and Electronics Engineers/Robotics Society of Japan (IEEE/RSJ) international conference on intelligent robots and systems (IROS), Yokohama (Japan), 26-30 Jul 1993). Order Number DE93009850. Source: OSTI; NTIS; GPO Dep.

Hazardous operations which in the past have been completed by technicians are under increased scrutiny due to high costs and low productivity associated with providing protective clothing and environments. As a result, remote systems are needed to accomplish many hazardous materials handling tasks such as the clean up of waste sites in which the exposure of personnel to radiation, chemical, explosive, and other hazardous constituents is unacceptable. Traditional remote operations have proven to have very low productivity when compared with unencumbered humans. Computer models augmented by sensing and structured, modular computing environments are proving to be effective in automating many unstructured hazardous tasks.

24175 (SAND–93-0678C) **Adding intelligence to conventional industrial robots.** Harrigan, R.W. Sandia National Labs., Albuquerque, NM (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930403–51: 5. topical meeting on robotics and remote systems, Knoxville, TN (United States), 26-29 Apr 1993). Order Number DE93011557. Source: OSTI; NTIS; INIS; GPO Dep.

Remote systems are needed to accomplish many tasks such as the clean up of waste sites in which the exposure of personnel to radiation, chemical, explosive, and other hazardous constituents is unacceptable. In addition, hazardous operations which in the past have been completed by technicians are under increased scrutiny due to high costs and low productivity associated with providing protective clothing and environments. Traditional remote operations have, unfortunately, proven to also have very low productivity when compare with unencumbered human operators. However, recent advances in the integration of sensors and computing into the control of conventional remotely operated industrial equipment has shown great promise for providing systems capable of solving difficult problems.

24176 (SAND–93-0931C) **Integration of rapid prototyping into design and manufacturing.** Atwood, C.L.; McCarty, G.D.; Pardo, B.T. Sandia National Labs., Albuquerque, NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9305176–1: Rapid prototyping and manufacturing '93 conference and exhibits, Dearborn, MI (United States), 10-13 May 1993). Order Number DE93011554. Source: OSTI; NTIS; GPO Dep.

The introduction of rapid prototyping machines into the market place promises to revolutionize the process of producing prototype parts with production-like quality. In the age of concurrent engineering and agile manufacturing, it is necessary to exploit applicable new technologies as soon as they become available. The driving force behind integrating these evolutionary processes into the design and manufacture of prototype parts is the need to reduce lead times and fabrication costs improve efficiency, and increase flexibility without sacrificing quality. Sandia Utilizes stereolithography and selective laser sintering capabilities to support internal design and manufacturing efforts. Stereolithography (SLA) is used in the design iteration process to produce proof-of-concept models, hands-on models for design reviews, fit check models, visual aids for manufacturing, and functional parts in assemblies. Selective laser sintering (SLS) is used to produce wax patterns for the lost wax process of investment casting in support of an internal Sandia National Laboratories program called FASTCAST which integrates experimental and computational technologies into the investment casting process. This presentation will provide a brief overview of the SLA and SLS processes and address our experiences with these technologies from the standpoints of application, accuracy, surface finish, and feature definition. Also presented will be several examples of prototype parts manufactured by the stereolithography and selective laser sintering rapid prototyping machines.

24177 (UCRL-CR–113495) **MRS-131 Program (WO 121722) Task No. 16: System level test final report.** Maybee, J.C. (Rocket Research Co., Redmond, WA (United States)). Lawrence Livermore National Lab., CA (United States); Rocket Research Co., Redmond, WA (United States). 1 Apr 1992. 174p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93012319. Source: OSTI; NTIS; GPO Dep.

This report summarizes the results of Task 16 of the MRS-131 Program. The objective of this task was to demonstrate the successful operation of the breadboard pumped propulsion system, using components previously designed and developed on the MRS-131 Program. The components were to be of flight design wherever possible. Prior to the system test, a series of bootstrap tests were to be conducted to verify the capability of the system to bootstrap from propellant tank pressure (50 psia) to full operating pressure (> 1200 psia). The bootstrap tests were very successful; the results showed that the system could bootstrap under all anticipated operating conditions, with margin. The system testing conducted in December, 1991 was only partially successful. Successful bootstrap and limited pulse-mode performance were demonstrated during the test series, however, problems encountered with the 3-way warm gas pump valves forced a curtailment of the test series prior to completion. This precluded demonstration of steady-state performance and mission duty cycle performance. Details on the results of these tests in addition to the design of the system are contained in this report. In addition to the two test series described above, expulsion tests were conducted with RRC heavyweight propellant tanks. A computer model of the pumped propulsion system was created to predict the system's overall performance and establish design specifications for components. As test data became available from component and sub-system tests the model was updated and correlated. The complexity of the model was also increased during this process as more was teamed about the system. This has resulted in a model with a high degree of fidelity in predicting system behavior under a variety of conditions. The model has been quite useful in simulating the effects of component performance changes and the impact these had upon overall system performance.

24178 (UCRL-JC–106140) **Long-range maintenance planning: A case study of working system.** Flanigan, M.J. Lawrence Livermore National Lab., CA (United States). Oct 1991. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9111312–1: 8. international maintenance conference, Dallas, TX (United States), 12-14 Nov 1991). Order Number DE93013088. Source: OSTI; NTIS; GPO Dep.

This paper addresses the development of the Lawrence Livermore National Laboratory (LLNL) Maintenance Planning System (MPS). The pitfalls encountered and overcome, and future expansion plans. The MPS provides the ability to develop and track long-range programs, i.e., conversion of chlorofluorocarbon (CFC) equipment to hydrochlorofluorocaron (HCFC), roofing, roads, etc., in addition to providing invaluable information and data for current year budget justification.

24179 (UCRL-JC–110015) **Monte Carlo code criticality benchmark comparisons for waste packaging.** Alesso, H.P.; Annese, C.E.; Buck, R.M.; Pearson, J.S.; Lloyd, W.R. Lawrence Livermore National Lab., CA (United States). Jul 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9207102–78: Institute of Nuclear Materials Management (INMM) annual meeting, Orlando, FL (United States), 19-22 Jul 1992). Order Number DE93012499. Source: OSTI; NTIS; INIS; GPO Dep.

COG is a new point-wise Monte Carlo code being developed and tested at Lawrence Livermore National Laboratory (LLNL). It solves the Boltzmann equation for the transport of neutrons and photons. The objective of this paper is to report on COG results for

criticality benchmark experiments both on a Cray mainframe and on a HP 9000 workstation. COG has been recently ported to workstations to improve its accessibility to a wider community of users. COG has some similarities to a number of other computer codes used in the shielding and criticality community. The recently introduced high performance reduced instruction set (RISC) UNIX workstations provide computational power that approach mainframes at a fraction of the cost. A version of COG is currently being developed for the Hewlett Packard 9000/730 computer with a UNIX operating system. Subsequent porting operations will move COG to SUN, DEC, and IBM workstations. In addition, a CAD system for preparation of the geometry input for COG is being developed. In July 1977, Babcock & Wilcox Co. (B&W) was awarded a contract to conduct a series of critical experiments that simulated close-packed storage of LWR-type fuel. These experiments provided data for benchmarking and validating calculational methods used in predicting K-effective of nuclear fuel storage in close-packed, neutron poisoned arrays. Low enriched UO2 fuel pins in water-moderated lattices in fuel storage represent a challenging criticality calculation for Monte Carlo codes particularly when the fuel pins extend out of the water. COG and KENO calculational results of these criticality benchmark experiments are presented.

24180 (UCRL-JC–111218) **Application of an interactive controlled gantry robot in a glove box environment.** Merrill, R. Lawrence Livermore National Lab., CA (United States). Apr 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930491–3: International robots and vision conference, Detroit, MI (United States), 6-8 Apr 1993). Order Number DE93014421. Source: OSTI; NTIS; GPO Dep.

Automating special nuclear materials processing in glove boxes is required to remove the operator from radiation exposure and meet new DOE exposure guidelines. The viability of using robots to achieve this capability has been well established at Lawrence Livermore National Laboratory. From this operational experience it has become clear that there is a need for interactive glove box gantry robot controls to provide the operator with a capability for intervening to recover from unexpected upsets conditions and to carryout one-of-a kind operations which do not lend themselves to autonomous execution. This paper describes the interactive control features required, the developments achieved thus far and the plans for meeting the remaining needs.

24181 (UCRL-JC–112894) **A methodology for calculating the response of structures to earthquakes on specific faults.** McCallen, D.B.; Heuze, F.E.; Kasameyer, P.W. Lawrence Livermore National Lab., CA (United States). Mar 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9306160–1: 6. international conference on soil dynamics and earthquake engineering, Bath (United Kingdom), 14-16 Jun 1993). Order Number DE93012313. Source: OSTI; NTIS; GPO Dep.

We are developing a methodology chain to estimate the response of structures to large earthquakes from specific faults. The methodology consists of three distinct steps: generation of synthetic bedrock motion at the site of the structure due to a postulated large earthquake; nonlinear effective stress analysis of the soil response at the site to transform bedrock motion to surface motion; and linear/nonlinear finite element analysis of the structure based on the predicted surface motions. Progress in all steps is reported here.

24182 (UCRL-JC–113083) **Demonstration of automated robotic workcell for hazardous waste characterization.** Holliday, M.; Dougan, A.; Gavel, D.; Gustaveson, D.; Johnson, R.; Kettering, B.; Wilhelmsen, K. Lawrence Livermore National Lab., CA (United States). Feb 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93008678. Source: OSTI; NTIS; INIS; GPO Dep.

An automated robotic workcell to classify hazardous waste stream items with previously unknown characteristics has been designed, tested and demonstrated The object attributes being quantified are radiation signature, metal content, and object orientation and volume. The multi sensor information is used to make segregation decisions plus do automatic grasping of objects. The work-cell control program uses an off-line programming system by Cimetrix Inc. as a server to do both simulation control as well as actual hardware control of the workcell. This paper will discuss the overall workcell layout, sensor specifications, workcell supervisory control, 2D vision based automated grasp planning and object classification algorithms.

24183 (UCRL-LR–113247) **The national machine tool partnership: Final report and recommendations of the Machine Tool Task Team.** Barlow, T.M. (Lawrence Livermore National Lab., CA (United States)); Law, D.A.; Plymale, D.L.; Williams, T.L. Lawrence Livermore National Lab., CA (United States). Apr 1993. 68p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93012438. Source: OSTI; NTIS; GPO Dep.

This report describes the work of the Machine Tool Task Team, which was formed in June, 1992, by the US Department of Energy in response to a request by the National Security Advisor to the President, Brent Scowcroft, who asked the Department to "...examine which research and development efforts in the national laboratories could benefit the domestic machine tool industry and ... recommend appropriate investment and technology transfer to realize such benefit." The Team included representatives from the Lawrence Livermore, Los Alamos, and Sandia National Laboratories and the Oak Ridge Y-12 Plant. The report serves two purposes: (1) to further inform appropriate organizations and individuals concerning the status and trends in the US machine tool industry and (2) to describe a plan for a coordinated effort to strengthen both the infrastructure and the technological capabilities within the industry. The report includes two principal sections, in keeping with its dual purpose. Part I describes the Task Team's findings concerning the machine tool industry and summarizes several of the publicly funded programs that have been created to strengthen it over the past several years. It also briefly describes the needs of the industry that are not being met by these programs. Part III of the report describes the plan developed by the Task Team for "The National Machine Tool Partnership," a coordinated, federally funded program designed to take advantage of the technologies and technical capabilities that have been developed and deployed by the national laboratories and facilities.

24184 (WSRC-MS–92-408) **The need of coupled differential and integral spectral radiation measurements.** Zino, J.F. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93014744. Source: OSTI; NTIS; INIS; GPO Dep.

The criticality safety community has historically directed a significant amount of effort toward attempting to quantify the integral behavior of fissioning systems via critical and subcritical experimental measurements. Some typical integral characteristics include critical masses, geometries, or concentrations for particular fissile isotopes in different chemical forms. While information such as this can be invaluable for determining criticality safety operating limits and for benchmarking computational methods, it is only a part of what is necessary for analyzing criticality accident alarm detectors. These analyses also require determination of the differential behavior of the leakage radiation (neutron and/or photon) emanating from the source, and an integral estimate of the corresponding detector dose response. This paper addresses part of the work done at the Savannah River Technology Center to validate version 4.2 of the Monte Carlo transport code MCNP for application to criticality detector response analysis. Additionally, the paper discusses some observations about existing experimental data which can be used for code validation, as well as the need for further experiments.

24185 (Y/DD–588) **Migration of nuclear criticality safety software from a mainframe to a workstation environment.** Bowie, L.J.; Robinson, R.C.; Cain, V.R. Oak Ridge Y-12 Plant, TN (United States). Jan 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. (CONF-930601–14: American Nuclear Society (ANS) annual meeting, San Diego, CA (United States), 20-24 Jun 1993). Order Number DE93011838. Source: OSTI; NTIS; INIS; GPO Dep.

The Nuclear Criticality Safety Department (NCSD), Oak Ridge Y-12 Plant has undergone the transition of executing the Martin Marietta Energy Systems Nuclear Criticality Safety Software (NCSS) on IBM mainframes to a Hewlett-Packard (HP) 9000/730

workstation (NCSSHP). NCSSHP contains the following configuration controlled modules and cross-section libraries: BONAMI, CSAS, GEOMCHY, ICE, KENO IV, KENO Va, MODIIFY, NITAWL SCALE, SLTBLIB, XSDRN, UNIXLIB, albedos library, weights library, 16-Group HANSEN-ROACH master library, 27-Group ENDF/B-IV master library, and standard composition library. This paper will discuss the method used to choose the workstation, the hardware setup of the chosen workstation, an overview of Y-12 software quality assurance and configuration control methodology, code validation, difficulties encountered in migrating the codes, and advantages to migrating to a workstation environment.

24186 (Y/DV–1191) **Ultrasonic cleaning as a replacement for chlorinated solvents.** Thompson, L.M. (Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States)); Eichholtz, R.L. Oak Ridge Y-12 Plant, TN (United States). 12 Apr 1993. 14p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OS21400. (CONF-930647–4: 86. annual meeting and exhibition of the Air and Waste Management Association, Denver, CO (United States), 13-18 Jun 1993). Order Number DE93013253. Source: OSTI; NTIS; GPO Dep.

Chlorinated solvents have long been used in industry for cleaning purposes. These solvents were non-flammable, thought to be relatively of low toxicity, and worked. However, these solvents are now thought to cause environmental and health problems. Methyl chloroform (1,1,1-trichloroethane or TCA) and trichlorotrifluoroethane (CFC-113) are considered ozone depleting substances and are being regulated as such. The United States is a signatory to the Montreal Protocol and its amendments which call for a phase-out of the production of CFC-113 by the year 2000 and TCA by the year 2005. There is a move afoot to change these phase-out dates to December 31, 1995, although at this time there has been no official action taken. Other chlorinated solvents such as methylene chloride and perchloroethylene (perk) have been labeled as suspect carcinogens. Due to these health concerns, the Occupational Health and Safety Administration (OSHA) has issued proposals to lower the permissible exposure levels of these substances. All of these solvents are also considered Resource Conservation and Recovery Act (RCRA) wastes. Thus, the wastes must be handled under strict guidelines. Due to all of these concerns, finding alternatives for these solvents has become attractive. Personnel at the Martin Marietta Energy Systems Y-12 Plant in Oak Ridge, Tennessee, conducted numerous studies which investigated the use of ultrasonic cleaning with aqueous detergent as a substitute for vapor degreasing with chlorinated solvents. The first ultrasonic cleaner was installed in the plant in 1984 and numerous other cleaners have followed. Because of the success of this substitution program, personnel at the United States Army Environmental Center have funded a project to investigate the use of ultrasonics with aqueous detergent as a substitute for chlorinated solvents used in cleaning operations at the Army depots.

24187 (Y/DX–2150) **Enterprise Technologies Deployment for Agile Manufacturing.** Neal, R.E. Oak Ridge Y-12 Plant, TN (United States). Nov 1992. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE93013257. Source: OSTI; NTIS; GPO Dep.

This report is intended for high-level technical planners who are responsible for planning future developments for their company or Department of Energy/Defense Programs (DOE/DP) facilities. On one hand, the information may be too detailed or contain too much manufacturing technology jargon for a high-level, nontechnical executive, while at the same time an expert in any of the four infrastructure fields (Product Definition/Order Entry, Planning and Scheduling, Shop Floor Management, and Intelligent Manufacturing Systems) will know more than is conveyed here. The purpose is to describe a vision of technology deployment for an agile manufacturing enterprise. According to the 21st Century Manufacturing Enterprise Strategy, the root philosophy of agile manufacturing is that "competitive advantage in the new systems will belong to agile manufacturing enterprises, capable of responding rapidly to demand for high-quality, highly customized products." Such agility will be based on flexible technologies, skilled workers, and flexible management structures which collectively will foster cooperative initiatives in and among companies. The remainder of this report is dedicated to sharpening our vision and to establishing a framework for defining specific project or pre-competitive project goals which will demonstrate agility through technology deployment.

24188 (CONF-8810234–, pp. 7-19) **An experimental study of turbulent mixing by Rayleigh-Taylor instabilities and a two-fluid model of the mixing phenomena.** Andrews, M.J. (Princeton Univ., NJ (US)). Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

A simple experiment has been used to quantitatively investigate turbulent mixing at an unstable interface when the interface is subject to a large two-dimensional disturbance. The introduction of a small amplitude long wavelength does little to alter the early time development of a planar mixed region, but at late times causes a large overturning motion that tends to thin the planar mixed region and accelerate the overall mixing process. Data have been collected from the experiment by way of image analysis of experimental photographs. These data serve as a source of information for the development of a "two-fluid" model of the mixing process. A "two-fluid" model has been developed to describe the turbulent mixing by Rayleigh-Taylor instabilities of the two different density fluids investigated in the experimental study above. A one-dimensional model was employed for the planar mixing experiments; here attention is focused on the development of a physically plausible equation to describe the length-scale development within the mixed region. The one-dimensional model was then extended to two-dimensions for the overturning experiments, and terms are added to account for thinning of the mixing region at late times. Data collected from the experiments are used to validate the model and to determine several model constants. The two-fluid model successfully simulates the experimental results and is recommended for further application to turbulent mixing processes in buoyant environments.

24189 (CONF-8810234–, pp. 21-37) **Compressibility influences on boundary-layer transition.** Bushnell, D.M. (NASA Langley Research Center, Hampton, VA (US)); Malik, M.R. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

Paper briefly summarizes the influences of increasing Mach number upon the various stages of boundary-layer transition including body flow field processing of incident stream disturbances and normal mode amplification. Other compressibility unique or altered phenomena discussed include (a) outward movement of the critical layer and the related "precursor" transition, (b) flow chemistry, (c) shock waves, and (d) the all pervasive roughness issue. Paper concludes with consideration of ground simulation and prediction of high-speed transition.

24190 (CONF-8810234–, pp. 39-50) **Quasisymmetry of flows and chaos of streamlines.** Chernikov, A.A. (Space Research Institute, Moscow (RU)); Sagdeev, R.Z.; Zaslavsky, G.M. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

The onset of turbulence may be preceded by development of ordered spatial structures. Such structures play a prominent role in mixing and advection processes. Presence of these structures can lead to chaotic spatial distribution of streamlines and to random walk of passive particles along the streamlines. Examples of such particle mixing are well known, they are the ABC-flow, and the flow between rotating cylinders. In connection with these phenomena

some general questions arise concerning the structural mixing: (1) which kinds of structures are admissible; (2) which structures can lead to mixing of streamlines; (3) what are the laws of transport of passive particles? Here we discuss the first two questions which are tightly connected with modern problems of nonlinear dynamics. The part of the paper devoted to symmetry of the structures is restricted to incompressible flows. This provides the simplest way to deduce possible types of flow organization. We further restrict ourselves to the Beltrami-type flows. Special interest in such flows is associated with instability of large-scale modes obeying the Beitrami condition in fluids with strongly developed turbulence. It is plausible that extended regions occupied by Beltrami flows can be present in turbulent flows. It is possible to say that flows can be "beltramized." We have shown that stationary hydrodynamic Beltrami flows can possess an arbitrary symmetry of quasi-crystallic type. Not withstanding the regular character of the structures, the flow also includes elements of irregularity, stochasticity. In some regions of space, the streamlines are distributed chaotically. The concluding part of the paper is devoted to chaos of streamlines in stationary Rayleigh-Benard convection. It is shown that three-dimensional stationary flow with hexagonal cells produces a spatial web of finite thickness within which the chaotic streamlines are concentrated.

24191 (CONF-8810234–, pp. 51-60) **Evolution of the laser ablatively driven Rayleigh-Taylor mix layer.** Emery, M.H. (Naval Research Laboratory, Washington, DC (US)); Gardner, J.H. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

The Rayleigh-Taylor (RT) instability occurs whenever a dense fluid is accelerated by a fluid of lower density. Perturbations on the interface between the two fluids are predicted to grow exponentially in time with a growth rate $\gamma = (Akg)^{\frac{1}{2}}$, where the Atwood number $A = (\rho h - \rho l)/(\rho h+\rho l)$, ρh (ρl) is the density of the heavy (light) fluid, the wavenumber $k = 27\pi/\lambda$, λ is the wavelength of the perturbation and g is the acceleration. When the amplitude of the perturbation (η) becomes of order of $\lambda/2\pi$, the sinusoidal surface disturbance mutates to rounded columns of "light" fluid rising into the "heavy" fluid which, in turn, is funneled downward. This is the classical bubble-and-spike structure. It is at about this amplitude that the RT exponential growth transitions into a nonlinear "free-fall" regime. The evolution of the bubble (spike) is now well described $\eta b=\alpha b gt^2/2$ ($\eta s=\alpha s gt^2/2$, where $\eta b(\eta s)$ is the amplitude of the bubble (spike) and αb (αs) is the free-fall reduction factor for the bubble (spike). Typically $\alpha b \leq 1$. In addition, the velocity of the bubble rise is $\propto (g\lambda)^{\frac{1}{2}}$). Thus for classical, incompressible RT in the presence of in any perturbation wavelengths, the shortest wavelength modes will grow the fastest, saturate the earliest and then the larger bubbles will subsume the smaller bubbles and larger and larger structures will dominate the flow. This tendency for the bulk of the energy to concentrate in the long wavelength modes means that fluid elements with like signed vorticity must tend to group together; in no other way is it possible for the scale of the velocity distribution to increase.

24192 (CONF-8810234–, pp. 61-73) **Similarity theory of incompressible random Rayleigh-Taylor instability.** Freed, N. (NRCN, Beer-Sheva (IL)); Ofer, D.; Shvarts, D.; Orszag, S.A. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

In this Note, we show how a detailed analysis of recent high resolution two-dimensional numerical simulations of low Mach number (incompressible) random Rayleigh-Taylor instability allows the formulation and explicit perturbative solution of a mathematical model that embodies key features of these flows. The results are in good agreement with both the numerical simulations and with experiment. Some typical interfacial contours from the numerical simulations of Rayleigh-Taylor instability at density ratios $\alpha = 2 : 3{,}1 : 3{,}1 : 20$ [(Atwood ratios $A = (1 - \alpha)/(1 + \alpha)$ of 1/5, 1/2, 19/21, respectively)] are given in Figure 1; the numerical results are obtained using an ALE (Arbitrary Lagrangian-Eulerian) compressible flow code, supplemented by a novel and accurate interface tracking scheme, at a spatial resolution of 200x200 cells (run on a superworkstation).

24193 (CONF-8810234–, pp. 75-84) **Pseudo-spectral numerical simulations of sub and supersonic compressible viscous flows.** Gauthier, S. (Centre d'Etudes de Limeil-Valenton, Villeneuve (FR)). Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

Stability and transition to turbulence have been the object of a considerable interest in the past fifteen years. However, the mechanism by which a flow becomes chaotic has been studied, essentially, for thermal convection of incompressible fluids. Numerical simulations of such flows are usually carried out with the spectral methods owing to their high accuracy. In some situations, for example in stellar convection or in laser driven fusion, the stratification of the fluid can no longer be ignored and we have to use the full Navier-Stokes equations. Since the pioneering work of Graham, some papers have been devoted to the simulation of compressible convection. In the special case of fixed heat flux Yamaguchi found supersonic solutions even at low Rayleigh numbers. From a numerical point of view, viscous compressible flows involve very different time scales which lead to long time runs. A Fourier expansion is used in the horizontal direction. The expansion in the Chebyshev polynomials used in the inhomogeneous direction leads to severe time step constraints due to the high resolution on the boundaries. However, in compressible flows, viscous and thermal diffusion terms are nonlinear. This nonlinearity leads to use iterative methods such as suggested by Orszag. In the first version of the code, only vertical diffusion terms were solved implicitly by an iterative method preconditioned by the time independent Chebyshev approximation of the diffusion operator. In this paper we present a more implicit version where convective terms are treated simplicity and all diffusion terms are handled with an iterative method preconditioned by the finite difference approximation of the diffusion operator. We used both numerical schemes to compute sub and supersonic steady state solutions obtained with radiative boundary conditions.

24194 (CONF-8810234–, pp. 85-93) **Statistical theories of Rayleigh-Taylor instability for compressible fluids.** Glimm, J. (New York Univ., NY (US)); Li, X.L.; Zhang, Q.; Menikoff, R.; Sharp, D. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. Grant DMS-83-1229. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

Statistical theories for the outer envelope of the Rayleigh-Taylor mixing layer refer to a simplified dynamics of fundamental modes and their interactions. These modes are bubbles of light fluid entrained in the mixing layer between the undisturbed light and heavy fluids. The dynamics can be understood in terms of the motion of a single mode and the interactions between modes. The single mode dynamics has to be solved self-consistently in a background field of random bubbles. The dominant interaction is bubble merger, i.e. the spreading of larger bubbles at the bubble envelope. Merger leads to dynamically increasing length scales, and thus to a dynamic renormalization of scaling dimensions. The mechanism for bubble merger is the differential motion of physically adjacent single bubble modes. This paper is focused on the above topics: single bubble motion, bubble interactions and statistical models.

24195 (CONF-8810234–, pp. 95-104) **Molecular mixing in Rayleigh-Taylor instability.** Linden, P.F. (Univ. of Cambridge (GB)); Redondo, J.M.; Caulfield, C.P. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

The amount of mixing at the molecular level at various stages during the growth of Rayleigh-Taylor instability is investigated in a

series of laboratory experiments. Instability is produced at an interface between two miscable liquids, brine and fresh water, with zero surface tension. The brine, density $\rho + \Delta\rho$ with $\Delta\rho > 0$, is placed on top of a layer of fresh water, density ρ, and separated from it by a horizontal barrier. Both liquid layers are initially at rest, and the instability is initiated by removing the barrier horizontally. Measurements consist of visual observations of the flow using fluorescent dye and shadow-graphs. Quantitative measurements of the amount of mixing are obtained from analysis of dye intensities profiles during the growth of the instability. These measurements give an integrated value (across the width of the mixing region) of the amount of mixing. A conductivity probe has been used to make point measurements of the salinity. These have been correlated with visual observations of relate changes in salinity with specific mixing processes.

24196 (CONF-8810234–, pp. 105-116) **Is a laminar flame front a passive surface of the turbulent field?.** Mantzaras, J. (Princeton Univ., NJ (US)); Felton, P.G.; Bracco, F.V. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

The three-dimensional structure of the turbulent flame in premixed propane/air charges was examined by visualizing simultaneously four parallel planar sections through the flame with a time resolution of 10 ns and a spatial resolution as low as 200 ϕm. The ratio of the turbulent intensity u' to the laminar flame speed S_l ranged from 0.5 to 25 and the ratio of the Kolmogorov length scale to the laminar flame thickness from 0.2 to 5. The interface between reactants and products is: highly wrinkled; continuous; without islands of reactants and products; with only few cusps; with some "fingers" of products; and of fractal geometry. The fractal dimension increases with u'/S_l but seems to tend to a maximum value of about 2.38. This is also the value measured in non-reacting turbulent flows, thus suggesting that the interface between reactants and products may act as a constant property passive scalar surface under certain conditions. If the local and instantaneous turbulent flame speed is related to the fractal dimension, then significant inhomogeneities in this speed are found even though the turbulent field is rather homogeneous and isotropic.

24197 (CONF-8810234–, pp. 117-124) **The stability of vortex arrays.** Saffman, P.G. (California Institute of Technology, Pasadena (US)). Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

The seminal observations by Brown & Roshko (1974) of large scale coherent structures in the turbulent mixing layer have stimulated large amounts of work on the question of the extent to which turbulent flows can be modelled by inviscid laminar dynamics. We wish to know if such modelling can lead to quantitative predictions as well as provide qualitative insights into the mechanisms of the evolution of the turbulent flows. The jury is still out on this question, and more problems have been raised than have been solved, but whatever the final conclusions, there is no doubt that a significant increase in the understanding of vortex dynamics has resulted from the effort. As an aside, it is said that the eye of the artist can see deeper into nature than the trained scientist. The drawings by Leonardo da Vinci of coherent structures and van Gogh's painting "Starry Night", which resembles closely the pairing process of coherent structures in the mixing layer, illustrate this adage.

24198 (CONF-8810234–, pp. 127-136) **Vortex formation in the wake of a flat plate for subsonic and supersonic freestream mach numbers.** Althaus, W. (Aerodynamisches Institut RWTH Aachen (DE)); Limberg, W.; Krause, E. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

The interaction of a straight oblique shock with a supersonic turbulent wake of a flat plate was studied experimentally by means of Laser-Doppler-Anemometry and Mach-Zehnder interferometry. Investigated were the changes of the time-averaged velocity, the Reynolds stresses, the turbulence intensity across the shock and instantaneous density profiles. After completion of the experiments with a smooth plate, the investigation was extended to flows about flat plates with rough surfaces. The roughening of the surfaces was achieved by pasting sandpaper on to both sides of the plate. It was found that a detectable vortex street was formed in the wake in subsonic and supersonic flow, if the following three conditions are met: First, the relative roughness had to exceed a certain critical value, second, the trailing edge had to be sharp, i.e. no rounded corners, and third, the sandpaper should not extend to the trailing edge, but should end at a certain distance upstream from it. In a second series of experiments the shedding frequency was measured with Laser-Schlieren optics and the density drop in the vortex cores was evaluated with holographic interferometry in two wind tunnels. In addition, the time averaged velocity profiles were measured as before for undisturbed and shock-disturbed flow. The comparison of the results is discussed in this paper. Finally, an attempt was made to explain the formation of the vortex street in terms of absolute and convective instability. In order to do so, the Raleigh-equation was solved on the basis of time-averaged velocity profiles, measured in the near wake. First results indicate that the predicted Strouhal number is in rather close agreement with the one observed in the corresponding experiment.

24199 (CONF-8810234–, pp. 137-159) **Compressibility in turbulence generation and mixing.** Boris, J.P. (Naval Research Lab., Washington, DC (US)). Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

This paper considers some of the physical mechanisms by which fluid compressibility causes the generation of turbulence and affects turbulent mixing. All fluid velocity fields are composed of a rotational component, the curl of the velocity, a compressional component, the divergence of the velocity, and a potential component which is both curl and divergence free. In studying the physics of compressibility in turbulent mixing, different situations are distinguished by categorizing not only the curl and divergence currently in the flow but also by the existence of other properties induced by the prior effects of both rotation and compression. In this paper I will use the term "passive" to describe the integrated effects of prior compressibility which is currently influencing the flow from "active" compressibility effects stemming from compression or expansion accelerations occurring dynamically in the system. These active and passive compressional interactions with rotational flow feed on each other in a dynamic three-stage cycle where fluid dynamic instabilities cascade through spatial and spectral scales to create a very complex flow field. These convoluted surfaces in turn enhance molecular diffusion and transport between the separate materials, thus changing the overall energy balance in the system. This changed energy balance, in turn feeds back into the fluid dynamic channels of instability, closing the cycle. In our earlier work involving compressible systems, these passive and active roles of compressibility were encountered primarily in the context of reactive flows with turbulence. Combustion, reactive shocks and detonation, as sources of strong and rapid compressibility effects, naturally are associated with compressible turbulence, empowering such relatively passive expansion-driven phenomena as bouyancy and vortex bursting as well as the more active, shock-driven situations.

24200 (CONF-8810234–, pp. 161-170) **Inviscid simulations of turbulent shear layers - mean flow analysis.** Chien, K.Y. (Naval Surface Warfare Center, Silver Spring, MD (US)); Ferguson, R.E.; Kuhl, A.L.; Glaz, H.M.; Colella, P. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

Effects of density and velocity variations between two streams of an unconfined, spatially-developing shear layer are studied by numerical solutions of the time-dependent Euler equations using a second-order Godunov scheme. The inviscid calculations duplicate quite well the major flow features that have been observed in the experiments of Brown and Roshko and of Oster and Wygnanski. These include the visual spreading rates and the mean-flow velocity and density profiles. This study suggests then that the mean-flow evolution is dominated by two-dimensional, inviscid effects.

24201 (CONF-8810234–, pp. 171-181) **Application of a two-equation turbulence mix model.** Crowley, W.P. (Lawrence Livermore National Lab., CA (US)). Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. A mass averaged k-epsilon model was derived by Leith using a moment expansion and appropriate closure models. Moving the mesh with the mass averaged velocity results in a Lagrangian model with constant mass in each zone. In this paper Leith's model is transformed into an "Almost Lagrangian" model by taking the mesh velocity to be the ensemble averaged fluid velocity. Here the mass in each zone may change with time. The resulting 1-D model is used to simulate the Smits and Muck supersonic wind tunnel experiment in which preexisting turbulence is amplified by a shock wave. From the model results we deduce a simplified k-ε model that is applicable to the Smits and Muck (S&M) experiment. In the analytic solution for the simplified model we find the shock thickness to be increased by a factor of 105; behind the shock the turbulent energy decays as t^{-1}.

24202 (CONF-8810234–, pp. 183-192) **A numerical study of inviscid, supersonic mixing layers.** Eberhardt, S. (Univ. of Washington, Seattle (US)); Riley, J.J.; Soetrisno, M.; Greenough, J.A. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. Contract N00014-87-K-0174. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

The purpose of this research is to understand the physical processes associated with turbulent mixing in supersonic shear layers. Specifically, the evolution of instabilities in two and three-dimensional, confined and unconfined, temporal shear layers are studied. Both linear stability theory and direct numerical simulation are used. For the two-dimensional, supersonic, confined layer, two distinct modes of instability are found, a symmetric and an asymmetric mode. In both cases the instability grows nonlinearly with large amplitude disturbances that never roll up like the classical Kelvin-Helmholtz instability. Another mode of instability is found for the confined, transonic layer where a higher mode is excited from a nonlinear interaction of the walls with the fundamental mode. The most unstable modes for the three-dimensional layer at supersonic relative Mach numbers is purely three-dimensional, i.e. oblique to the flow direction.

24203 (CONF-8810234–, pp. 193-202) **Simulation of shock and vortex interactions.** Ellzey, J.L. (Berkeley Research Associates, Springfield, VA (US)); Oran, E.S. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

Previous experimental and theoretical studies have shown that unstable subsonic shear layers evolve into a pattern of large-scale vortices which engulf fluid as they rotate in the flow field. In many cases, these large vortices break down even further due to conditions in the flow that allow new instabilities to develop. This convective mixing process is particularly important in combustors in which ignition of the premixed gases depends upon adequate mixing of the hot and cold fluids. In supersonic mixing layers, the structure of the shear layer can resemble what we see in subsonic mixing layers if the relative Mach number between the two layers is subsonic. However, the presence of shock waves may have a significant effect on the vortices and on the large-scale mixing process.

24204 (CONF-8810234–, pp. 203-216) **Mixing patterns and the generation of vorticity in a density stratified shear layer.** Ghoniem, A.F. (Massachusetts Institute of Technology, Cambridge (US)); Krishna, A. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

Numerical solutions of the unsteady inviscid, two-dimensional vorticity and mass conservation equations for an incompressible density-stratified flow in a Lagrangian, grid-free form are used to investigate the effects of vorticity generation due to baroclinicity on the development of the Kelvin-Helmholtz (K-H) instability beyond the linear range. Continuous, although sharply-decaying, density stratification is considered, and large overall density ratios are assumed. Solutions are also obtained for the corresponding linear stability problem and are used to complement the numerical solution within the initial stages of the instability. Results show that the generation of baroclinic vorticity due to the acceleration of fluid elements in a non-uniform density field imparts certain asymmetry on the structures that develop due to the K-H instability. This asymmetry is associated with the convective motion of the structure in the direction of the heavy fluid but towards the light fluid, and causes a bias in the composition of the fluid within the structure towards the light fluid.

24205 (CONF-8810234–, pp. 217-225) **Vortex shedding and merging in high-speed confined shear flows.** Kailasanath, K. (Naval Research Lab., Washington, DC (US)); Gardner, J.H.; Oran, E.S.; Boris, J.P. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

We describe a series of numerical simulations of a confined axisymmetric jet in which the inflow Mach number is varied, but the geometry and properties of the gas are held fixed. Of particular interest is how the acoustic-vortex interactions change as the inflow velocity varies from 50 to 300 m/s, corresponding to Mach numbers from 0.15 to close to one. When the velocity is increased, the natural instability frequency of the shear layer increases. If the gas properties and the geometry of the system are fixed, the acoustic frequencies remain essentially the same. Thus by varying the inflow velocity, we can examine the coupling between the acoustics and the flow instabilities. We find that when a dominant acoustic frequency is near the natural instability frequency, the shear layer first rolls up at the acoustic frequency. However, when these frequencies are very different, the shear layer rolls up at the natural instability frequency. In all cases, the acoustic frequencies strongly affect the downstream vortex mergings.

24206 (CONF-8810234–, pp. 227-236) **Extension of second-moment turbulence models in cases with large density non-uniformity.** MacInnes, J.M. (Princeton Univ., NJ (US)). Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

The paper provides an assessment of the turbulence modeling of incompressible non-reacting flows and focuses on the main physical processes associated with the density non-uniformity in such cases. Experimental evidence from plane mixing layers under various conditions is used to deduce some controlling mechanisms and to arrive at a proposed modeling to represent those mechanisms.

24207 (CONF-8810234–, pp. 237-246) **Instantaneous velocity profiles and density cross sections in supersonic shear layers.** Miles, R. Advances in compressible turbulent mixing. 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

A new method of nonintrusive diagnostics in air based on vibrational excitation of oxygen, laser-induced fluorescence and Rayleigh scattering, is applied to a supersonic axisymmetric free jet and a supersonic Mach 3 boundary layer to generate instantaneous velocity profiles and density cross sections. The velocity profiles give a quantitative measure of the velocity across the jet at any location downstream of the nozzle exit. Numerous such images are taken at several locations to generate average velocity profiles as well as turbulence intensity and axial velocity correlations across the turbulent free shear layer. Simultaneous Rayleigh scattering gives a two-dimensional cross section of the density. In the boundary layer, Rayleigh scattering is used to generate instantaneous density cross sections, two-dimensional density correlations, and probability density distribution functions of the density. This new measurement technique introduces a promising method to make quantitative comparisons with computational models.

24208 (CONF-8810234–, pp. 247-256) **Numerical simulation of the formation of vortex streets in a compressible fluid.** Munz, C.D. (Kernforschungszentrum Karlsruhe (DE)); Schmidt, L.; Schoeffel, S. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

The mechanism of the formation of vortex streets in the wake of a bluff body can be studied by considering the interaction of two infinite vortex sheets which are initially a fixed distance apart. This idea was conceived by Abernathy and Kronauer who, by this consideration succeeded in explaining essential features of the mechanism in an inviscid incompressible fluid. In this paper, we take up this idea in order to study the formation of vortex streets in a compressible fluid at different Mach numbers. This done by direct numerical simulations based on the two-dimensional compressible Navier-Stokes equations. To follow the development of the vortex sheets we combined the numerical simulation of the flow field with a marker particle algorithm At the beginning of our calculations the vortex sheets are marked by a set of particles. They are advected during the calculation in a Lagrangean fashion according to the calculated flow field. The formation of the vortex street is then visualized by graphically displaying these marker particles, similar to streaklines in experiments. While in practice flows usually develop streamwise, in our numerical calculations we assume two infinite vortex sheets which are periodically disturbed in space and the results show the development of vortex streets in time. This flow model enables us to perform large-scale computations with good resolution and the solution does not leave the computational domain.

24209 (CONF-8810234–, pp. 257-263) **Outstanding issues in the area of compressible mixing.** Papamoschou, D. (California Institute of Technology, Pasadena (US)). Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

Issues that arose from the experimental investigation of the turbulent compressible shear layer in a variable-gas, variable-Mach number facility are explored. In that investigation, the growth rates were correlated with the convective Mach number M_c, i.e., the Mach number in the frame of reference of the large-scale structure. Initially, M_c was obtained theoretically, using arguments which give it approximately the same value on the two sides of the layer. The growth rate, normalized by its incompressible value, versus M_c falls on a universal curve that decreases with M_c I Implications of that curve, as well as possible intuitive scenarios for the growth-reduction mechanism, are discussed. Recent double-exposure photos of the flow reveal that, at high compressibility, M_c has substantially different values on the two sides of the layer. Reasons for this difference between experiment and theory are suggested. The effect of the walls and the possible three-dimensionality of the flow are identified as open questions whose resolution is very important.

24210 (CONF-8810234–, pp. 265-269) **Effect of particulate additives on heat transfer from a shock-induced turbulent boundary layer.** Roberts, G.T.; East, R.A.; Pratt, N.H. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

Evidence exists that significant reductions in gun barrel wall heat flux (and heat extension of the barrel life) can be effected by adding particulate matter to the non-steady, turbulent boundary layer which develops behind the moving projectile. The mechanisms causing the heat transfer reduction are uncertain but may be related to the phenomenon, noted in incompressible turbulent boundary layer flows, where additives (either in the form of long chain molecules of length comparable to the Kolmogorov scale of turbulence in the case of water flows, or solid particulates in the case of gaseous flows) reduce the wall skin friction. In order to investigate further the heat flux reduction phenomenon, the present work was undertaken to measure the wall heat flux from a non-steady, turbulent boundary layer in a shock tube, where the freestream Mach number was supersonic and the wall was initially coated with a thin layer of talc particles of mean diameter D = 4.5ϕm.

24211 (CONF-8810234–, pp. 271-277) **Periodic slot blowing of a supersonic turbulent boundary layer.** Selig, M.S. (Princeton Univ., NJ (US)); Smits, A.J.; Fernando, E.M. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

The present investigation was initiated to help improve our understanding of unsteady shock-wave/boundary layer interactions, with the specific aim of determining the effect of the unsteady shock movement on the boundary layer turbulence. An unsteady shock-wave/boundary-layer interaction was produced on a flat plate by introducing periodic blowing through a spanwise slot in the wall at frequencies up to 5kHz. The incoming flow conditions were M_∞ - 2.84, Re_∞/l - 6.5 x 10^7, and δo - 26 mm. Measurements of the fluctuating mass flux and wall pressure were made, and the unsteady flowfield was visualized through stroboscopic schlieren videography. Since the blowing was periodic, phase-averaging could be used to identify the downstream effect of the shock oscillation. The results suggest that the main effect of the unsteady shock motion is to displace the incoming boundary layer flow without affecting the turbulence levels significantly. More interestingly, the speed of the upstream and downstream shock movement was found to be only a small fraction of the freestream velocity, and it was not strongly affected by the amount of blowing, or by the frequency of blowing.

24212 (CONF-8810234–, pp. 279-288) **Compressible, fully de-aliased, two-dimensional spectral method simulations of fluid and magneto-fluid turbulence.** Shebalin, J.V. (NASA Langley Research Center, Hampton, VA (US)); Montgomery, D. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

A fully de-aliased, two-dimensional Fourier spectral method simulation is described. This numerical method is used to study the spectral distribution of relative compressible and magnetic energy versus initial rms Mach number for decaying turbulence. Results from fluid (Navier-Stokes) simulations are compared with magneto-fluid (MHD) simulations. Future applications of the numerical procedure are also discussed.

24213 (CONF-8810234–, pp. 289-298) **Euler equation of one-dimensional compressible gas and locally-equilibrium molecular dynamics.** Sinai, Y.G. (Landau Institute of Theoretical Physics, Moscow (RU)). Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

The problem which we intend to consider in this talk can be described as the study of relations between microscopical properties of matter and their macroscopical manifestation. One of the final goals, which is still unfortunately very far from us, is to understand whether turbulent motions may be thought as collective motions of some modes having a thermodynamic origin. We shall make several speculations about this at the end of this talk. The matter which we shall deal with here is classical. It means that we neglect quantum effects. This seems to be reasonable for normal thermodynamic conditions. Another restriction which we impose is more serious. We intend to consider only one-dimensional gases but we shall take into account their properties of compression and heat conductivity. The advantage or disadvantage of the one-dimensional systems is due to the fact that the local changes of form of the infinitesimal volumes are also one-dimensional, i.e., they are reduced only to the change of the scale but not to the change of form which does not even exist in the one-dimensional situation.

24214 (CONF-8810234–, pp. 299-310) **The structure of supersonic turbulent boundary layers: What we know and what we think we know.** Smits, A.J. (Princeton Univ., NJ (US)). Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. Grant 88-0120. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

A considerable amount of turbulence data has been obtained in supersonic boundary layer flows. Virtually all data up to 1980 which could be considered "functionally complete" that is, well-documented, were compiled by Fernholz and Finley (1980), and this listing was recently brought up to date by Fernholz et al. (1988). Measurements of $\langle u' \rangle$, $\langle (\phi u)' \rangle$ and $\langle T' \rangle$ are widely available, but unfortunately measurements of $\langle v' \rangle$ and $-u'v'$ are not. Even more unfortunately, few measurements of higher order moments have been made, and spectral data, probability density distributions, and correlations have only been obtained in very few cases. In this respect, the most complete data sets for zero pressure gradient flat plate boundary layers are those by Owen and Horstman (1972), Owen, Horstman and Kussoy (1975), Robinson (1986), Fernando (1988), Spina (1988) and Smits et al. (1988). In the present contribution, we present a review of this work to assess the significance of variable density on the structure of high speed turbulent boundary layers. For the purpose of comparison with the subsonic case we use the results from Alving (1988) because of the wide variety of data obtained in that flow. The flow conditions for all cases are summarized in Table I. Not all quantities were measured by every investigator, and therefore it is not always possible to make a clear distinction between Mach and Reynolds number effects.

24215 (CONF-8810234–, pp. 311-321) **Navier-Stokes simulation of supersonic free shear layer flows.** Tang, W. (Georgia Institute of Technology, Atlanta (US)); Sankar, L.N.; Komerath, N.M. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. Contract N000-14-87-K-0132. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

The behavior of supersonic free shear layers has been analyzed through numerical solution of the 2-D compressible Navier-Stokes equations. A modified McCormack scheme that is fourth order accurate in space and second order accurate in time was used. It was found that small amplitude normal velocity disturbances introduced into the flow field grew as they were convected downstream and eventually led to organized vortical structures. The growth rate of these disturbances was found to depend on the convective Mach number. It was also found that streamwise and spanwise velocity disturbances introduced into the shear layer did not grow as rapidly as the normal velocity disturbances did.

24216 (CONF-8810234–, pp. 323-332) **Numerical simulation of enhanced mixing and turbulence in supersonic flows.** Zang, T.A. (NASA Langley Research Center, Hampton, VA (US)); Drummond, J.P.; Kumar, A. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

The fundamental issues involved in compressible turbulence are of great technological importance and present severe challenges for analytical, numerical, and empirical predictive methodologies. One pressing application is to hypersonic flight, especially for the internal flow in combustors. A principal objective is to optimize the efficiency of the fuel-air mixing occurring in the engine. In the very high speed vehicle configurations currently being considered, achieving a high combustor efficiency is particularly difficult. This is a consequence of the fact that with increasing vehicle Mach number, the average Mach number in the combustor also increases. As the combustor Mach number increases the degree of fuel-air mixing that can be achieved through natural convective and diffusive processes is reduced, leading to an overall decrease in combustion efficiency and thrust. Numerical methods for supersonic (and reacting) flow have matured to the point at which they are playing a key role in exploring mechanisms for enhancing mixing and turbulence in compressible flow. In this paper some representative illustrations of recent work directed towards mixing enhancement in supersonic combustors will be presented.

24217 (CONF-8810234–, pp. 335-340) **Measurements of turbulent, anisotropic density fluctuations in a rocket exhaust plume by a cross beam three-axis correlation technique.** Ball, G.J. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

Theoretical predictions of chemically reacting flows are sensitive to the assumptions made concerning the level of fluctuations of scalar variables such as density and temperature. There is need for experimental data to test modelling assumptions. The measurement of fluctuating density and temperature in the high temperature exhaust plume of a rocket motor poses several daunting technical problems. The use of optical non-intrusive techniques is one means of obtaining such data and this paper describes the use of the Crossed Beam Correlation method (CBC) to obtain localized measurements of the mean square density fluctuations within a rocket exhaust plume. The method uses robust, low cost optical components and is relatively insensitive to vibration and chemical contamination and requires no flow seeding.

24218 (CONF-8810234–, pp. 341-348) **Experimental observations of shock stability and shock-induced turbulence.** Benjamin, R.F. (Los Alamos National Lab., NM (US)). Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

We observe the Richtmyer-Meshkov (RM) instability of a perturbed, shock-accelerated interface between different gases. Instability growth of a singly shocked interface is observed to be consistent with previous experimental data. Late-time growth visually appears nonlinear but the growth rate remains the same as during linear growth. Re-shocking the interface produces additional RM growth and substantial profile broadening, which does not show the effect of local vorticity generation.

24219 (CONF-8810234–, pp. 349-376) **Analysis of shock-interface and shock-turbulence interactions by direct simulation and turbulence transport modeling.** Besnard, D. (Centre d'Etudes de Limeil-Valenton, Villeneuve (FR)); Haas, J.F.; Rauenzahn, R. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

We present three methods of analyzing shock-interface and shock- turbulence interaction: direct simulation, turbulence transport with a full Reynolds tensor, variable density transport model, and a newly developed "k-ε- ρ'^2", Model. Using direct simulations

performed with the 2D FCT code EAD, we discuss here the structure of the flow produced by a shock-interface interaction as well as shock-mixed region interaction, as obtained in shock-tube experiments. Boundary layer effects, a prominent feature of such experiments, are examined using the 2D ALE CAVEAT code, in which the simplified model mentioned above was implemented.

24220 (CONF-8810234–, pp. 377-386) **Numerical simulation of compressible homogeneous turbulence.** Blaisdell, G.A.; Mansour, N.N.; Reynolds, W.C. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

Direct numerical simulations of compressible decaying isotropic turbulence have been performed on a 643 grid. The simulations include a passive scalar with and without a mean scalar gradient. The balances for the equations of second order statistics are used to evaluate the effect of compressiblility on the turbulence. We find that the development of the fluctuations of density and of the dilatational portion of the velocity field are dependent on the initial conditions, and that the compressible terms in the balances vanish rapidly at the Reynolds numbers considered.

24221 (CONF-8810234–, pp. 387-396) **Turbulent jump relations in the interaction of a shock wave with a turbulent region.** Bonnet, M. (CEA/Centre d'Etudes de Limeil-Valenton, Villeneuve (FR)); Gauthier, S.; Spitz, P.; Sitt, B. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

When a shock wave crosses a turbulent region, it can be assumed that there exists an equivalent average shock front, through which average flow variables, turbulent transport fluxes and source terms undergo jumps that satisfy modified turbulent Hugoniot conditions, independently of the closure model. These relations are presented and additional kinematic jump relations are also derived, so that the Richtmyer-Meshkov turbulent source effect can be described quantitatively. With the help of the K-ϵ turbulent mixing model presented in the companion paper, the results of numerical tests of these relations performed on a classical Air-Helium shock tube computer experiment are presented and discussed.

24222 (CONF-8810234–, pp. 397-406) **Numerical simulations with a k-ϵ mixing model in the presence of shock waves.** Bonnet, M. (Centre d'Etudes de Limeil-Valenton, Villeneuve (FR)); Gauthier, S.; Spitz, P. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

Rayleigh-Taylor and Richtmeyer-Meshkov instabilities occuring in the context of inertial confinement fusion have been the object of a growing interest in the recent years. While the linear growth of small perturbations on the interface between layers of different densities is relatively well understood, the non-linear stage and the subsequent turbulent phase are poorly understood. Some insights in the non-linear growth can be done by numerical simulations as opposed to the fully developed turbulent phase where models are needed. In the context of interest, the challenge was to build a ID mixing model which had to be imbedded in a ID production hydrocode. As in the Andronov pioneering work, we used closure models which are probably the only way to work out, despite the weaknesses of such an approach. Later on, these authors also published a more sophisticated model with evolution equations for every second order quantities. In the same time, turbulent mixing models became fashionable on the West and simple models and then more elaborated models were built up. Nevertheless, it is not clear yet what informations are brought by n-equation models. However, when using closure models in unsteady situations, we are faced up to some major difficulties. The first one is the need of giving an initial turbulent state. This necessity comes from the basic assumptions where variables are splitted into a mean part and a fluctuating one. In other words, statistical models are unable to describe transition mechanisms. As a result, the final state is slightly sensitive to the initialization procedure. A second difficulty arises when simulating the interaction of turbulence with a shock wave. The numerical treatment of strong discontinuities requires a numerical dissipation in order to smear out shock waves and smooth gradients, which makes them artificially less efficient in producing turbulent kinetic energy. It follows some dependence on the spatial resolution.

24223 (CONF-8810234–, pp. 407-416) **A second-order closure for supersonic turbulent flows application to the supersonic mixing.** Dussauge, J.P. (Institut de Mecanique Statistique de la Turbulence, Marseille (FR)); Quine, C. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

The classical second-order closures are generally well adapted to the computation of supersonic flows in which non-linear effects due to compressibility are weak for moderate supersonic Mach numbers (Dussauge, Gaviglio, 1987). For higher Mach numbers, the structure of turbulence in boundary-layers seems altered (Laderman, Demetriades, 1979). The measurements involved are difficult, but some conclusions of this analysis are in agreement with the recent work of Smits et al. 1988. A good example of the effects of compressibility is given by supersonic free shear flows, which cannot be computed with low-speed turbulence models. This is probably due to the large density fluctuations produced by the high speeds. For example, a classical k-ϵ model does not reproduce the spreading rate of the supersonic free shear layer. An analysis is proposed in the present paper to take in account small departures from incompressibility caused by density fluctuations. An algebraic stress model is deduced and is used to compute free shear layers. The results are compared to measurements of mean and fluctuating quantities.

24224 (CONF-8810234–, pp. 417-425) **Evidence of Rayleigh-Taylor instabilities in tri-layer targets.** Galmiche, D. (Centre d'Etudes de Limeil-Valenton, Villenueve (FR)); Holstein, P.A.; Meyer, B.; Rostaing, M.; Wilke, N. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

In laser fusion, the Rayleigh-Taylor (RT) instability represents a major obstacle by destroying the spherical symmetry of the imploding shell, thus leading to a degradation of target performance. During implosion process, this instability may occur at the ablation layer on the outer surface, at an internal interface, or at the fuel-pusher interface during the deceleration phase. If the instability grows enough, it will buckle or break the shell and will cause fuel mix. Experiments have been carried out at Limeil on P102 laser system in order to investigate the problem of target stability under ablative acceleration and to get direct evidence of RT instability. Main experimental results are reported here. Numerical simulation have been performed with the 1-D hydrocode FCI1 coupled with a simple mixing model. We present, in the following text, part of our numerical investigations which support the occurrence of a mixed layer.

24225 (CONF-8810234–, pp. 427-436) **Shock-wave/shear layer interaction in circular supersonic jets.** Gutmark, E. (Naval Weapons Center, China Lake, CA (US)); Koshigoe, S.; Schadow, K.C. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

The interaction between shock-waves and large coherent structures in a turbulent compressible jet flow, is studied experimentally. The results are compared qualitatively with trends predicted by the linear stability theory. The techniques developed for analyzing the stability of circular jets are extended to include the shock-cell interaction with the instability waves. The controlling effect on the shear

layer evolution, of the turbulent initial conditions, the shape of initial mean velocity profile, and Reynolds and Mach numbers are investigated. The shock wave strength is varied as well as the shear layer parameters, i.e., mean and turbulent velocity distribution, thickness, etc. These parameters determine the extent of penetration of the shock into the shear layer, the compression/expansion pattern, the diffusion rate of the shocks, and the shear layer instability characteristics. A possible feedback which is generated by the sound emitted from the shock/vortices interaction locations and subsequently excites the roll-up of vortices in the shear-layer, is discussed.

24226 (CONF-8810234–, pp. 437-446) **Creation and enhancement of turbulent mixing zones due to high mach number shock-interface interaction.** Houas, L. (Universite de Provence, Marseille (FR)); Ramdani, A.; Fortes, J. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

The birth and growth of turbulent mixing of two gases having different densities after acceleration and deceleration by high Mach number shock waves are investigated in a double diaphragm shock tube. The gases are initially separated by an interface materialized by a thin plastic membrane. When a high Mach number shock wave accelerates the interface, this one is subjected to the Richtmyer-Meshkov instability. Different measurement techniques have been used and adapted to observe the created turbulent mixing zone : heat transfer gauges for the study of the incident mixing zone front, infrared absorption of a CO_2 vibrational-rotational laser line which provides temperature and density profiles in the mixing zone and infrared emission of CO_2 which gives the evolution of the mixing zone thickness. A fundamental problem appears in nuclear fusion: the creation and development of a turbulent mixing zone between the shell material and the thermonuclear combustible.

24227 (CONF-8810234–, pp. 447-456) **Preliminary data on the dynamics of turbulent shocklets.** Johnson, J.A. III (City College, New York, NY (US)); Johnson, L.E.; Zhang, J.; Zhang, Y. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

Substantial interest exists in the coherent structures produced by supersonic free shear layers. Coherent structures play an important role when nonequilibrium and nonlinear behavior is dominated by mass and momentum transfer effects. Some have argued that the mass and momentum transfer is produced by merging coherent structures. Hence, if one knows how to manipulate the structures, the entrainment can be controlled. Our work focuses on the formation and evolution of coherent structures in the supersonic free shear layer using non-obtrusive optical diagnostics. We are specifically interested here in the turbulent shocklets which are thought to be associated with these structures. We present our first preliminary data on the shocklet profile, velocity, and production frequency; we also suggest some properties of the turbulence associated with these entities. The tube wind tunnel used is an elaboration of the configuration originally proposed by Ludwieg. A conventional shock tube is modified by inserting a layer-spilling asymmetric supersonic nozzle into the section upstream from the diaphragm (the high pressure section). When the diaphragm breaks, an expansion wave moves upstream into the high pressure section through the nozzle causing the local pressure, density and gas velocity to change with time and as a function of distance from the diaphragm's location. At a time determined by the ratio of the nozzle's throat area to its exit area, the nozzle is choked, i.e., the mass flow rate is frozen, and stable supersonic flow is established in the exit region. The steady period's duration is determined by the round-trip time for the head of the expansion wave to travel from the nozzle's throat to the high pressure section's upstream end. In the literature, one can find derivations of the formulas relating the nozzles parameters to the initial conditions of the tube.

24228 (CONF-8810234–, pp. 457-472) **The interaction of a supernova remnant with interstellar clouds using high order local adaptive mesh refinement methods.** Klein, R.I. (Lawrence Livermore National Lab., CA (US)); Colella, P.; McKee, C.F. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

The interaction between supernova remnants (SNR) and interstellar clouds in the galaxy is known to play a major role in determining the structure of the interstellar medium (ISM). We know that the ISM is highly inhomogeneous, consisting of both diffuse atomic clouds ($T\sim100K$) and dense molecular clouds ($T\sim10K$) surrounded by a low density warm ionized gas ($T\sim10^4K$) and by a very hot coronal gas ($T\sim10^6K$). Next to radiation directly from stars, supernova explosions represent the most important form of energy injection into the ISM; they determine the velocity of interstellar clouds, accelerate cosmic rays, and can compress clouds to gravitational instability, possibly spawning a new generation of star formation. The shock waves from supernova remnants can compress, accelerate, disrupt and render hydrodynamically unstable interstellar clouds, thereby ejecting mass back into the intercloud medium. Thus, while the interaction of the SNR blast wave with cloud inhomogeneities can clearly alter the appearance of the ISM, the cloud inhomogeneities can similarly have a profound effect on the structure of the SNR.

24229 (CONF-8810234–, pp. 473-503) **Instability of shock-accelerated interface between two media.** Meshkov, E.E. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

Experimental results on shock tube studies of the instability of a shock-accelerated interface between two gases are presented in this review. Turbulent mixing appears after instability development when the interface is accelerated by a series of plane stationary waves. Nonlinear effects are described, which accompany the development of distortions, that are reflected and refracted at the shock wave/expansion wave interface. A local cumulation phenomenon caused by shock reflection at the perturbed interface is described.

24230 (CONF-8810234–, pp. 505-513) **Numerical simulation of turbulent mixing in shock-tube experiments.** Mikaelian, K.O. (Lawrence Livermore National Lab., CA (US)). Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

We have carried out a number of 2D numerical simulations on an ALE code for shock-tube experiments in which a shock crosses one or more contact discontinuities and, after traveling through a homogeneous medium, reflects off a rigid wall at the end of the shock-tube and re-crosses the contact discontinuity. As indicated in Fig.1 , we have considered two-fluid and three-fluid experiments: the first fluid, which carries the original shock, is air; the other fluids are helium, freon, SF_6, or air again. Helium is lighter than air, while 6 freon and SF_6 are heavier than air. The interface(s) between the fluids serve as contact discontinuities and are subjected to the original shock, the re-shock, and subsequent rarefaction/compressions. When the incoming shock has M_s=l .2, it takes a little over 1 ms and 2 ms for the re-shock in the 60 cm helium and the 30 cm freon cases, respectively. Subsequent reverberations of the shock are weaker and act to slow down the interface at later times. We have carried out numerical simulations for five types of experiments as indicated in Fig. 1. Single-scale/single-interface experiments are of the classical type considered theoretically by 2 Richtmyer and experimentally by Meshkov. Perturbations of amplitude q and wavelength λ evolve according to dn/dt = n(O)(2-π/λ)Aδv where A is the Atwood number and Δv is the jump velocity

of the interface. Perturbations grow for both positive A and negative A as considered by Richtmyer and Meshkov, respectively. Figure 2 shows the air/helium case. As expected, when A<O the amplitude goes through zero (second frame in Fig. 2) and grows with the opposite phase. The reflected shock, indicated by the arrow, sees a positive A and increases the growth rate without changing phase. To cover multiple shocks, we extended Richtmyer's formula by adding n(0) to it, so that after each shock the amplitude evolves according to (Ref. 3).

24231 (CONF-8810234–, pp. 515-524) **Computations of supersonic flows: Shears, shocks, and detonations.** Oran, E.S. (Naval Research Lab., Washington, DC (US)); Boris, J.P.; Kailasanath, K. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

This paper describes some of the basic features of and physical mechanisms controlling two types of supersonic flows: detonations and supersonic shear layers. Gas-phase detonations are supersonic flows in which a leading shock is driven through an energetic material by local energy release. The material behind the leading shock front of a detonation is highly disturbed and contains many interacting shocks, shears layers, and reaction zones that produce cell-like patterns on the chamber containing the flow. Supersonic shear layers often are extremely irregular and noisy and show strong interactions between shocks and vortical structures. This paper first discusses the roll of shocks in suppressing mixing and vortex merging in shear flows, and then discusses the effects of shock interactions on pattern formation and vorticity generation behind propagating detonations.

24232 (CONF-8810234–, pp. 525-533) **Essentially non-oscillatory shock capturing methods applied to turbulence amplification in shock wave calculations.** Osher, S. (Univ. of California, Los Angeles (US)); Shu, Chiwang. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. Grant NAG-1-270;Grant N000-14-86-K-0691;Grant DMS88-10150. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

ENO (essentially non-oscillatory) schemes can provide uniformly high order accuracy right up to discontinuities while keeping sharp, essentially non-oscillatory shock transitions. Recently we obtained an efficient implementation of ENO schemes based on fluxes and TVD Runge-Kutta time discretizations. The resulting code is very simple to program for multi-dimensions. ENO schemes are especially suitable for computing problems with Both discontinuities And fine structures in smooth regions, such as shock interaction with turbulence, for which results for one dimensional and two dimensional Euler equations are presented. We observe much better resolution by using third order ENO schemes than by using second order TVD schemes for such problems.

24233 (CONF-8810234–, pp. 535-542) **Shock-generated turbulence.** Picone, J.M. (Naval Research Lab., Washington, DC (US)); Boris, J.P. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

We review our theoretical and numerical results on the initiation of turbulence by shocks. Problems which have been addressed include turbulent cooling of laser and electric discharge channels in a gas, shock-flame interactions, and shock propagation through inhomogeneous fluids. The central issue is the identification of a nonlinear mechanism underlying the production of turbulence in an inviscid medium by flows that are initially irrotational with local density and pressure gradients aligned. The basis for our theory is the observation that vorticity is generated when the local pressure and density distributions are misaligned. The theory is nonlinear and supersedes linear treatments of shock-flame and shock-bubble interactions. In the case of hot, gaseous channels, no appropriate theory had existed beforehand. As an example, we present numerical simulations and analytic models which have given useful descriptions of evolving, hot, gaseous channels. This work has led to a successful method of suppressing turbulence in channels produced by lasers.

24234 (CONF-8810234–, pp. 543-552) **Numerical simulations of turbulent supersonic flows.** Pouquet, A. (National Center for Atmospheric Research, Boulder, CO (US)); Passot, T. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

Compressible flow calculations are reported using periodic boundary conditions, with r.m.s. Mach number of order unity. In the turbulent regime, the temporal evolution of the Mach number is mild, the flow retaining some of its compressible character for long times, with strong small-scale vortices visible in the two-dimensional case, forming in the vicinity of shocks. In the non-acoustic regime, large scales are dominated by shear motions, and small scales by shocks, with substantial inequipartition. The inertial range spectral index in dimension two for the compressible component of the velocity is close to -2, reminiscent of observations in several molecular clouds which are the site of star formation. One clear feature of three- dimensionality is the marked appearance of regions of low density.

24235 (CONF-8810234–, pp. 553-562) **Shock enhancement of a turbulent flow.** Rotman, D. (Lawrence Livermore National Lab., CA (US)). Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

Presented here are calculations describing the enhancement of turbulence caused by the passing of a shock wave. This field is of interest to those investigating the Richtmyer-Meshkov instability, supersonic combustion, fusion and many others. Experiments involving shocks and turbulence (Sturtevant, et. al. 1980, Smits and Muck 1987, Trolier and Duffy 1984) show that the turbulence level following a shock wave can be as much as 3 times higher then that before the shock. Predictions from linear theory (McKenzie and Westphal 1968 and Anyiwo and Bushnell 1982) show very similar shock enhancements. Recent calculations involving nonlinear effects (Kumar et. al. 1987 and Viecelli 1988) show promise in explaining how this enhancement is obtained. This study will use a shock tube type calculation domain to investigate the effect of a shock wave on pre-existing turbulence.

24236 (CONF-8810234–, pp. 563-570) **Nova mix experiments.** Rupert, V.C. (Lawrence Livermore National Lab., CA (US)); Kilkenny, J.D.; Skokowski, P.G. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

The NOVA mix experiments are designed to study mix between two dissimilar materials subjected to strong (M ≈50) shocks and variable accelerations in a direction normal to their common boundary. The main purpose of the experiments is to provide a data base with which predictive models can be compared and normalized. Together with shock tube experiments, which explore a different regime, the current NOVA tests investigate the shock induced source terms in our model and the evolution of both Rayleigh-Taylor stable and unstable interfaces.

24237 (CONF-8810234–, pp. 571-580) **Rayleigh Taylor instability observations of shock accelerated gases.** Stearman, N.C. (Atomic Weapons Establishment, Essex (GB)). Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

The initial aim of this work was to reproduce the work of Meshkov et al by using a shock tube of 8x2 inch cross section to produce high acceleration gradients in gases initially at atmospheric pressure and thus observe the growth of Raleigh Taylor instabilities. The work has since diversified and has to date included two interface geometries and also isolated bubble studies. In both cases the interaction of refrigerant 12 (freon), density 5.36 gm/litre, with both air, 1.2 gm/l, and helium, 0.18 gm/l, has been observed using shadowgraphy and compared with 1-D and 2-D computer simulations. Gas separation in the first case was achieved by the use of a thin membrane produced by pouring a solution of basically nitrocellulose on to a water surface and allowing the solvents to evaporate. The thickness of the resulting membrane may be ascertained from the colours reflected, (as with oil on water). Most of the membranes used reflected no colour at all indicating that the thickness is less than half a wavelength of visible light, i.e. approximately 0.2 microns. Photographs obtained from three tests of each of air/freon/air and air/freon/helium are shown. Flat topped air shocks of approximately 0./6 bar overpressure, were incident on the layer. Two dimensional numerical simulations of the situations are shown in figs 5a, b and a correspondence is clearly visible in many distinctive features.

24238 (CONF-8810234–, pp. 581-606) **Experimental research of gravitational instability and turbulization of flow at the noble gases interface.** Vasilenko, A.M.; Buryakov, O.V.; Kuropatenko, V.F.; Olkhovskaya, V.I.; Ratnikov, V.P.; Jakovlev, V.G. Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

A special type of turbulence - gravitational turbulence appears at the interface of media having different densities under nonstationary motion because of Taylor instability. This phenomenon takes place, for example, when nonstationary shockwaves pass through nonhomogeneous media. Theoretical description of the development of small interface perturbations is of no difficulty but in the process of experimental work it came out, that the growth of finite perturbations, comparable with the wave length, leads to the distortion of their initial form and complicates the analytical examination of this problem. Gravitational turbulent mixing theoretical research made by Belyenkii and Fradkin and some other authors is of semi-empirical character. In some works gravitational instability numerical research on the ground of Euler nonstationary equations with two spatial variables was carried out. Experimentally this problem is also poorly investigated. There are few works devoted to this question. The aim of this work is the experimental research of turbulization process of interface perturbations for gases having different densities under the influence of the strong decelerating shockwave under the condition of essential compressibility of initial substance. The noble gases choice was made in terms of the equality of their adiabatic compressibility. This sufficiently simplifies the experimental analysis.

24239 (CONF-8810234–, pp. 607-626) **Experimental investigation of turbulent mixing by Rayleigh-Taylor instability.** Youngs, D.L. (Atomic Weapons Establishment, Reading (GB)). Lawrence Livermore National Lab., CA (United States). 1 Jan 1992. From Workshop on the physics of compressible turbulent mixing; Princeton, NJ (United States); 24-27 Oct 1988. In *Advances in compressible turbulent mixing.* 634p. Order Number DE92014326. Source: OSTI; NTIS; INIS.

A key feature of compressible turbulent mixing is the generation of vorticity via the $\nabla p \times \nabla(1/\rho)$ term. This source of vorticity is also present in incompressible flows involving the mixing of fluids of different density, for example Rayleigh-Taylor unstable flows. This paper gives a summary of an experimental investigation of turbulent mixing at a plane boundary between two fluids, of densities ρ_1, and ρ_2. ($\rho_1 > \rho_2$) due to Rayleigh-Taylor instability. The two fluids are near incompressible and mixing occurs when an approximately constant acceleration, g, is applied normal to the interface with direction from fluid 2 to fluid 1. Full details of the experimental programme are given in a set of three reports. Some of the earlier experiments are also described by Read. Previous experimental work and much of the theoretical research has concentrated on studying the growth of the instability from a single wavelength perturbation rather than turbulent mixing. Notable exceptions are published in the Russian literature. A related process, turbulent mixing induced by the passage of shock waves though an interface between fluids of different density is described by Andronov et al. The major purpose of the experiments described here was to study the evolution of the instability from small random perturbations where it is found that large and larger structures appear as time proceeds. A novel technique was used to provide the desired acceleration. The two fluids were enclosed in a rectangular tank, the lighter fluid 2 initially resting on top of the denser fluid 1. One or more rocket motors were then used to drive the tank vertically downwards. The aim of the experimental programme is to provide data for the calibration of a turbulence model used to predict mixing in real situations.

24240 (DOE/ER/12813–T1) **Neural network approaches to tracer identification as related to PIV research.** Seeley, C.H. Jr. Texas A and M Univ., College Station, TX (United States). Dec 1992. 101p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER12813. Order Number DE93011399. Source: OSTI; NTIS; INIS; GPO Dep.

Neural networks have become very powerful tools in many fields of interest. This thesis examines the application of neural networks to another rapidly growing field flow visualization. Flow visualization research is used to experimentally determine how fluids behave and to verify computational results obtained analytically. A form of flow visualization, particle image velocimetry (PIV). determines the flow movement by tracking neutrally buoyant particles suspended in the fluid. PIV research has begun to improve rapidly with the advent of digital imagers, which can quickly digitize an image into arrays of grey levels. These grey level arrays are analyzed to determine the location of the tracer particles. Once the particles positions have been determined across multiple image frames, it is possible to track their movements, and hence, the flow of the fluid. This thesis explores the potential of several different neural networks to identify the positions of the tracer particles. Among these networks are Backpropagation, Kohonen (counter-propagation), and Cellular. Each of these algorithms were employed in their basic form, and training and testing were performed on a synthetic grey level array. Modifications were then made to them in attempts to improve the results.

24241 (DOE/ER/12813–T2) **Development and application of a high speed digital data acquisition technique to study steam bubble collapse using particle image velocimetry.** Schmidl, W.D. Texas A and M Univ., College Station, TX (United States). Aug 1992. 75p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER12813. Order Number DE93011769. Source: OSTI; NTIS; INIS; GPO Dep.

The use of a Particle Image Velocimetry (PIV) method, which uses digital cameras for data acquisition, for studying high speed fluid flows is usually limited by the digital camera's frame acquisition rate. The velocity of the fluid under study has to be limited to insure that the tracer seeds suspended in the fluid remain in the camera's focal plane for at least two consecutive images. However, the use of digital cameras for data acquisition is desirable to simplify and expedite the data analysis process. A technique was developed which will measure fluid velocities with PIV techniques using two successive digital images and two different framing rates simultaneously. The first part of the method will measure changes which occur to the flow field at the relatively slow framing rate of 53.8 ms. The second part will measure changes to the same flow field at the relatively fast framing rate of 100 to 320 μs. The effectiveness of this technique was tested by studying the collapse of steam bubbles in a subcooled tank of water, a relatively high speed phenomena. The tracer particles were recorded and velocity vectors for the fluid were obtained far from the steam bubble collapse.

24242 (DOE/ER/13641–7) **Thinning and rupture of a thin liquid film on a heated surface: Progress report, September 15, 1992–September 14, 1993.** Bankoff, S.G.; Davis, S.H. Northwestern Univ., Evanston, IL (United States). 1993. 6p. Sponsored

by USDOE, Washington, DC (United States). DOE Contract FG02-86ER13641. Order Number DE93015563. Source: OSTI; NTIS; GPO Dep.

The objective of this work continues to be the study of the dynamics, stability and rupture of thin liquid films, especially with heat and/or mass transfer. These films appear in many engineering processes, such as film coating, gas absorption, condensation, and especially cooling of hot surfaces. Surface waves may be detrimental, leading to film breakdown, with consequent equipment overheating, or beneficial, as when mass transfer coefficients are increased.

24243 (DOE/ER/13991–1) **Lattice gas hydrodynamics: Theory and simulations: Final report.** Hasslacher, B. California Univ., La Jolla, CA (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-89ER13991. Order Number DE93013537. Source: OSTI; NTIS; GPO Dep.

The first successful application of a microscopic analogy to create a skeleton cellular automaton and analyze it with statistical mechanical tools, was the work of Frisch, Hasslacher and Pomeau on the Navier-Stokes equation in two and three dimensions. This has become a very large research area with lattice gas models and methods being used for both fundamental investigations into the foundations of statistical mechanics and a large number of diverse applications. This present research was devoted to enlarging the fundamental scope of lattice gas models and proved quite successful. Since the beginning of this proposal, cellular automata have been constructed for statistical mechanical models, fluids, diffusion and shock systems in fundamental investigations. In applied areas, there are now excellent lattice gas models for complex flows through porous media, chemical reaction and combustion dynamics, multiphase flow systems, and fluid mixtures with natural boundaries. With extended cellular fluid models, one can do problems with arbitrary pairwise potentials. Recently, these have been applied to such problems as non-newtonian or polymeric liquids and a mixture of immiscible fluids passing through fractal or spongelike media in two and three dimensions. This proposal has contributed to and enlarged the scope of this work.

24244 (DOE/ER/14182–2) **Mixing of immiscible fluids in chaotic flows and related issues: Progress report, June 1, 1992–May 31, 1993.** Ottino, J.M. Northwestern Univ., Evanston, IL (United States). 30 Mar 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER14182. Order Number DE93012806. Source: OSTI; NTIS; INIS; GPO Dep.

The basis goal of this work was to obtain a basic understanding of mixing of immiscible fluids leading to the determination of flow conditions which result in efficient breakup and dispersion of one mass of fluid in the bulk of another. Related issues were the prediction of the morphological structures and drop size distribution for a given set of operating conditions. The primary motivation for these investigations was to produce basic knowledge leading to increased understanding of industrial processes involving blending, agitation, emulsification, and dissolution.

24245 (DOE/FTR–93011813) **[A trip to Germany to present four lectures on flow turbulence and combustion]: Foreign trip report, September 12–30, 1992.** Ashurst, W.T. Sandia National Labs., Albuquerque, NM (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DR00789. Order Number DE93011813. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The primary purpose of this foreign travel was to present four lectures at the Summer School given by the European Research Community on Flow Turbulence and Combustion (ERCOFTAC) located at RWTH University in Aachen, Germany. The objective of this two week Summer School was a combined lecture/workshop introduction to turbulent combustion for researchers not familiar with the topic. Of the 39 lectures, 15 were given by Professor Norbert Peters and four were given by Dr. Ashurst. A second purpose of this trip was the presentation of a seminar at the University of Grenoble, Institute of Mechanics and technical discussions with Professor M. Lesieur regarding turbulent structure.

24246 (DOE/MC/25048–3353) **Collaborative research on fluidization employing computer-aided particle tracking: Quarterly progress report No. 5, October 1, 1989–December 31, 1989.** Chen, M.M. Illinois Univ., Urbana, IL (United States). Dept. of Mechanical and Industrial Engineering. 1989. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-88MC25048. Order Number DE93013360. Source: OSTI; NTIS; GPO Dep.

The primary objective of this work was debugging and testing of the hardware and software of the transportable computer-aided particle tracking apparatus to be used at the Morgantown Energy Technology Center. Earlier effort was devoted to system interconnection and software development. While the hardware interconnections have been finished, the software development and debugging was completed in this quarter with successful initial testing. Two tracer particles were also made from 1/8th inch nylon particles, and they will be sent to METC soon.

24247 (DOE/NV/10872–T53) **Heat transfer in unsaturated, porous media.** Nevada Univ., Las Vegas, NV (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC08-90NV10872. Order Number DE93014239. Source: OSTI; NTIS; GPO Dep.

During this period, a Christiansen cell has been designed and constructed. A calibration cell has also been designed and constructed. At the present time, the optical components are being configured into the final form to perform experiments. an additional apparatus to study a related configuration is also being designed.

24248 (DOE/PC/90184–T10) **Nuclear magnetic resonance studies of granular flows: Technical progress report for the quarter ending March 31, 1993.** Lovelace Medical Foundation, Albuquerque, NM (United States). 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90184. Order Number DE93014955. Source: OSTI; NTIS; GPO Dep.

We have initiated an effort to enlarge the sample space within the magnet by designing a larger NMR probe. The new probe will be similar to the old, i.e., it will be an 8-rung, high-pass birdcage coil but with inner diameter of 5.7511 (14.6 cm) rather than the present 4.7511 (12.1 cm). If we are successful, we will push on to a yet larger diameter. The reason these redesigns are not trivial is the presence of an rf shield around the probe at a diameter of 24 cm to decouple the high power rf pulses from the shim and gradient coils that are would outside the coil. Thus, the return rf magnetic field, i.e., that part of the field that is not inside the birdcage itself, must be confined to the annular space between the shield and the coil, ultimately lowering the quality factor Q of the coil and altering the tuning. We have also derived an expression for a one-dimensional velocity profile of mustard seeds flowing in a partially filled rotating drum.

24249 (INIS-mf–13503, pp. 24-26) **A high fidelity model and code generator for the simulation of BOP systems.** Galen, S. (S3 Technologies, Columbia, Maryland (United States)); Vinay, M. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

TOPMERET represents a significant advance in the modelling fidelity of Balance of Plant systems (BOP). It is extremely flexible and can accommodate a variety of systems, including main steam, feedwater, turbine, condenser, offgas, large volumes, such as the containment, and water systems such as service water. It handles both normal and abnormal operating scenarios, including pipe break accidents. It was tested successfully on various simulators, and meets the fidelity required of BOP system models so as to successfully integrate with the high level of control automation of European designs. (Z.S.) 1 ref.

24250 (LBL–32529) **The method of Laplace Transform MultiQuadrics (LTMQ) for the solution of the groundwater flow equation.** Moridis, G.J. (Lawrence Berkeley Lab., CA (United

States)); Kansa, E. Lawrence Berkeley Lab., CA (United States). Jun 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9306153–1: 7. International Association for Mathematical and Computers in Simulation (IMACS) conference on computer methods for partial differential equations, New Brunswick, NJ (United States), 22-24 Jun 1993). Order Number DE93010408. Source: OSTI; NTIS; GPO Dep.

This paper presents a new numerical method, the Laplace Transform MultiQuadrics (LTMQ) method, developed for the solution of the diffusion-type parabolic Partial Differential Equation (PDE) of fluid flow through porous media. LTMQ combines a Multi-Quadrics (MQ) approximation scheme with a Laplace transform formulation. The use of MQ in the spatial approximations allows the accurate description of problems in complex porous media with a very limited number of nodes. The Laplace transform formulation eliminates the need for time discretization, thus allowing an unlimited time step size without any loss of accuracy. LTMQ is tested against results from three test problems of groundwater flow obtained from a standard Finite Difference (FD) model, as well as from analytical solutions. An excellent agreement between the LTMQ and the analytical and FD solutions is observed, while significant reductions in computer execution times may be achieved.

24251 (NAL-TM–648T) **Numerical wind tunnel project computational fluid dynamics at National Aerospace Laboratory, Japan.** Hirose, N. (National Aerospace Laboratory, Tokyo (Japan)). National Aerospace Lab., Chofu, Tokyo (Japan). Jul 1992. 11p. Order Number DE93793615. Source: OSTI; NTIS; Available from National Aerospace Laboratory, 44-1, Shindaiji Higashicho 7-chome, Chofu-City, Tokyo, Japan.

The progress report of the numerical wind tunnel project and computational fluid dynamics (CFD) at National Aerospace Laboratory (NAL), Japan, presented to the 3rd ISNaS symposium opened in Netherlands in Sep. 1991. The history of the NAL's computer system from 1960 to 1991, and the present numerical simulation facility mainly composed of FACOM supercomputers are outlined together with graphics terminals connected with host computers through LAN. The progress of the feasibility study of the numerical wind tunnel project released in 1989 is also outlined. On CFD researches at NAL, the studies of FEM grid generation methods, Euler/Navier-Stokes equation codes and turbulence models are presented. On applications to the national aerospace projects, those to the developmental projects of YXX, ASKA and SST, and the aerodynamic simulation results of the space vehicle HOPE are outlined as well as the future projects. 3 refs., 5 figs., 4 tabs.

24252 (NAL-TR–1156) **Simulated wake characteristics of tapered annular wings by a discrete vortex method.** Okuyama, M. (National Aerospace Laboratory, Tokyo (Japan)); Makino, M. National Aerospace Lab., Chofu, Tokyo (Japan). May 1992. 15p. (In Japanese). Order Number DE93793620. Source: OSTI; NTIS; Available from National Aerospace Laboratory, 44-1, Shindaiji Higashicho 7-chome, Chofu-City, Tokyo, Japan.

With an objective to discuss wake vortex roll-in as a wake characteristic of tapered annular wings, numerical simulation was performed on wakes of wings with two different shapes using a discrete vortex method, and a wake observation was made on a plate type model using a smoke wind tunnel. The test specimens are box-type wings and rectangular wings with the same aspect ratio of 2 as in the annular wings. The simulation provided the following results: A process for a vortex layer in the tapered annular wing to get rolled in to turn into a wake swirl consumes more time than in the case with generally used wings; and a tapered annular wing differs from a non-tapered wing in that a vortex layer in the vicinity of the upper center part remains in the upper part after the roll-in process. Wake observations with a simulation and smoke were compared. A pathline on the wing center seen in the smoke observation tended to be indicated longer. A pathline in the vicinity of the wind tunnel wall did not agree with the simulation result. This should have been because wall interference has occurred. However, both agreed with each other in the wake of a potential flow zone. 8 refs., 14 figs.

24253 (NAL-TR–1157) **Simulated and experimental aerodynamic characteristics of tapered annular wings.** Okuyama, M. (National Aerospace Laboratory, Tokyo (Japan)); Makino, M. National Aerospace Lab., Chofu, Tokyo (Japan). May 1992. 32p. (In Japanese). Order Number DE93793621. Source: OSTI; NTIS; Available from National Aerospace Laboratory, 44-1, Shindaiji Higashicho 7-chome, Chofu-City, Tokyo, Japan.

With an objective of identifying aerodynamic characteristics of tapered annular wings, the equations of the quasi-vortex lattice method for planer wings were extended to those that can be applied to the tapered annular wings, and the longitudinal aerodynamic characteristics were calculated using numerical calculations according to the above equations. To compare the results with measurements, a wind tunnel experiment was carried out using two kinds of models. The numerical calculations provided data for effects of the number of binding vortex and the number of one wing division in the wing width direction on the convergence of lift curve slope and induced drag, and relationship between the calculation result and Mach numbers. Six-component measurements provided the longitudinal aerodynamic characteristics. The comparison revealed the following: These calculations can infer approximately the experimental data on such longitudinal aerodynamic characteristics as the lift coefficients and pitching moment coefficients other than the induced drag. Lateral aerodynamic characteristics were obtained from a wind tunnel experiment on a model made of boards. This experiment achieved a result that the lateral inclination of the model with a taper ratio of 0.15 is smaller by 20% than that for a model with a taper ratio of one. 7 refs., 26 figs., 1 tab.

24254 (NAL-TR–1172) **New aerodynamic information obtained from the solution of the inverse problem for aerofoils.** Shigemi, M. (National Aerospace Laboratory, Tokyo (Japan)). National Aerospace Lab., Chofu, Tokyo (Japan). Jul 1992. 12p. (In Japanese). Order Number DE93793625. Source: OSTI; NTIS; Available from National Aerospace Laboratory, 44-1, Shindaiji Higashicho 7-chome, Chofu-City, Tokyo, Japan.

An inverse problem was solved from a pressure distribution around an aerofoil as derived from an experiment to seek an aerofoil shape that realizes the pressure distribution. Flows given on a boundary layer were solved using the inverse problem varying such parameters as the aerofoil elevation angles and the flow Reynolds number. In the present work, a method was used that a Laplace equation is solved that is a governing equation hypothesizing a flow without vortices (solution of a forward problem) to derive an object shape that realizes the very flow. The following findings were obtained: This method is effective for the case with a low Reynolds number, and can obtain an aerofoil with high accuracy upon less repetition of calculations; no convergence solution can be derived when the Reynolds number is high; a method to express displacement effect of the boundary layer by adding a displacement thickness of the boundary layer to the original aerofoil thickness is thought to have a practical reasonability; change in the pressure distribution occurs from local change in curvature of the aerofoil face; and with a flow flowing along a flat plate, a correction amount of the surface coordinates is equal to the displacement thickness. This can be introduced mathematically. 9 refs., 15 figs.

24255 (SAND–92-0480) **Downstream evolution of turbulence from heated screens: Experimental and analytical results.** O'Hern, T.J.; Shagam, R.N.; Neal, D.R.; Suo-Anttila, A.J.; Torczynski, J.R. Sandia National Labs., Albuquerque, NM (United States). Feb 1993. 111p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012396. Source: OSTI; NTIS; GPO Dep.

This report discusses recent efforts to characterize the flow and density nonuniformities downstream of heated screens placed in a uniform flow. The Heated Screen Test Facility (HSTF) at Sandia National Laboratories and the Lockheed Palo Alto Flow Channel (LPAFC) were used to perform experiments over wide ranges of upstream velocities and heating rates. Screens of various mesh configurations were examined, including multiple screens sequentially positioned in the flow direction. Diagnostics in these experiments included pressure manometry, hot-wire anemometry, interferometry, Hartmann wavefront slope sensing, and photorefractive schlieren photography. A model was developed to describe the downstream evolution of the flow and density nonuniformities. Equations for the spatial variation of the mean flow quantities and

the fluctuation magnitudes were derived by incorporating empirical correlations into the equations of motion. Numerical solutions of these equations are in fair agreement with previous and current experimental results.

Magnetic powder flaws are detected on sites by visually determining formed defect indicating patterns. This paper discusses a method to extract defects through an image processing to show them clearly on a screen and evaluate them quantitatively with an objective to improve the detection reliability. Used for a test was a test piece with line-like defects clad by welding on billets and grooves on which surface defects exist. A test piece slanted at 30 degrees to a plane was magnetized, on which an inspection liquid containing fluorescent magnetic powder with grain sizes from 5μm to 20μm was sprinkled using an Eulerian method. A reflected light obtained by irradiating ultraviolet rays on the test piece was taken into a CCD camera. The image data were digitized so that an image displayed on a screen is formed with 256×240 picture elements to show the picture elements with concentration values in 256 levels. As a result of giving such devices as making noises into binary values using a template to distinguish them according to surface irregularities, labelling the coupled components, and classifying the shapes, the resultant images were verified to have extracted nearly only the defects intended to be detected. 3 refs., 9 figs.

24257 (DOE/CE/40777–9) **On-machine sensors to measure paper mechanical properties.** Hall, M.; Brodeur, P.; Lorenz, K.; Jackson, T. Institute of Paper Science and Technology, Atlanta, GA (United States). [1990]. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-86CE40777. (CONF-9011322–1: Advanced sensors technical conference, Atlanta, GA (United States), 12-13 Nov 1990). Order Number DE93010635. Source: OSTI; NTIS; GPO Dep.

The objective of this research is to develop sensors capable of measuring the velocity of ultrasound in the thickness and in-plane directions of paper while the paper is moving at line speed on the paper machine. It is furthermore desired to determine the response of sensors and data collection system to moving paper webs prepared with selected parameter changes.

24258 (INIS-mf–13503, pp. 56-59) **Efficient and reliable inspection through the use of optimised NDT.** Highmore, P.J. (AEA Technology, Warrington (United Kingdom)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

Current activities within AEA Technology are described aiming at the constitution of an optimized and reliable inspection technology for the UK nuclear programme. Three main factors, i.e. optimized inspection design, efficient inspection reliability assessment and effective inspector training, influencing the efficiency and reliability of the on-site inspection are discussed. (Z.S.).

24259 (INIS-mf–13503, pp. 85-88) **Automatic eddy current inspection system.** Saariaho, P. (Imatran Voima Oy (IVO), Helsinki (Finland)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

A description is given of a system developed by IVO for the industry standard PC to analyze eddy current signals in real time during inspection. It is based on phase angle analysis of eddy current signals which is the only possible technique to determine depths of small corrosion defects accurately. With the automated eddy current method about 500 condenser tubes can be inspected in one shift. The operation environment is an IBM PC compatible computer and graphics user interface of Microsoft Windows. (Z.S.) 4 figs.

24260 (INIS-mf–13503, pp. 89-95) **Erosion-corrosion prediction and inspection program for Krsko NPP.** Vermaut, M. (Westinghouse Energy Systems International, Brussels (Belgium)); Baltus, R.; Roarty, D.H.; Pete, D. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

Pipe wall thinning through erosion-corrosion (E/C) is a problem receiving much attention in the nuclear and non-nuclear industry, and is also involved in the Krsko nuclear power plant. In 1991, the Krsko plant decided to upgrade its inspection programme and acquired computerized systems for thickness data acquisition, management and evaluation. The Krsko plant and Westinghouse performed a systematic E/C prediction analysis for all carbon-steel high-energy piping, using the state-of-the-art computer model using the EPRI (Electric Power Research Institute) code CHECKMATE. The E/C predictions and the results of past inspections were combined to redefine a new inspection plan starting with the spring 1992 outage. The first phase of the project is described including computer modelling and the inspection plan prepared for the upcoming outage. (Z.S.) 1 tab., 4 figs., 3 refs.

24261 (SAND–92-2297C) **Experimental technique to launch flier-plates representing orbital debris to hypervelocities.** Chhabildas, L.C.; Boslough, M.B. Sandia National Labs., Albuquerque, NM (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930445–9: Society of Photo-Optical Instrumentation Engineers (SPIE) OE/aerospace science and sensing meeting, Orlando, FL (United States), 11-16 Apr 1993). Order Number DE93012838. Source: OSTI; NTIS; GPO Dep.

Very high driving pressures (tens or hundreds of GPa), are required to accelerate flier plates to hypervelocities. This loading pressure pulse on the flier plates must be nearly shockless to prevent the plate from melting or vaporizing. This is accomplished by using graded-density impactors referred to as "pillows." When this graded-density material is used to impact a flier-plate in a modified two-stage light gas gun, nearly shockless megabar pressures are introduced into the flier plate. The pressure pulses must also be tailored to prevent spallation of the flier-plate. This technique has been used to launch nominally 1-mm-thick aluminum, magnesium and titanium (gram-size) intact plates to 10.4 km/s, and 0.5-mm-thick aluminum and titanium (half-gram size) intact plates to 12.2 km/s. This is the highest mass-velocity capability attained with laboratory launchers to date, and should open up new regimes of impact physics and lethality studies related to space sciences for laboratory investigations. In particular, the mass-velocity capability of this newly developed hypervelocity launcher meets the average specifications of the space debris environment, and is therefore expected to be a useful tool to evaluate the effects of debris impact on space structures and debris shields.

24262 (UCRL-ID–111488) **Permanent magnet radiation hardness tests at the 100 MeV Linac: Preliminary results.** Kulke, B.; Palomar, J. Lawrence Livermore National Lab., CA (United States). Sep 1992. 16p. Sponsored by Department of

Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93012999. Source: OSTI; NTIS; GPO Dep.

During a five-day run at the 100 MeV Linac, we exposed 21 permanent magnet samples from four different manufacturers to 1-2 gigarad doses of 85 MeV gamma radiation, plus some direct electron radiation. Only the Sm-Co samples survived without change, while the Ne-Fe-B samples lost 1-5 percent of their initial magnetization. The loss in remanence was most extreme for three Pr-Fe-B samples (up to 75 percent loss).

24263 (UCRL-JC–106122) **Impulse gain and damage from very high dynamic loading using flyer impact.** Osher, J.; Chau, H.; Gerassimenko, M.; Lee, R.; Pomykal, G.; Terhune, R.; Weingart, R. Lawrence Livermore National Lab., CA (United States). Jul 1991. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-911069–11: 3. international conference on mechanical and physical behavior of materials under dynamic loading, Strasbourg (France), 14-18 Oct 1991). Order Number DE93011957. Source: OSTI; NTIS; GPO Dep.

The Lawrence Livermore National Laboratory (LLNL) 1 MJ and 87 kJ electric guns are in use for a variety of shock-wave applications using the hypervelocity impact of dielectric (or dielectric and metal composite) flyer plates on material samples. The 1 MJ electric gun is a newly completed facility and will be described. The specific applications discussed here include a study of momentum gain and spat damage produced by Kapton flyer impact on aluminium 6061-T6. The experimental impact measurements are used to calibrate code calculations that can be applied under more general hypervelocity impact conditions to typical relative orbital velocities near 10 km/s. The analytical results of code calculations supporting these study areas are also reported.

24264 (CONF-9207203–, pp. 22-26) **Study of CO2 recovery on P.F ombustion with oxygen/flue gas recycle.** Miyamae, S. (Ishikawajima-Harima Heavy Industries, Co. Ltd., Tokyo (Japan)); Noguchi, Y.; Maeda, U.; Tanaka, T. 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Applicability was studied of pulverized coal fueling combustion system with wet oxygen/flue gas recycling (where the oxygen is 97.5% in purity) by taking a 1000MW facilities as an object for the CO2 recovery type power generation system. In the separation and recovery of CO2 by the conventional pulverized coal/air combustion system, the CO2 is separated by the chemical absorption or physical adsorption which follows the dedusting and desulfurization, and then recovered. Inlet gas into the separation/recovery unit must be controlled in quantity of sooty dust and concentration of both SOx and NOx in order to avoid degradation and poisoning of absorbent and adsorbent. The new present system, though additionally needing an oxygen production process, is as high as 95% in CO2 concentration in the flue gas so that the recovery can be made without separation which is no longer necessary. Therefore, the flue gas treatment facilities can be considerably simplified so that reduction can be made in both installation cost and necessary power in the station. NOx is also considerably controlled. As compared with 39.1% in power sending end efficiency of the conventional air combustion system without CO2 recovery, the present system is as low as 30.9% in it because of CO2 recovery but excels the conventional amine absorption system which is 27.8% in it. The annual increase in total expenses inclusive of both installation and operation costs for the CO2 recovery in the present system is smaller than that in the amine absorption system. 4 refs., 1 fig., 2 tabs.

24265 (CONF-9207203–, pp. 55-58) **Present status and future aspects of combustion technologies to establish the advanced utilization of thermal energy.** Otake, K. (Toyohashi University of Technology, Aichi (Japan)). 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Combustion technologies were studied for the high degree utilization of thermal energy. Energy systems being presently used are of a type which stands alone and most of them are low in utilization efficiency. The water heating, air conditioning, cooking, etc. use 20 to 25% of the fossil fuel in the form of high temperature combustion heat which is released as waste heat after utilized. The transportation uses 16% of all the primary energy however mostly through the internal combustion engines which are low in thermal efficiency. Problem is also about their exhaust gas. The power generation uses 42% of all the primary energy (32% by fossil fuel, 9% by nuclear energy and 1% by others). Their efficiency which is 48% even by combined cycle must be designed to be higher than 80% by cogeneration, etc. The use of fuel cell is also promising. It is also important to recycle the waste as energy to be reused. Based on a new concept upon thorough review of the present material and energy systems, development must be spread out of combustion technologies which contribute to the high degree utilization of thermal energy and environmental purification.

24266 (CONF-9207203–, pp. 59-64) **Combustion technology in industrial furnaces.** Suzuki, T. (Kobe Steel, Ltd., Kobe (Japan)). 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

Combustion by industrial furnaces produces carbon dioxide which quantitatively occupies 33% of that produced in all over Japan. Study was made of carbon dioxide control with saving the energy. Because the exhaust heat recovery by heat exchanger needed an expensive and large installation, design was made of a compact unit, to the burner body of which a heat exchanging function was given. In the heat recuperative burner, heat exchange is done between the combustion use air and exhaust combustion gas which is made to flow in an annular passage around the burner. Thus, more than 30% of fuel can be economized. Provided with a heat regenerator, the heat regenerative burner continues combustion by reciprocally switching the ventilation and gas exhaust. There exists The one which is as high as 48% in fuel economizing ratio. In the thermal treatment of steel by the direct fire reduction heating furnace, reduction is done by flame in a non-equilibrated region where the air ratio is 0.8 to 0.9. As compared with that by the conventional radiant tube type furnace, the above treatment is improved in both thermal respondency and plate's adoption time, and saves the energy. The system which blows pulverized coal, in lieu of coke, from a lower tuyere of blast furnace does not need coke oven, economizes the carbonization heat and quantitatively reduces the carbon dioxide. The above system is introduced to 80% of the blast furnaces presently under operation in Japan. 16 refs., 14 figs.

24267 (DOE/FTR–93013557) **[Travel to Lisbon, Portugal to present a paper at the sixth international symposium of applications of laser techniques to fluid mechanics and travel to Cambridge University to visit the Shell Thornton Research Centre]: Foreign trip report, July 18–29, 1992.** Witze, P.O. Sandia National Labs., Livermore, CA (United States). 28 Aug 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DR00789. Order Number DE93013557. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The author's paper presented at this symposium related to homogeneous- charge combustion in a spark ignition engine. Although most of the other papers were related to techniques and applications of laser Doppler velocimetry and phase-Doppler particle analyzers, there were four sessions on particle image velocimetry and two sessions on scalar measurements. In the topical areas there were two combustion sessions, two reciprocating engine sessions, and one session on sprays. The manufacturer's display at the symposium continued to grow. A secondary purpose of the trip was to visit the engine research facilities of the Shell

Thornton Research Centre, Leeds University, Loughborough University of Technology, and Cambridge University.

24268 (EGG-M–92069) **Post combustion trials at Dofasco's KOBM furnace.** Farrand, B.L.; Wood, J.E.; Goetz, F.J. Dofasco, Inc., Hamilton, ON (Canada). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9204236–1: 75. ISS-AIME steelmaking conference, Toronto (Canada), 5-8 Apr 1992). Order Number DE93010804. Source: OSTI; NTIS; GPO Dep.

Post combustion trials were conducted at Dofasco's 300 tonne KOBM furnace as part of the AISI Direct Steelmaking Program. The purpose of the project work was to measure the post combustion ratio (PCR) and heat transfer efficiency (HTE) of the post combustion reaction in a full size steelmaking vessel. A method of calculating PCR and HTE using off gas analysis and gas temperature was developed. The PCR and HTE were determined under normal operating conditions. Trials assessed the effect of lance height, vessel volume, foaming slag and pellet additions on PCR and HTE.

24269 **Downhole material injector for lost circulation control.** Glowka, D.A. To Dept. of Energy. 1991. Filed date 17 Apr 1991. USA patent application 7-686,442. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012018. Source: OSTI; NTIS; GPO Dep.

This invention is comprised of an apparatus and method for simultaneously and separately emplacing two streams of different materials through a drillstring in a borehole to a downhole location for lost circulation control. The two streams are mixed outside the drillstring at the desired downhole location and harden only after mixing for control of a lost circulation zone.

24270 (AUC-IBT-R–9240) **Optimal inspection strategies for offshore structural systems.** Structural Reliability Theory Paper, 96. Faber, M.H.; Soerensen, J.D.; Kroon, I.B. Aalborg Universitetscenter (Denmark). Inst. for Bygningsteknik. Dec 1992. 16p. (CONF-9209358–1: OMAE'92 conference, Calgary (Canada), Sep 1992). Order Number DE93794732. Source: OSTI; NTIS.

Optimal planning of inspection and maintenance strategies for structures has become a subject of increasing interest especially for offshore structures for which large costs are associated with structural failure, inspections and repairs. During the last five years a methodology has been formulated to perform optimal inspection and repair strategies for structural components subject to incertain loading conditions and material behavior. This methodology makes it possible to determine an inspection and repair plan which will minimize the total expected costs of a component throughout its anticipated lifetime. The expected costs are calculated as the product of the probability of the event (e.g. repair) and the cost of the event. Only recently the authors have extended this methodology to include also system failure i.e. failure of a given sub set of all the structural components. This extension includes first of all a mathematical framework for the estimation of the failure and repair costs associated with systems failure but also and not least a strategy for selecting the components to inspect. The present paper is concerned about the application of this extended methodology in the case of offshore structures. First a detailed description of the method is presented and thereafter special interest is paid to the problem of selecting structural components to inspect. Methods and analysis schemes are illustrated by an example. (au) (15 refs.).

24271 (AUC-IBT-R–9241) **Reliability analysis of an offshore structure: A case study - 1.** Structural Reliability Theory Paper, 97. Faber, M.H. (University of Aalborg, Aalborg (Denmark)); Soerensen, J.D.; Rackwitz, R.; Thoft-Christensen, P.; Bryla, P. Aalborg Universitetscenter (Denmark). Inst. for Bygningsteknik. Dec 1992. 16p. (CONF-9209358–2: OMAE'92 conference, Calgary (Canada), Sep 1992). Order Number DE93794733. Source: OSTI; NTIS.

A jacket type offshore structure from the North Sea is considered. The time variant reliability is estimated for failure defined as brittle fracture and crack through the tubular member walls. The stochastic modelling is described. The hot spot stress spectral moments as function of the stochastic variables are described using spline function response surfaces. A Laplace integral expansion is used to estimate the time variant reliability. Parameter studies are performed for the reliability estimates and the results of the time variant and the time invariant reliability analyses are compared. (au).

24272 (AUC-IBT-R–9242) **Reliability analysis of an offshore structure: A case study - 2.** Structural Reliability Theory Paper, 98. Soerensen, J.D. (University of Aalborg, Aalborg (Denmark)); Faber, M.H.; Rackwitz, R.; Thoft-Christensen, P.; Lebas, G. Aalborg Universitetscenter (Denmark). Inst. for Bygningsteknik. Dec 1992. 15p. (CONF-9209358–: OMAE'92 conference, Calgary (Canada), Sep 1992). Order Number DE93794734. Source: OSTI; NTIS.

For an offshore structure in the North Sea it is assumed that information from measurements and inspections is available. As illustrations measurements of the significant wave height and the marine growth and different inspection and repair results are considered. It is shown how the reliability estimates of the structure can be updated using Bayesian techniques. By minimizing the total expected costs including inspection, repair and failure costs during the lifetime an optimal inspection and repair strategy can be determined. The decision variables are the number of inspections, the time intervals between inspections and the inspection qualities. A parameter study is performed and an updated inspection plan is determined after the first inspection has taken place. (au) (12 refs.).

24273 (CONF-921276–, pp. 203-206) **Development of automatic observation system for oceanographic and meteological data powered by solar and wave energy for Oki-no-Torishima Island.** Washio, Y. (Japan Marine Science and Technology Center, Kanagawa (Japan)); Miyazaki, T. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

This paper describes development of automatic observation devices of self energy supply type for maintenance-free and unattended oceanographic observation at Oki-no-Torishima Island. All power for the devices is supplied from a battery. While a charging system charges the battery continuously, a 12V-battery with a capacity of 80 Ah was selected that can supply power for a two-week operation assuming a possible failure. Small wave force power generators and solar cells were adopted for the charging system from the viewpoint of smallness in the scale, little failure factors, and easiness of installation. The wave force power generation used a vibration column type air turbine generator and a wells turbine direct connection generator. The solar cells have an output capacity of 80W, given with consideration on water resistance and durability. The wave force power generator has been operating without a trouble for two years since 1989 except for rusting in the air chambers. However, wave heights were reduced largely because of the surrounding reefs, making the power generation system unsuitable in terms of the cost. The solar cell system has been operating under sufficient insolation for charging the battery, with the light receiving face kept uncontaminated. The system reasonability was verified as in the wave force power generation as far as the design and installation methods are concerned. 9 refs., 8 figs.

Particular technologies, like soft X-ray beams generation by laser-matter interaction for X-ray lithography or biological X-ray diagnostics, require laser beams having a very high intensity ($>10^{10}$ W-cm^2) and possibly a short wavelength (for higher radiation-to-matter matching). For such purposes, excimer lasers are the best candidates since they represent the highest powerful coherent sources in the U.V. range. In spite of their short pulse duration (10^{-8}-/10^{-7} s), they provide a very high gain of the active medium and consequently unstable resonators, characterized by fast transverse modes selection with high losses, can be applied. Here a high magnification (M=7) Positive Branch Unstable Resonator (PBUR) has been successfully applied to a wide aperture (10x10 cm^2) XeCl laser, leading to a laser beam divergence of 14 prad PWEM (3 times the diffraction limit) and a brightness of about 10^{15} W-(cm^2 srad). The experimental results are investigated by means of analytical considerations and a numerical simulation. This paper describes first the guide-lines for the choice of the resonator, then the experimental results and finally the simulation code.

24276 (ENEA-RT-INN–92-04, pp. 5-14) **Theoretical study of prepulse-main discharge XeCl lasers.** Letardi, T.; Fang, H.; Flora, F.; Fu, S. ENEA, Frascati (Italy). Dipt. Sviluppo Tecnologie di Punta. Apr 1992. (CONF-911296–: 14. international conference on laser and applications, San Diego, CA (United States), 8-13 Dec 1991). In *Contributions to 14th international conference on laser and applications: (San Diego, CA, 8-13/12/1991).* 22p. Order Number DE93000814. Source: OSTI; NTIS (US Sales Only); INIS.

To achieve high energy deposition efficiency of discharge pumped XeCl lasers, the energy storage capacitor should be charged to a voltage about two times of the self-sustained voltage of the laser system. Unfortunately, this voltage is too low to initiate a uniform glow discharge. To speed up the avalanche process, prepulse-main discharge technique was proposed in which, a high voltage breakdown pulse and a sustaining pulse are provided by separate circuits. In this paper, the discharge characteristics of prepulse-main discharge XeCl lasers and the effects of prepulse circuit parameters are investigated by means of a kinetic code. The modeling shows that an appropriately designed prepulse circuit could speed up the breakdown process effectively. The key point for this technique is to design a prepulse circuit which multiplies the electron density from its initial value to about 10^{14}-cm^3 in a reasonable short time during which the main discharge circuit is disconnected from the electrodes. Optimum values of capacitance, charge voltage of the prepulse circuit, delay time between prepulse and main discharge for energy deposition efficiency, XeCl formation efficiency and laser performance are also investigated.

24277 (GA-A–21236) **User's manual for the DAD-1 data acquisition daughter board for the SuperCard-2.** Ferron, J.R. General Atomics, San Diego, CA (United States). May 1993. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. Order Number DE93012153. Source: OSTI; NTIS; GPO Dep.

A detailed description of how to use the DAD-1 data acquisition daughter board is given. The DAD-1 daughter board is used with the SuperCard-2, a VME format processor board manufactured by CSP Inc. that is based on the Intel i860 microprocessor. The daughter board provides high speed acquisition of digital data through a general purpose input port. Data are transferred through direct memory access operations to the memory on the SuperCard-2 board at a rate up to 40 million, 14 bit samples per second. A first-in, first-out memory is used to buffer the data during the transfer. Several different data acquisition operating modes are available that make a combination of a SuperCard-2 processor board and a DAD-1 daughter board suitable for a wide range of real time data analysis and feedback control functions.

24278 (LA-SUB–93-168) **Metal oxide varistor feasibility study.** Levinson, L.M. (General Electric Co., Schenectady, NY (United States). Corporate Research and Development Dept.); Comanzo, H.A. Los Alamos National Lab., NM (United States); General Electric Co., Schenectady, NY (United States). Corporate Research and Development Dept. [1993]. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93012921. Source: OSTI; NTIS; GPO Dep.

We have successfully fabricated varistor material meeting the initial voltage stabilization specifications for the Dual Axis Radiographic Hydratest (DARHT) facility. A time dependent voltage droop ("overshoot") has been identified as a potential issue and some promising avenues to reduce the overshoot are outlined. In particular, preliminary tests using series capacitance gives an overshoot of a few percent. These data, coupled with our previous experience on low-overshoot varistor formulations, lead to the conclusion that specially tailored varistor material might be suitable for the DARHT application.

24279 Cavity resonance absorption in ultra-high bandwidth CRT deflection structure. Dunham, M.E.; Hudson, C.L. To Dept. of Energy. 15 May 1991. USA patent application 7-700,286. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-88NV10617. Order Number DE93012002. Source: OSTI; NTIS; GPO Dep.

An improved ultra-high bandwidth helical coil deflection structure for a cathode ray tube is described comprising a first metal member having a bore therein, the metal walls of which form a first ground plane; a second metal member coaxially mounted in the bore of the first metal member and forming a second ground plane; a helical deflection coil coaxially mounted within the bore between the two ground planes; and a resistive load disposed in one end of the bore and electrically connected to the first and second ground planes, the resistive load having an impedance substantially equal to the characteristic impedance of the coaxial line formed by the two coaxial ground planes to inhibit cavity resonance in the structure within the ultra-high bandwidth of operation. Preferably, the resistive load comprises a carbon film on a surface of an end plug in one end of the bore.

24280 Ring regenerative laser amplifier. Perry, M.D.; Patterson, F.G. To Dept. of Energy. 1991. Filed date 22 May 1991. USA patent application 7-704,590. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93011997. Source: OSTI; NTIS; GPO Dep.

This invention consists of an efficient, high gain, compact regenerative amplifier that amplifies a seed pulse of laser energy to produce an amplified pulse of greater energy. The amplifier is useful for amplifying seed pulses having a broad bandwidth or in situations where tunability is necessary. The amplifier has high gain while maintaining high pulse contrast. A seed pulse can be amplified to the saturation fluence while maintaining a high contrast ($>10^3$). The regenerative amplifier has an optical cavity in a ring configuration, a gain material positioned in the cavity, a polarization-rotating element positioned in the cavity to rotate the polarization of the pulse upon each pass around the cavity, means for inserting the seed pulse into the cavity, and means for removing the polarization-rotated, amplified pulse from the cavity. In some embodiments, the seed pulse is switched in passively, by a selective polarization, and is switched out after a predetermined number of passes around the ring cavity. This completely passive arrangement avoids possibility of switchout failure, and minimizes the ASE problem. In other embodiments, a selectively actuable switch, such as electro-optic element, may be provided within the

ring cavity, to switch-in the seed pulse and switch-out the amplified pulse. The electro-optic element may be actuated with a square wave that has a peak voltage equal to the half-wave voltage of the electro-optic crystal.

24281 (SAND–92-2804C) **High power z pinches as x-ray laser photopumps.** Nash, T.J.; Spielman, R.B.; Ruggles, L.; Vargas, M. Sandia National Labs., Albuquerque, NM (United States). [1992]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9304126–6: 3. international conference on dense z-pinches, London (United Kingdom), 19-23 Apr 1993). Order Number DE93012842. Source: OSTI; NTIS; GPO Dep.

Using Saturn as a driver, we are pursuing both photoresonantly pumped and photoionization/recombination lasers. Our lasing targets are gas cells with thin windows that are pumped by a z pinch 2 cm away radiating 10 TW. In both schemes the lasant and gas fill is neon. To increase our chances of measuring the resonantly photopumped lasing transition we have introduced potassium into a sodium z pinch and have eliminated oxygen from the gas cell windows. We have measured the spatial dependence of ionization balance across the gas cell, and this measurement is consistent with propagation of a shock front across the gas cell target. We have measured blue-shifted satellites to several Li-like neon transitions that may indicate return-current driven jetting a high 1.5e8 cm/sec velocity. Using a gold z-pinch we have shown that key radiation is necessary to excite the He-like lines of neon. An attempt at a single shot gain measurement also indicates that radiation is not the only source of gas cell heating.

24282 (SAND–92-7284) **Measurements and analysis of the equivalent circuit of the GEC RF Reference Cell.** Verdeyen, J.T. (Illinois Univ., Urbana, IL (United States). Dept. of Electrical and Computer Engineering). Sandia National Labs., Albuquerque, NM (United States); Illinois Univ., Urbana, IL (United States). Dept. of Electrical and Computer Engineering. Sep 1992. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013498. Source: OSTI; NTIS; INIS; GPO Dep.

The equivalent circuit of the GEC RF Reference Cell is determined by the use of a vector impedance meter and reported here. The measurement procedure and data reduction techniques are discussed and typical data are presented from which the component values are determined. Once the circuit is established, one can use it to define the ABCD parameters of the Cell which relate the terminal measurements to those at the plasma. A significant and as yet unresolved question is emphasized: namely, "what is the path for the rf current?" An experimental procedure for answering this question is suggested, but there does not appear to be a simple "plasma" reason for the answer. To obtain such an answer is a challenge to the experimenters and modelers. While the emphasis is on the GEC RF Reference Cell, the procedure, data reduction techniques, and "the question" are pertinent to all reactors.

24283 (SAND–93-0037C) **1/f noise and oxide traps in MOSFETs.** Fleetwood, D.M. (Sandia National Labs., Albuquerque, NM (United States)); Meisenheimer, T.L.; Scofield, J.H. Sandia National Labs., Albuquerque, NM (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930866–1: 12. international conference on noise in physical systems and 1/f fluctuations, St. Louis, MO (United States), 16-20 Aug 1993). Order Number DE93007581. Source: OSTI; NTIS; GPO Dep.

MOSFETs historically have exhibited large 1/f noise magnitudes because of carrier-defect interactions that cause the number of channel carriers and their mobility to fluctuate. Uncertainty in the type and location of defects that lead to the observed noise have made it difficult to optimize MOSFET processing to reduce the level of 1/f noise. This has limited one's options when designing devices or circuits (high-precision analog electronics, preamplifiers, etc.) for low-noise applications at frequencies below ~10–100 kHz. We have performed detailed comparisons of the low-frequency 1/f noise of MOSFETs manufactured with radiation-hardened and non-radiation-hardened processing. We find that the same techniques which reduce the amount of MOSFET radiation-induced oxide-trap charge can also proportionally reduce the magnitude of the low-frequency 1/f noise of both unirradiated and irradiated devices. MOSFETs built in radiation-hardened device technologies show noise levels up to a factor of 10 or more lower than standard commercial MOSFETs of comparable dimensions, and our quietest MOSFETs show noise magnitudes that approach the low noise levels of JFETS.

24284 (SAND–93-0436C) **Surface-emitting laser-based optical switching: An update.** Zhou, P. (New Mexico Univ., Albuquerque, NM (United States). Center for High Technology Materials); Cheng, J.; Sun, S.Z.; Hersee, S.; Osinski, M.; Zolper, J.; Meyers, D.R.; Vawter, G.A. Sandia National Labs., Albuquerque, NM (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930135–4: International symposium on advanced electronic and optoelectronic materials, Los Angeles, CA (United States), 20-23 Jan 1993). Order Number DE93010689. Source: OSTI; NTIS; GPO Dep.

The properties of vertical-cavity surface-emitting lasers (VCSELS) and VCSEL-based optical switches using MOCVD-grown epitaxial material are discussed and sum their performance.

24285 (SAND–93-1006C) **Design and testing of planar magnetic micromotors fabricated by deep x-ray lithography and electroplating.** Guckel, H. (Wisconsin Univ., Madison, WI (United States). Dept. of Electrical and Computer Engineering); Christenson, T.R.; Skrobis, K.J.; Klein, J.; Karnowsky, M. Sandia National Labs., Albuquerque, NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC04-76DP00789. Grant EET-8815285;Grant 88-MC-507;Grant N00014-91-J-1876;Grant D (CONF-9305186–1: 7. international conference on solid state sensors and actuators, No City Given (Japan), 13-15 May 1993). Order Number DE93012856. Source: OSTI; NTIS; GPO Dep.

The successful design and testing of a three-phase planar integrated magnetic micromotor is presented. Fabrication is based on a modified deep X-ray lithography and electroplating or LIGA process. Maximum rotational speeds of 33,000 rpm are obtained in air with a nxor diameter of 285 μm and do not change when operated in vacuum. Real time rotor response is o with an integrated shaft encoder. Long lifetime is evidenced by testing to over $5(10)_7$ ration cycles without changes in performance. Projected speeds of the present motor configuration am in the vicinity of 100 krpm and are limited by torque ripple. Higher speeds, which are attractive for sensor applications. require constant torque characteristic excitation as is evidenced by ultracentrifuge and gyroscope design. Further understanding of electroplated magnetic material properties will drive these performance improvements.

24286 (UCRL-CR–109734) **DMS project, attachment 1: Final report and user's manual for the Analog and Driver Breadboard and Test Set.** Lawrence Livermore National Lab., CA (United States); Fairchild Space Co., Germantown, MD (United States). [1993]. 79p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93014110. Source: OSTI; NTIS; GPO Dep.

The LLNL/DMS Analog and Driver boards implement a variety of functions. The Analog section (card A1) provides excitation to 3 hot wire gyros, 3 accelerometers, 4 thermistors. The A1 card also collects telemetry on the above plus the primary power system (a solar cell array, NiCd and $LiSO_2$ batteries). The driver circuitry (card A2) provides the power section to the circuitry which controls the valves. A separate Test Set card (A3) exercises the other 2 cards. This final report and user's manual provides the circuit schematics for the DMS Analog, Driver, and Test Set. The Analog and Driver circuitry has been tested using the Test Set. All functions have been verified, and where possible, accuracy and noise have been measured. The results of these tested are included in this report.

24287 (UCRL-JC–110974) **Selenium x-ray laser line profile measurements.** Koch, J.A. (Lawrence Livermore National Lab., CA (United States)); MacGowan, B.J.; Da Silva, L.; Matthews, D.L.; Mrowka, S.; Underwood, J.H.; Batson, P.J. Lawrence Livermore

(CONF-920523–10: 3. international colloquium on x-ray lasers, Schliersee (Germany), 18-22 May 1992). Order Number DE93012580. Source: OSTI; NTIS; INIS; GPO Dep.

We discuss our recent measurements of the spectral width of the 206.38 Å laser in Ne-like Se. These measurements were performed over a wide range of amplifier length indicate an intrinsic line width of 50 mÅ FWHM (full-width at half-maximum), show gain narrowing to 10 mÅ in intermediate length amplifiers and show no significant re-broadening in We briefly discuss the experiments and interpretations.

24288 (UCRL-JC–111233) **Oscillator-amplifier experiments in neon-like yttrium.** Shimkaveg, G.M.; Carter, M.R.; Walling, R.S.; Ticehurst, J.M.; London, R.R; Stewart, R.E. Lawrence Livermore National Lab., CA (United States). 24 Jul 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920523–13: 3. international colloquium on x-ray lasers, Schliersee (Germany), 18-22 May 1992). Order Number DE93012577. Source: OSTI; NTIS; GPO Dep.

We present the first results from spatially and temporally separated x-ray lasing plasmas, shot sequentially with the emission of the first directed into the second.

24289 (UCRL-JC–111392) **Spatial coherence of soft x-ray lasers.** Trebes, J. Lawrence Livermore National Lab., CA (United States). 3 Aug 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920523–11: 3. international colloquium on x-ray lasers, Schliersee (Germany), 18-22 May 1992). Order Number DE93012497. Source: OSTI; NTIS; GPO Dep.

Short communication. X-RAY LASERS/beam optics; COHERENT RADIATION

24290 (UCRL-JC–111712) **Wavelength considerations in soft x-ray projection lithography.** Hawryluk, A.M.; Ceglio, N.M. Lawrence Livermore National Lab., CA (United States). 4 Aug 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9204120–8: Soft-x-ray projection lithography topical meeting, Monterey, CA (United States), 6-8 Apr 1992). Order Number DE93014115. Source: OSTI; NTIS; GPO Dep.

The choice of the operational wavelength for a SXPL system will affect a wide variety of system parameters such as optical design, sources, resists, multilayer mirrors, etc. Several system constraints limit the choice for the operational wavelength. In particular, optical imaging requirements place an upper limit and throughput issues place a lower limit on the wavelength selection. The authors have determined that there exist several discrete wavelength regions between 10 and 25 nm which satisfy the system imposed constraints of high resolution, large depth of focus and high throughput.

24291 (UCRL-JC–111714) **Reflection mask defect repair.** Hawryluk, A.M. (Lawrence Livermore National Lab., CA (United States)); Stewart, D. Lawrence Livermore National Lab., CA (United States). Sep 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9204120–7: Soft-x-ray projection lithography topical meeting, Monterey, CA (United States), 6-8 Apr 1992). Order Number DE93014113. Source: OSTI; NTIS; GPO Dep.

The authors have developed a new technique for the repair of opaque defects on soft x-ray projection lithography reflection masks using ion beam etching and a thin silicon overcoat on the multilayer mirror. This technique clears the defect without damaging the multilayer mirror or introducing an absorptive element into the multilayer. The procedure uses a beam of "low" atomic number ions (Si or Ar) of reduced beam energy, and a thin Si overcoat to protect the multilayer mirror.

24292 (UCRL-JC–111945) **Kinetics of high concentration arsenic deactivation at moderate to low temperatures.** Luning, S. (Stanford Univ., CA (United States). Center for Integrated Systems); Rousseau, P.M.; Griffin, P.B.; Plummer, J.D.; Carey, P.G. Lawrence Livermore National Lab., CA (United States). 14 Oct 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921204–2: International electron devices meeting, San Francisco, CA (United States), 6-9 Dec 1992). Order Number DE93013349. Source: OSTI; NTIS; GPO Dep.

This work investigates the kinetics of arsenic deactivation at temperatures from 500 to 800°C and for concentrations between 1 x 10^{20} and 1 x $10^{21}/cm^3$. Using profiles created by repeated laser melt annealing, the authors determine mobility as a function of both active and inactive dopant concentration and then characterize the dynamics of carrier deactivation. Retrograde resistivity versus concentration was observed at high doses, which is explained by a mobility reduction due to the inactive arsenic and by retrograde electrical activity of the dopant itself.

Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER40731. Order Number DE93014087. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes work carried out on DOE grant number DE-FG02- 92ER40731 during the period June 1, 1992 to the present. The report provides a brief summary of the program objectives, summarizes the main accomplishments and concludes with listings of conference and refereed publications.

24295 (UCRL-JC–110204) **Induction technology optimization code.** Caporaso, G.J.; Brooks, A.L.; Kirbie, H.C. Lawrence Livermore National Lab., CA (United States). 21 Aug 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9208109–87: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE93013415. Source: OSTI; NTIS; GPO Dep.

A code has been developed to evaluate relative costs of induction accelerator driver systems for relativistic klystrons. The code incorporates beam generation, transport and pulsed power system constraints to provide an integrated design tool. The code generates an injector/accelerator combination which satisfies the top level requirements and all system constraints once a small number of design choices have been specified (rise time of the injector voltage and aspect ratio of the ferrite induction cores, for example). The code calculates dimensions of accelerator mechanical assemblies and values of all electrical components. Cost factors for machined parts, raw materials and components are applied to yield a total system cost. These costs are then plotted as a function of the two design choices to enable selection of an optimum design based on various criteria. The Induction Technology Optimization Study (ITOS) was undertaken to examine viable combinations of a linear induction accelerator and a relativistic klystron (RK) for high power microwave production. It is proposed, that microwaves from the RK will power a high-gradient accelerator structure for linear collider development. Previous work indicates that the RK will require a nominal 3-MeV, 3-kA electron beam with a 100-ns flat top. The proposed accelerator-RK combination will be a high average power system capable of sustained microwave output at a 300-Hz pulse repetition frequency. The ITOS code models many combinations of injector, accelerator, and pulse power designs that will supply an RK with the beam parameters described above.

24296 (BNL–48346) **Advanced R&D for electron and photon beams at Brookhaven National Laboratory.** Kirk, H.G. Brookhaven National Lab., Upton, NY (United States). Aug 1989. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CAP–92-ATF-89C;CONF-890786–5: US particle accelerator school, Upton, NY (United States), 24 Jul - 4 aug 1989). Order Number DE93010939. Source: OSTI; NTIS; INIS; GPO Dep.

The Brookhaven Accelerator Test Facility consists of a 50-MeV linear accelerator and a laser system capable of generating short (a few picoseconds) laser pulses at both UV (266 nm) and infrared (10 μm) wavelengths. With these systems in place, the ATF has unique capabilities for the study of fundamental interactions between charged-particle beams and intense electromagnetic radiation. The principal research goals of the Accelerator Test Facility (ATF) axe the following. Laser Acceleration Program: We wig study the principles and techniques of particle acceleration at ultra-high frequencies (up to 30 THz) and with very high acceleration gradients (up to 1 GV/m). Production of Coherent Radiation: We wish to develop the next generation of photon sources with features like (a) short pulses (picoseconds or less), (b) coherence, and (c) high peak power. All of these attributes can be provided by free-electron lasers. High-brightness sources: A common denominator for the above programs is the need for electron beams with very small transverse and longitudinal emittances. We will devote a substantial amount of our resources to the production and understanding of electron beams that have these attributes. We will build advanced electron sources such as switched-power devices and rf guns with photocathodes. Important applications of this line of research include the development of high-luminosity linear colliders and free-electron lasers in the XUV regime.

24297 (BNL–48604) **The ADRIA project for high intensity radioactive beams production.** Bisoffi, G. (Laboratori Nazionali di Legnari, Legnaro (Italy)); Cavenago, M.; Dainelli, A.; Facco, A.; Fortuna, G.; Lombardi, A.; Moisio, M.F.; Pisent, A.; Spolaore, P.; Tiveron, B.; Ruggiero, A.G.; Tecchio, L. Brookhaven National Lab., Upton, NY (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9203164–3: International workshop on the physics and techniques of secondary nuclear beams, Dourdan (France), 23-25 Mar 1992). Order Number DE93010866. Source: OSTI; NTIS; INIS; GPO Dep.

A proposal of an accelerator complex (ADRIA) for the Laboratori Nazionali di Legnaro (LNL) is described in this report. The main components of the complex are a Heavy Ion Injection system and two rings, a Booster and a Decelerator, both with a maximum rigidity of 22.25 Tm, connected by a Transfer Line where exotic proposal has two main goals consisting in the isotopes are produced and selected. The proposal has two main goals consisting in the acceleration of stable ion species up to kinetic energies of the order of few GeV/u, at a repetition rate of 10 Hz with intensities of about 10^{12} ions per second, for fixed target experiments in nuclear physics and for the production of fully stripped radioactive beams, using particle fragmentation method for nuclear spectroscopy experiments. Fragments are accumulated in the Decelerator, with intensities $10^{8} \div 10^{9}$ ions/s, cooled and delivered at the production energies or decelerated down to energies of few MeV/u, in proximity of the Coulomb barrier.

24298 (BNL–48790) **The design of the MAD Design Program.** Niederer, J. Brookhaven National Lab., Upton, NY (United States). [1992]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-921077–4: Stability of particle motion in storage rings, Upton, NY (United States), 18-24 Oct 1992). Order Number DE93013343. Source: OSTI; NTIS; INIS; GPO Dep.

The study of long term stability in particle accelerators has long been served by a group of widely circulated computer programs. The progress in these programs has mirrored the growth and versatility in accelerator size, complexity, and purpose, as well as evolving technologies in computing software and hardware. A number of large accelerator projects during the last decade were designed with the aid of physics programs either written for, or tailored for the project at hand, each invariably benefiting from contributions of previous workers. This paper outlines the recent history of of expample of an accelerator lattice model tool kit, the Methodical Accelerator Design (MAD) Program, which has tried to knit together this collective wisdom of the accelerator community, The ideas behind the software design of the program itself are traced here; the accelerator physics contents and origins are thoroughly documented elsewhere. These informal notes have a Brookhaven flavor, in part because of early BNL efforts to generalize the ways that technical problems are organized and presented to computers. Some recent BNL applications not covered in the extensive CERN documentation are also included.

24299 (BNL–70199) **[Electron-proton collision physics]: Foreign trip report, July 18, 1992–August 1, 1992.** Weng, Wu-Tsung. Brookhaven National Lab., Upton, NY (United States). 27 Aug 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93012121. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler learned from the international conference that HERA started its electron-proton collision physics run in June, 1992; that a major push for future linear colliders has taken place in various laboratories around the world; and that harmonic cavities can help in both space charge tune shift and transition crossing in a proton synchrotron. The visit to CERN brought the traveler up to date on the operational status and goals of the LEP collider and the design of the LHC for both proton and heavy ion physics. During the visit to Orsay, the traveler learned about the rich history and accomplishments of LAL at Orsay, the status of synchrotron radiation research at LURE, and the free electron laser progress of CLIO. This knowledge and the information gained from the whole trip win be extremely useful in preparing the AGS for both high intensity proton running and for heavy ion injection into MIC.

24300 (INIS-RU–343, pp. 74-79) **Automated control system in charged particle accelerators.** Vit'ko, V.I. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Goncharov, I.G.; Kovalenko, G.D. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i; AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1991. [80p.] (In Russian). In *Nuclear-physical researches (Theory and experiment): Scientific-technical collection.* Order Number DE93626131. Source: OSTI; NTIS (US Sales Only); INIS.

A general approach to the design of automated radiation safety systems at charged particle accelerators is described. Parameters of high-energy electron accelerators of the Kharkov Physics and Engineering Institute are presented. Characteristics of the surrounding radiation fields are given. Ionizing radiation transducers which can be used in automated systems are considered. Local radiation monitoring station based on the LUE-2000 accelerator of the institute is described. 9 refs.; 4 figs.; 1 tab.

24301 (JINR-R–10-91-302) **Automated workstation for MT-25 microtron operator: Conception and principal functions.** Ivanov, V.G.; Nodarse, F.F.; Belov, A.G.; Zun'iga, Kh. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1991. [16p.] (In Russian). Order Number DE93626132. Source: OSTI; NTIS (US Sales Only); INIS.

The goal of this paper is to create a AHM MT-25 Automated workstation in order to help microtron operator in the preparation, start, technical fault search and adjust, use, turn off and maintenance processes. The ARM MT-25 requirements are personal computer, compatible with IBM PC XT/AT with at least 640 RAM, medium resolution graphic display, hard disk and DOS 3.3 operating system. 4 refs.; 8 figs.

24302 (JINR-R–16-92-36) **Reference neutron fields for metrology of radiation monitoring.** Alejnikov, V.E.; Bamblevskij, V.P.; Komochkov, M.M.; Krylov, A.R.; Mokrov, Yu.V.; Timoshenko, G.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation).

1992. [12p.] (In Russian). Order Number DE93626133. Source: OSTI; NTIS (US Sales Only); INIS.

The set of reference neutron fields created in the JINR for metrology of radiation monitoring is described. The set comprises reference fields based on Cf-252 in polyethylene moderators with diameters 12.7 cm and 29.2 cm and two reference fields based on 660 MeV Laboratory of Nuclear Problems phasotron. 11 refs.; 7 figs.; 1 tab.

24303 (LA-UR–93-1872) **Special design problems and solutions for high powered continuous duty linacs.** Liska, D. (Los Alamos National Lab., NM (United States)); Carlisle, L.; McCauley, G.; Ellis, S.; Ilg, T.; Smith, P. Los Alamos National Lab., NM (United States); Grumman Aerospace Corp., Bethpage, NY (United States). [1993]. 4p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93014476. Source: OSTI; NTIS; GPO Dep.

Several high powered linac designs are being considered for various purposes including radioactive waste treatment, tritium production, and neutron factories for materials studies. Since the fractional beam losses must be in the 10^{-5} to 10^{-6} range and are clearly subject to operational variables, the design engineers are forced to develop concepts which combine maintainability under radioactivity conditions, high availability, and very high reliability while dealing with the operating parameters resulting from CW operation. Several design solutions to selected problems are presented.

24304 (ORNL/FTR–4276) **[Travel to Italy, Switzerland, and Germany for meetings on electrostatic accelerator and associated boosters]: Foreign trip report, May 30, 1992–June 11, 1992.** Olsen, D.K. Oak Ridge National Lab., TN (United States). 25 Jun 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011064. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended the Sixth International Conference on Electrostatic Accelerators and Associated Boosters, Padova, Italy, and presented an invited paper entitled "Opportunities with Radioactive Ion Beams." The traveler also visited the ISOLDE facility, Geneva, Switzerland, to discuss RIB production and the University of Giessen, Giessen, FRG, to discuss high-resolution mass separators. The traveler learned many important details for the ORNL RIB project and obtained a much clearer understanding of the opportunities and problems with RIBs in Europe.

24305 (SSCL-Preprint–323) **Measurements of the ground motion vibrations at the SSC.** Parkhomschuk, V.V.; Shiltsev, V.D.; Weaver, H.J. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–91: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014084. Source: OSTI; NTIS; INIS; GPO Dep.

The results of seismic ground measurements at the Superconducting Super Collider (SSC) Accelerator Systems String Test (ASST) site are presented. Spectral analysis of the data obtained in a large frequency band from 0.05 Hz to 200 Hz was performed.

24306 (SSCL-Preprint–375) **Dynamic response analysis of the LBL Advanced Light Source synchrotron radiation storage ring.** Leung, K. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–30: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014180. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents the dynamic response analysis of the photon source synchrotron radiation storage ring excited by ground motion measured at the Lawrence Berkeley Laboratory advanced light source building site. The high spectral brilliance requirement the photon beams of the advanced light source storage ring specified displacement of the quadrupole focusing magnets in the order of 1 micron in vertical motion.There are 19 magnets supported by a 430-inch steel box beam girder. The girder and all magnets are supported by the kinematic mount system normally used in optical equipment. The kinematic mount called a six-strut magnet support system is now considered as an alternative system for supporting SSC magnets in the Super Collider. The effectively designed and effectively operated six-strut support system is now successfully operated for the Advanced Light Source (ALS) accelerator at the Lawrence Berkeley Laboratory. This paper will present the method of analysis and results of the dynamic motion study at the center of the magnets under the most critical excitation source as recorded at the LBL site.

24307 (SSCL-Preprint–389) **Status of the SSC.** Briggs, R.J. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–16: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014183. Source: OSTI; NTIS; INIS; GPO Dep.

The Superconducting Super Collider (SSC) is a proton-proton colliding beam accelerator which, when completed, will provide collision energies of 40 TeV in the center-of-mass, at a luminosity of $10^{33}/cm^2/sec^{-1}$. This paper will describe the current status of the design and construction of the project.

24308 (BNL–48676) **Determination of beam position monitor offset in focusing wigglers.** Ben-Zvi, I. (Brookhaven National Lab., Upton, NY (United States)); Hung, Chi-Ming. Brookhaven National Lab., Upton, NY (United States). 25 Sep 1992. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93014024. Source: OSTI; NTIS; GPO Dep.

In this report the authors study the possibility of determining the offset in beam position-monitoring instruments (e.g. strip-line detectors) by means of changing the natural focusing strength of a planar untapered wiggler. The focusing of the wiggler provides a correlation between the transverse positions of the electron beam at different locations along the wiggler. By varying the strength of the wiggler field, it is possible to deduce the offset in the position monitors through a least square fit. The fitting is relatively straight forward if one has an ideal wiggler field free of error. Existence of wiggler field error introduces new variables into the fitting procedure. It will be shown that one needs a minimum of 2 wiggler field settings for the case without error in the wiggler field, while 4 field settings are required for the case with a particular model of the wiggler field error. The results of numerical simulations suggest that it is possible with this method to determine the offsets to an accuracy comparable with the sensitivity of strip-line monitors (i.e. a few microns).

24309 (BNL–48679) **Ion shaking in the 200 MeV XLS-ring.** Bozoki, E.; Kramer, S.L. Brookhaven National Lab., Upton, NY (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-920315–47: 3. European particle accelerator conference (EPAC-3): Accelerators for special applications, Berlin (Germany), 24-28 Mar 1992). Order Number DE93014057. Source: OSTI; NTIS; INIS; GPO Dep.

It has been shown that ions, trapped inside the beam's potential, can be removed by the clearing electrodes when the amplitude of the ion oscillation is increased by vertically shaking the ions. We will report on a similar experiment in the 200 Mev XLS ring. The design of the ion clearing system for the ring and the first results obtained, were already reported. In the present series of experiments, RF voltage was applied on a pair of vertical strip-lines. The frequency was scanned in the range of the ion (from H_2 to CO_2) bounce frequencies in the ring (1–10 MHz). The response of the beam size, vertical betatron tune and lifetime was studied.

24310 (BNL–48905) **Bunched beam longitudinal instability: Coherent dipole motion.** Zhang, S.Y.; Weng, W.T. Brookhaven National Lab., Upton, NY (United States). Alternating Gradient Synchrotron Dept. 23 Apr 1993. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016.

(AGS/AD–93-6). Order Number DE93013344. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper, the authors present a new formulation for the longitudinal coherent dipole motion, where a quadrature response of the environmental impedance is shown to be the effective longitudinal impedance for the beam instability. The Robinson-Pedersen formulation for the longitudinal dipole motion is also presented, the difference of the two approaches is discussed in the comparison. The results by using the Sacherer integral equation for the coherent dipole motion can generate the same results as by using the other two approaches, except for a scaling difference. The formulation is further generalized to the rigid bunch motion using signal analysis method, where a form factor shows up naturally. Finally, the formulation is applied to solve the coupled bunch instabilities. Examples of the AGS Booster and the AGS coupled bunch instabilities are used to illustrate the applications of the formulation.

24311 (BNL–48906) **Tevatron studies report.** Jackson, G. (Fermi National Accelerator Lab., Batavia, IL (United States)); McConnell, D.; Fellenz, B.; Raka, E.; Yamin, S.P. Brookhaven National Lab., Upton, NY (United States). 23 Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (AGS/AD–93-4). Order Number DE93013400. Source: OSTI; NTIS; INIS; GPO Dep.

On Wednesday, July 24, 1991, we studied the effectiveness of "constant amplitude" transverse damping at the Fermilab Tevatron. In this mode of damping, whenever a bunch's displacement exceeds a specified threshold, a constant (usually maximum) aplitude correction pulse is applied to the damper kicker. This is in contrast to the "linear" mode, where the kick is proportional to the displacement.

24312 (BNL–48907) **Spectrum analysis in beam diagnostics.** Zhang, S.Y.; Weng, W.T. Brookhaven National Lab., Upton, NY (United States). 23 Apr 1993. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93013401. Source: OSTI; NTIS; INIS; GPO Dep.

In this article, we discuss fundamentals of the spectrum analysis in beam diagnostics, where several important particle motions in a circular accelerator are considered. The properties of the Fourier transform are presented. Then the coasting and the bunched beam motion in both longitudinal and transverse are studied. The discussions are separated for the signal particle, multiple particle, and the Schottky noise cases. To demonstrate the interesting properties of the beam motion spectrum, time domain functions are generated, and then the associated spectra are calculated and plotted. In order to show the whole picture in a single plot, some data have been scaled, therefore they may not be realistic in an accelerator.

24313 (FNAL/C–92/389) **Operational experience with the Fermilab Linac.** Allen, L.J.; Lennox, A.J.; Schmidt, C.W. Fermi National Accelerator Lab., Batavia, IL (United States). Dec 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9208109–81: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE93011640. Source: OSTI; NTIS; INIS; GPO Dep.

The Fermilab 200-MeV Linac has been in operation for nearly 22 years as a proton injector to the Booster synchrotron. It presently accelerates H^- ions to 200 MeV for charge-exchange injection into the Booster and to 66 MeV for the production of neutrons at the Neutron Therapy Facility. The beam intensity is typically 35 mA with pulse widths of 30 μsec for the Booster for high energy physics and 57 μsec for NTF at a maximum of 15 pulses per sec. During a typical physics run of nine to twelve months, beam is available for greater than 98% of the scheduled time. The Linac history, operation, tuning, stability and reliability will be discussed.

24314 (IFVE-OKU–90-83) **Accelerated beam recapturing in IHEP machine at 33.3 MHz.** Kuznetsov, S.A.; Myaeh, Eh.A.; Nelipovich, E.S.; Pashkov, P.T.; Smirnov, A.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1990. [15p.] (In Russian). Order Number DE93626147. Source: OSTI; NTIS (US Sales Only); INIS.

Possibilities to form particle bunches in the IHEP machine whose longitudinal parameters would satisfy the requirements imposed by 3x3 TeV p-p program of UNK are studied. The numerical analysis of quasiadiabatic debunching of the accelerated proton beam and its further recapturing into the stable phase oscillation mode at 33.3 MHz is carried out. The peculiarities of the RF system designed for these purposes with an account of the strong beam loading are discussed. The cavities main characteristics have been calculated. 9 refs.; 10 figs.

24315 (INIS-RU–343, pp. 54-57) **On construction of numerical methods in problems of beam control.** Ovsyannikov, D.A. (Leningradskij Gosudarstvennyj Univ., Leningrad (Russian Federation)); Kharchenko, A.G.; Papkovich, V.G. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i; AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1991. [80p.] (In Russian). In *Nuclear-physical researches (Theory and experiment): Scientific-technical collection.* Order Number DE93626131. Source: OSTI; NTIS (US Sales Only); INIS.

Construction of new numerical optimization methods in problems of charged particle beam control is presented on the basis of the analysis of phase-controlled region boundary dynamics. Such being the case, the number of computations is decreased significantly. 3 refs.; 1 tab.

24316 (INIS-RU–343, pp. 49-53) **Analysis of transverse instability on a chain of resonators accounting for bunch trajectory disturbance.** Bulyak, E.V. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Mondrus, I.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i; AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1991. [80p.] (In Russian). In *Nuclear-physical researches (Theory and experiment): Scientific-technical collection.* Order Number DE93626131. Source: OSTI; NTIS (US Sales Only); INIS.

Theoretical consideration of the development dynamics of transverse instability in a chain of uncoupled cylindric resonators takes into account the excitation of bunch trajectory inside the resonator by difocusing oscillation field. A generalized transverse instability equation is derived and integral representation of its solution is found. The analysis of this solution forms the basis for formulation of 'thin lens' approximation applicability conditions when bunch trajectory excitation is not accounted for. The reliability of these conditions is confirmed through comparison of asymptotic theory results and numeric simulation of transverse instability. 8 refs.; 4 figs.; 1 tab.

24317 (INIS-RU–343, pp. 45-48) **Transverse dynamics of a beam in a chain of uncoupled resonators.** Bulyak, E.V. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Kurilko, V.I.; Mondrus, I.N.; Papkovich, V.G. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i; AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1991. [80p.] (In Russian). In *Nuclear-physical researches (Theory and experiment): Scientific-technical collection.* Order Number DE93626131. Source: OSTI; NTIS (US Sales Only); INIS.

A method is proposed and realized for full-scale numerical simulation of the transverse dynamics of a train of point charged bunches accelerated in a chain of identical uncoupled resonators. Selfconsistent system of equations of transverse motion of such bunches in a total field of spontaneous transition radiation of the predecessors of each bunch at f_{11} frequency of defocusing TM_{110}-oscillations of the resonators is reduced to the system of the finite number of algebraic equations for amplitudes of generalized shift moments of such bunches in each resonator. Numerical solutions of this system are presented for a number of specific values of the parameters of the accelerating structure and accelerating beam as well as various starting conditions at the structure's inlet. The obtained results are used for controlling reliability level of the known methods of analytical description of the dynamics under consideration. 6 refs.; 3 figs.

24318 (INIS-RU–343, pp. 40-42) **EH_{11} wave reflection effecting on the dynamics of beam transverse instability in an electron linac.** Ajzatskij, N.I. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Opanasenko, A.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i; AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1991. [80p.] (In Russian). In *Nuclear-physical researches (Theory and experiment): Scientific-technical collection.* Order Number DE93626131. Source: OSTI; NTIS (US Sales Only); INIS.

Critical current dependences on decelerating structure parameters and coefficient of EH_{11} wave reflection from structure's flanges are derived. It is shown that for structures with positive EH_{11} wave dispersion, critical reflection current increases by several orders of magnitude as reflection coefficient decreases; it points to a possibility to use these structures in high-current electron linacs. As regards suppression of transverse instability, two methods of measuring EH_{11} wave dispersion in an ring diaphragmatic waveguide are analyzed: through increase of a/λ load factor and by making thin radial cuts on the diaphragms. 11 refs.; 3 figs.

24319 (INIS-RU–343, pp. 27-29) **System for measuring accelerated particle bunch charge.** Rozenblat, A.M. (Moskovskij Inzhenerno-Fizicheskij Inst., Moscow (Russian Federation)). Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i; AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1991. [80p.] (In Russian). In *Nuclear-physical researches (Theory and experiment): Scientific-technical collection.* Order Number DE93626131. Source: OSTI; NTIS (US Sales Only); INIS.

A system for measuring individual bunches of accelerated particle pulsed beams is described; the system uses a Faraday cup as the primary charge converter. The operation of the system is based on conversion of bunch charge value in a pulse duraction. At the first stage of operation, bunch charge is partially redistributed between the Faraday cup and buffer integrator. At the second stage, this charge is compensated by known and stable current with parallel resolution of time interval within which complete compensation occurrs. 3 refs.; 2 figs.

24320 (INIS-RU–343, pp. 61-65) **Effect of beam holes on collective transition radiation.** Vorogushin, M.F. (Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (Russian Federation)); Chernogubovskij, M.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i; AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1991. [80p.] (In Russian). In *Nuclear-physical researches (Theory and experiment): Scientific-technical collection.* Order Number DE93626131. Source: OSTI; NTIS (US Sales Only); INIS.

Beam-excited hole diffraction field is considered through determination of additional magnetic shield field. The method of delayed potentials and mirror reflections is used. Hole diffraction field is found and that allows to take into account its effect on the particle dynamics in accelerating structures and beam transport devices. Radiation energy in hole field is determined; it is ascertained that the presence of beam holes results in a decrease of energy losses for collective transition radiation in the resonator. 6 refs.; 2 figs.

24321 (INIS-RU–343, pp. 66-70) **Transition radiation in a waveguide during sequence intersection by a charged particle of waveguide walls.** Barsukov, K.A. (Erevanskij Fizicheskij Inst., Erevan (Armenia)); Begloyan, Eh.A.; Laziev, Eh.M.; Marabyan, R.I. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i; AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1991. [80p.] (In Russian). In *Nuclear-physical researches (Theory and experiment): Scientific-technical collection.* Order Number DE93626131. Source: OSTI; NTIS (US Sales Only); INIS.

Radiation of a charged particle intersecting a rectangular waveguide along periodic trajectory is studied. Expressions for radiation fields and energies are derived. When the number of intersections is high, radiation spectrum is quasidiscrete and intensity of individual lines depends on the parameters of the problem. Possibility of optimal take off of radiation energy is investigated. 4 refs.; 1 fig.

24322 (JINR–9-90-485) **Computerized simulation of a correction for the nuclotron closed orbit.** Akishin, P.G. (and others); Dinev, D.Kh.; Issinskij, I.B. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1990. [15p.] (In Russian). Order Number DE93626150. Source: OSTI; NTIS (US Sales Only); INIS.

Four different methods for closed orbit correction in synchrotrons and results of the computerized simulations of the closed orbit correction for the JINR nuclotron are presented. For the irregular arrangement of the 20 corrector magnets and 24 beam position monitors the dynamic and LSQ correction methods have turned out the most effective one. The LSQ method allowed to reach 3.6 and 4.0 correction quality for horizontal and vertical planes respectively. 9 refs.; 4 figs.; 2 tabs.

24323 (JINR-E–9-91-382) **The ion cooling in EBIS.** Becker, R.; Donets, E.D.; Shirkov, G.D. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1991. [7p.] Order Number DE93626148. Source: OSTI; NTIS (US Sales Only); INIS.

The article is devoted to the problems of multicharged ion losses and ion cooling in EBIS. The loss rates for ions with Boltzmann distribution function of energies for different ionic species are determined. The results of the work have shown that the lightest ions are required for ion cooling. The continuous flow of light ions is proposed for cooling. The necessary parameters of light ion flow are defined. 8 refs.; 1 fig.; 1 tab.

24324 (JINR-R–9-92-129) **Algorithm of synthesis and analysis of magnetic structure characteristics of isochronous cyclotrons with cylindrical poles.** Gul'bekyan, G.G.; Franko, J. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Reactions. 1992. [16p.] (In Russian). Order Number DE93626149. Source: OSTI; NTIS (US Sales Only); INIS.

The analysis of some magnetic structure dependencies of the compact cyclotron magnets with cylindrical poles made of magnetic iron with carbon content from 0.03 up to 0.07% is carried out. 8 refs.; 13 figs.

24325 (LA-UR–93-1961) **Advanced computers and simulation.** Ryne, R.D. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–78: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014354. Source: OSTI; NTIS; INIS; GPO Dep.

Accelerator physicists today have access to computers that are far more powerful than those available just 10 years ago. In the early 1980's, desktop workstations performed less one million floating point operations per second (Mflops), and the realized performance of vector supercomputers was at best a few hundred Mflops. Today vector processing is available on the desktop, providing researchers with performance approaching 100 Mflops at a price that is measured in thousands of dollars. Furthermore, advances in Massively Parallel Processors (MPP) have made performance of over 10 gigaflops a reality, and around mid-decade MPPs are expected to be capable of teraflops performance. Along with advances in MPP hardware, researchers have also made significant progress in developing algorithms and software for MPPS. These changes have had, and will continue to have, a significant impact on the work of computational accelerator physicists. Now, instead of running particle simulations with just a few thousand particles, we can perform desktop simulations with tens of thousands of simulation particles, and calculations with well over 1 million particles are being performed on MPPs. In the area of computational electromagnetics, simulations that used to be performed only on vector supercomputers now run in several hours on

desktop workstations, and researchers are hoping to perform simulations with over one billion mesh points on future MPPs. In this paper we will discuss the latest advances, and what can be expected in the near future, in hardware, software and applications codes for advanced simulation of particle accelerators.

24326 (SLAC-PUB–6163) **Full-turn symplectic map from a generator in a Fourier-spline basis.** Berg, J.S. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)); Warnock, R.L.; Ruth, R.D.; Forest, E. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Apr 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515 ;AC03-76SF00098. (LBL–34036;CONF-930269–13: Computational accelerator physics conference (CAP93), Pleasanton, CA (United States), 22-26 Feb 1993). Order Number DE93013107. Source: OSTI; NTIS; INIS; GPO Dep.

Given an arbitrary symplectic tracking code, one can construct a full-turn symplectic map that approximates the result of the code to high accuracy. The map is defined implicitly by a mixed-variable generating function. The implicit definition is no great drawback in practice, thanks to an efficient use of Newton's method to solve for the explicit map at each iteration. The generator is represented by a Fourier series in angle variables, with coefficients given as B-spline functions of action variables. It is constructed by using results of single-turn tracking from many initial conditions. The method has been appliedto a realistic model of the SSC in three degrees of freedom. Orbits can be mapped symplectically for 10^7 turns on an IBM RS6000 model 320 workstation, in a run of about one day.

24327 (SSCL–606) **Longitudinal head-tail instability in a non-harmonic potential well.** Chen, B.; Chao, A. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE93013942. Source: OSTI; NTIS; INIS; GPO Dep.

A perturbation technique is developed that can be applied to study the collective instability problem when the unperturbed system is not described by a simple harmonic oscillator. The Longitudinal Head-Tail instability effect is well studied as applications of this technique. Applications of the longitudinal head-tail instability effects to the CERN SPS and the SSC are included.

24328 (SSCL–618) **ZBEAM, charge tracing code for the SSC environment.** Tsyganov, E. (Superconducting Super Collider Lab., Dallas, TX (United States)); Zinchenko, A. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE93013945. Source: OSTI; NTIS; INIS; GPO Dep.

A full Monte Carlo computer code describing behavior of electrons and ions in the vicinity of any space charges, electrical fields, and magnetic fields is described. Parameters of the code are optimized for the Superconducting Super Collider environment. Some results of calculations with a neutral beam profile monitor, a residual gas beam profile monitor, and an electron beam emittance monitor are presented to illustrate the method.

24329 (SSCL-Preprint–149-Rev.1) **A parallel implementation of particle tracking with space charge effects on an Intel iPSC/860: Revision 1.** Chang, L.C.; Bourianoff, G.; Cole, B.; Machida, S. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–8-Rev.1: 5. annual international industrial symposium on the super collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93012307. Source: OSTI; NTIS; INIS; GPO Dep.

Particle-tracking simulation is one of the scientific applications that is well-suited to parallel computations. At the Superconducting Super Collider, it has been theoretically and empirically demonstrated that particle tracking on a designed lattice can achieve very high parallel efficiency on a MIMD Intel iPSC/860 macene. The key to such success is the realization that the particles can be tracked independently without considering their interaction. The perfectly parallel nature of particle tracking is broken if the interaction effects between particles are included. The space charge introduces an electromagnetic force that will affect the motion of tracked particles in 3-D space. For accurate modeling of the beam dynamics with space charge effects, one needs to solve three-dimensional Maxwell field equations, usually by a particle-in-cell (PIC) algorithm. This will require each particle to communicate with its neighbor grids to compute the momentum changes at each time step. It is expected that the 3-D PIC method will degrade parallel computer. In this paper, we describe an efficient scheme for implementing particle tracking with space charge effects on an INTEL iPSC/860 machine. Experimental results show that a parallel efficiency of 75% can be obtained.

24330 (SSCL-Preprint–220) **DILUTE: A code for studying beam evolution under rf noise.** Shih, H.J. (Superconducting Super Collider Lab., Dallas, TX (United States)); Ellison, J.; Schiesser, W. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930269–12: Computational accelerator physics conference (CAP93), Pleasanton, CA (United States), 22-26 Feb 1993). Order Number DE93011605. Source: OSTI; NTIS; INIS; GPO Dep.

Longitudinal beam dynamics under rf noise has been modeled by Dome, Krinsky and Wang using a diffusion-inaction PDE. If the primary interest is the evolution of the beam in action, it is much simpler to integrate the model PDE than to undertake tracking simulations. Here we describe the code that we developed to solve the model PDE using the numerical Method of Lines. Features of the code include (1) computation of the distribution in action for the initial beam from a Gaussian or user-supplied distribution in longitudinal phase space, (2) computation of the diffusion coefficient for white noise or from a user-supplied spectral density for non-white noise, (3) discretization of the model PDE using finite-difference or Galerkin finite-element approximations with a uniform or non-uniform grid, and (4) integration of the system of ODEs in time by the solver RKF45 or a user-supplied ODE solver.

24331 (SSCL-Preprint–299) **Tune shift effect due to the sextupole longitudinal periodic structure in the superconducting dipole magnets.** Lopez, G.; Chen, S. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–36: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014256. Source: OSTI; NTIS; INIS; GPO Dep.

Using the standard Hamiltonian perturbation theory, the tune shift due to the sextupole periodic pattern in the superconducting dipole magnets is estimated for the Superconducting Super Collider (SSC) machine. The result indicates that this effect is of the order of 10^{-9}. Therefore, this effect can be neglected in the dynamics of the beam.

24332 (SSCL-Preprint–304) **Head-on and long-range beam-beam tune shift spread in the SSC.** Lopez, G. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–24: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014259. Source: OSTI; NTIS; INIS; GPO Dep.

The head-on and long-range incoherent tune shifts for the Superconducting Super Collider (SSC) are estimated using the numerical integration of the analytical expression coming from the first order in the perturbation strength. The variation of the tune shift as a function of the displacements of the charged particle in the vertical and horizontal planes is studied with the nominal parameters for the SSC. A scaling expression is obtained for the parameters involved in the beam-beam tune shifts, which allows us to predict the effect in the incoherent tune shift spread under changes in these parameters.

24333 (SSCL-Preprint–351) **Beam coupling impedance measurements and simulations of a beam pipe liner with pumping holes or slots.** Ruiz, E.; Walling, L.; Goren, Y.; Spayd, N. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–18: International particle accelerator conference, Washington, DC

(United States), 17-20 May 1993). Order Number DE93014270. Source: OSTI; NTIS; INIS; GPO Dep.

We report the results of measurement using the wire method and numerical simulations using the code HFSS (High-Frequency Structure Simulator) of the beam coupling impedance of the proposed liner for the collider ring of the SSC. We compare the results of the measurements and simulations to analytical estimates by R. Gluckstern and S. Kurennoy, and conclude that the additional coupling impedance introduced by a liner with pumping holes can be acceptable.

24334 (SSCL-Preprint–355) **Non linear effects in ferrite tuned cavities.** Goren, Y. (Superconducting Super Collider Lab., Dallas, TX (United States)); Mahale, N.; Walling, L.; Enegren, T.; Hulsey, G.; Yakoviev, V.; Petrov, V. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–34: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014136. Source: OSTI; NTIS; INIS; GPO Dep.

The phenomenon of dependence of the resonance shape and frequency on the RF power level in perpendicular biased ferrite-tuned cavities has been observed by G. Hulsey and C. Friedrichs in the SSC test cavity experiment. This paper presents a theoretical as well as numerical analysis of this phenomenon and compares the results with experimental data. The effect of this nonlinearity on the SSC low energy booster prototype cavity is discussed.

24335 (SSCL-Preprint–365) **Emittance growth in MEB and its control.** Huang, Y.; Machida, S.; Gerig, R. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–26: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014265. Source: OSTI; NTIS; INIS; GPO Dep.

There are effects in the Medium Energy Booster (MEB) of the Superconducting Super Collider (SSC) which will lead to growth of the transverse beam emittance. Among them are space charge, decoherence due to residual chromaticity and nonlinearity of field, coherent instabilities, etc. This paper numerically estimates the strength of these effects on the beam stability and the emittance growth. To ensure that the emittance growth is within the stringent emittance budget of the SSC accelerator complex, a few feasible cures have been planned. Their improvements on beam quality are also described in this paper.

24336 (SSCL-Preprint–382) **Bunch coalescing studies for the SSC.** Mahale, N.; Yan, Y.T.; Ellison, J. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–13: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014106. Source: OSTI; NTIS; INIS; GPO Dep.

It may become necessary to enhance the luminosity and increase the bunch spacing in the Superconducting Super Collider (SSC). Here we study the feasibility of bunch coalescing to achieve this. We choose the Medium Energy Booster (MEB) at extraction, momentum 200GeV, to perform the operation. In order to properly align the bunches we propose to linearize the RF using the second and third harmonics. Theoretical studies with simulation are presented. The program ESME is used for the simulation.

24337 (SSCL-Preprint–386) **Dynamic aperture of the chromatically corrected Collider lattice.** Pilat, F.; Nosochkov, Y.; Sen, T.; Stiening, R. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–88: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014099. Source: OSTI; NTIS; INIS; GPO Dep.

A scheme for correcting the second order chromatic effects generated by the Interaction Regions (IRS) has been designed for the SSC Collider ring, where four families of sextupoles are located in the arc sectors next to the East Cluster. The effect of these sextupoles on the dynamic and momentum aperture of the machine has been evaluated with a simulation model in which alignment, field errors and operational corrections are realistically represented. Several optics configurations with different values of β at the Interaction Points (IPs) have been studied for different sets of field error specifications in the IR quadrupoles. The local chromaticity correction system improves the momentum aperture of the Collider for every configuration studied with no relevant loss of dynamic aperture on momentum, when the effect of errors are taken into consideration.

This report is a description of the current status of the magnetic measurement facility and is a basic instructional manual for the operation of the facility and its components. Please refer to the appendices for more detailed information about specific components and procedures. The purpose of the magnetic measurement facility is to take accurate measurements of the magnetic field in the gay of the IDs in order to determine the effect of the ID on the stored particle beam and the emitted radiation. The facility will also play an important role when evaluating new ideas, novel devices, and inhouse prototypes as part of the ongoing research and development program at the APS. The measurements will be performed with both moving search coils and moving Hall probes. The IDs will be evaluated by computer modeling of the emitted radiation for any given (measured) magnetic field map. The quality of the magnetic field will be described in terms of integrated multipoles for the effect on Storage Ring performance and in terms of the derived trajectories for the emitted radiation. Before being installed on the Storage Ring, every device will be measured and characterized to assure that it is compatible with Storage Ring requirements and radiation specifications. The accuracy that the APS needs to achieve for magnetic measurements will be based on these specifications.

24339 (ANL/ASD/RP–79396) **Fundamental mode rf power dissipated in a waveguide attached to an accelerating cavity.** Kang, Y.W. Argonne National Lab., IL (United States). 9 Feb 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93011758. Source: OSTI; NTIS; INIS; GPO Dep.

An accelerating RF cavity usually requires accessory devices such as a tuner, a coupler, and a damper to perform properly. Since a device is attached to the wall of the cavity to have certain electrical coupling of the cavity field through the opening. RF power dissipation is involved. In a high power accelerating cavity, the RF power coupled and dissipated in the opening and in the device must be estimated to design a proper cooling system for the device. The single cell cavities of the APS storage ring will use the same accessories. These cavities are rotationally symmetric and the fields around the equator can be approximated with the fields of the cylindrical pillbox cavity. In the following, the coupled and dissipated fundamental mode RF power in a waveguide attached to a pillbox cavity is discussed. The waveguide configurations are (1) aperture-coupled cylindrical waveguide with matched load termination; (2) short-circuited cylindrical waveguide; and (3) E-probe or H-loop coupled coaxial waveguide. A short-circuited, one-wavelength coaxial structure is considered for the fundamental frequency rejection circuit of an H-loop damper.

The major SSC experiments are expected to produce up to 1 Petabyte of data per year each. Once the primary reconstruction is completed by farms of inexpensive processors. I/O becomes a major factor in further analysis of the data. We believe that the application of database techniques can significantly reduce the I/O performed in these analyses. We present examples of such I/O reductions in prototype based on relational and object-oriented databases of CDF data samples.

24341 (BNL–47434) **Time-dependent hydrogen and helium pressure profiles in a long, cryogenically cooled tube, pumped at periodic intervals.** Hobson, J.P. (National Vacuum Technologies, Inc., Ontario (Canada)); Welch, K.M. Brookhaven National Lab., Upton, NY (United States). [1992]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-921129–8: 39. national symposium of the American Vacuum Society, Chicago, IL (United States), 9-13 Nov 1992). Order Number DE93013340. Source: OSTI; NTIS; INIS; GPO Dep.

Many particle accelerators and colliders throughout the world make use of superconducting magnets to focus highly relativistic beams. These magnets are cooled to ~4.2°K For practical reasons, the beam pipes, encircled by the magnets, also operate at these cryogenic temperatures. This paper presents a theoretical model for determining pressure profiles, in space and time, stemming from either hydrogen or helium gas leak into the cold-bore tube with appendage pumps located at periodic intervals. It is shown that a wave-like pressure gradient propagates from the leak source at a rate which is dependent on the leak magnitude, gas species, speed and location of appendage pumps, and the geometry and effective roughness of the cold-bore tube. Steady-state, linear pressure gradients eventually equilibrate between the appendage pumps in a magnitude commensurate with both the adsorption isotherm of the species and mass flow in the beam pipe. Results are given for a variety of conditions relevant to the Relativistic Heavy Ion Collider being constructed at Brookhaven, and a general procedure, with expressions, is provided for the making of similar calculations in other installations.

24342 (BNL–47435-Rev.3/93) **The pumping of hydrogen and helium by sputter-ion pumps: Revision 3/93.** Welch, K.M.; Pate, D.J.; Todd, R.J. Brookhaven National Lab., Upton, NY (United States). [1992]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-921129–9-Rev.3/93: 39. national symposium of the American Vacuum Society, Chicago, IL (United States), 9-13 Nov 1992). Order Number DE93012529. Source: OSTI; NTIS; INIS; GPO Dep.

The pumping of hydrogen in diode and triode sputter-ion pumps is discussed. The type of cathode material used in these pumps is shown to have a significant impact on the effectiveness with which hydrogen is pumped. Examples of this include data for pumps with aluminum and titanium-alloy cathodes. Diode pumps with aluminum cathodes are shown to be no more effective in the pumping of hydrogen than in the pumping of helium. The use of titanium or titanium alloy anodes is also shown to measurably impact on the speed of these pumps at.very low pressures. This stems from the fact that hydrogen is $\times 10^6$ more soluble in titanium than in stainless steel. Hydrogen becomes resident in the anodes because of fast neutral burial. Lastly, quantitative data are given for the He speeds and capacities of both noble and conventional diode and triode pumps. The effectiveness of various pump regeneration procedures, subsequent to the pumping of He, is reported.These included bakeout and N_2 glow discharge cleaning. The comparative desorption of He with the subsequent pumping of N_2 is reported on. The N_2 speed of these pumps was used as the benchmark for defining the size of the pumps vs. their respective He speeds.

24343 (BNL–48230) **The AGS-Booster complex for the g-2 experiment and RHIC injection.** Tanaka, Mitsuyoshi; Lee, Yong Y. Brookhaven National Lab., Upton, NY (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930511–123: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014305. Source: OSTI; NTIS; INIS; GPO Dep.

The delivery of a beam with characteristics appropriate for the g-2 muon storage ring and the filling of the RHIC heavy ion collider from the AGS main ring requires a new fast extracted beam (NewFEB) system. The NewFEB system must be capable of performing single bunch multiple extraction of a heavy ion beam, as well as a high intensity proton beam at a time interval of 25 ms up to 12 times per AGS cycle. The new system will consist of a fast multipulsing kicker and an ejector septum magnet with local orbit bumps.

Impressions of laser-driven photocathode R&D and RF e^- guns at the LAL. Discussions of photoelectron energy analysis and of some facilities at the CEN Saclay Laser Interaction Lab. Photoemission in theory and practice, including ion implantation of cathodes at the University of Claude Bernard in Lyon. Photocathode R&D and CLIC facility at CERN. Selected impressions and progress reported at the e^+-e^- Collider Workshop in Garmisch, Germany. Copy of transparencies of some presentations are included.

24345 (CONF-9206193–25) **Experimental gyroklystron research at the University of Maryland for application to TeV linear colliders.** Lawson, W.; Granatstein, V.L.; Hogan, B.; Koc, U.V.; Latham, P.E.; Main, W.; Matthews, H.W.; Nusinovich, G.S.; Reiser, M.; Striffler, C.D.; Tantawi, S. Maryland Univ., College Park, MD (United States). [1992]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-91ER40642. From Advanced accelerator concepts workshop; Port Jefferson, NY (United States); 14-20 Jun 1992. Order Number DE93010174. Source: OSTI; NTIS; INIS; GPO Dep.

X-Band and K-Band gyroklystrons are being evaluated for possible application to future linear colliders. So far we have examined the different two- and three-cavity configurations. We have achieved a maximum peak power of 27 MW in ~1 μs pulses at a gain of 36 dB and an efficiency exceeding 32%. The nominal parameters include a 430 kV. 150–200 A beam with an average perpendicular to parallel velocity ratio near one. In this paper, we detail our progress to date and describe our plans for future experiments that should culminate in amplifier outputs in excess of 100 MW in 1 μs pulses.

24346 (DOE/FTR–93011935) **[Travel to the Heavy Ion Research Center and the Nuclear Research Center, Germany and the conference on physics of high energy density in matter, Austria]: Foreign trip report, January 24, 1993–February 7, 1993.** Mehlhorn, T.A.; Slutz, S.A. Sandia National Labs., Albuquerque, NM (United States). 18 Mar 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93011935. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The trip was from January 24 to February 7, 1993. The primary purpose was to present at the Hirschegg Conference the invited papers "Target experiments at the petawatt/g level at Sandia National Laboratories" by T. Mehlhorn and "Theory of high current density multistage acceleration" by S. Slutz. The intense ion beams and the interaction of such ion beams with matter. A synopsis of each visit is included.

24347 (FNAL/C–92-239) **Magnetic field properties of SSC model dipole magnets.** Wake, M. (Fermi National Accelerator Lab., Batavia, IL (United States)); Bossert, R.; Carson, J.; Delchamps, S.; Jaffery, T.S.; Kinney, W.; Koska, W.; Lamm, M.J.; Strait, J.; Butteris, J.; Sims, R.; Winters, M. Fermi National Accelerator Lab., Batavia, IL (United States). Sep 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-920315–46: 3. European particle accelerator conference (EPAC-3): Accelerators for special applications, Berlin

(Germany), 24-28 Mar 1992). Order Number DE93013567. Source: OSTI; NTIS; INIS; GPO Dep.

SSC 1.5m model dipole magnets were built and tested at Fermilab. Magnetic field properties were studied in term of transfer function variation and multipole components. The results were satisfactory. Observation of periodicity of remanent field along the axis is also reported.

24348 (FNAL/C–92/308) **The Dv software trigger.** Linnemann, J.T. (Fermi National Accelerator Lab., Batavia, IL (United States)). For the DO Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Oct 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-920966–26: 10. conference on computing in high energy physics, Annecy (France), 21-25 Sep 1992). Order Number DE93014030. Source: OSTI; NTIS; INIS; GPO Dep.

In the Dv experiment, the software filter operates in a processor farm with each node processing a single event. Processing is data-driven: the filter does local processing to verify the candidates from the hardware trigger. The filter code consists of independent pieces called "tools"; processing for a given hardware bit is a "script" invoking one or more "tools" sequentially. An offline simulator drives the same code with the same configuration files, running on real or simulated data. Online tests use farm nodes parasiting on the data stream. We discuss the performance of the system and how we attempt to verify its correctness.

24349 (IFVE-OLU–90-131) **Work on RF superconducting cavities done at Institute for High Energy Physics: 1. Experimental technological equipment.** Sevryukova, L.M. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1990. [25p.] (In Russian). Order Number DE93626165. Source: OSTI; NTIS (US Sales Only); INIS.

The paper describes the complex of experimental technological equipment exploited for the manufacturing, treatment and study of superconducting cavities. The complex incorporates the necessary technological, measuring and cryogenic equipment enabling one to manufacture copper superconducting cavities without welding seams with further applying superconducting films onto their working surfaces. 14 refs.; 23 figs.

24350 (IHEP-OEF–90-81) **Experiments on hyperon beam of UNK.** Garkusha, V.I. (and others); Golovkin, S.V.; Gorin, A.M. Collaboration. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1990. [87p.] (IFVE-OEF–90-81.). Order Number DE93626176. Source: OSTI; NTIS (US Sales Only); INIS.

The experimental program for the UNK hyperon beams is considered. It is expected, that a focused pure Σ^-hyperon beam with P$\simeq$2700 GeV/c, intensity $>10^7$ Σ^-/s and >85% of Σ^- hyperons may be created in this machine. The magnetized iron shielding will allow one to reduce the muon halo by 2 orders of magnitude. The experiments on the study of strange-charmed and strange-beauty baryons, search for exotic states with strangeness and charm and cryptoexotic strange hadrons with hidden charm and beauty are discussed. The possibilities of the hyperon beam for these processes are unique. Future studies of hyperon form-factors and structure functions of the processes in the nuclear Coulomb field, rare decays of charmed and beauty particles, τ-leptons and hyperons are also considered. 42 refs.; 28 figs.; 17 tabs.

24351 (INIS-RU–343, pp. 19-22) **Ion injector beam potential.** Demchenko, P.A. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Yashin, P.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i; AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1991. [80p.] (In Russian). In *Nuclear-physical researches (Theory and experiment): Scientific-technical collection.* Order Number DE93626131. Source: OSTI; NTIS (US Sales Only); INIS.

The article presents the description of equipment and results of measuring the potential of space charge of proton beams produced in a high-current pulse injector of linear accelerator. Ion beam energy was 100 keV, current - about 50 mA at 1 ms duration. Potential measurements are based on the method of thermal probe and analysis of energy spectra of residual gas ions generated in collisions with beam particles. It is ascertained that under certain boundary conditions space beam charge in drift space is compensated to a significant extent with residual gas ionization electrons, the value of their potential is in agreement with applicable theoretical models. Electron purification of beams with external electrode electric fields results in a growth of the potential up to expected vacuum values. Such being the case, their divergence and dimensions are increasing under impact of space charge field resulting in a specific evolution of cross sections of beam phase space. 7 refs.; 4 figs.

24352 (INIS-RU–343, pp. 37-39) **Maximum water purity in cooling systems of electrophysical equipment.** Zarubin, B.T. (AN SSSR, Moscow (Russian Federation). Missing values of the rates of highly demineralized water contamination with copper and stainless steel are determined experimentally; these values are required for calculating cooling systems of electrophysical equipment. Usefulness of the data and calculation formulae used have been proved experimentally at the 200 kW operating high-frequency channel and copper cavity of linear proton accelerator. 4 refs.

24353 (INIS-RU–343, pp. 43-44) **Calculation of characteristics of diaphragmatic waveguide with different period.** Ajzatskij, N.I. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Volobuev, V.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i; AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1991. [80p.] (In Russian). In *Nuclear-physical researches (Theory and experiment): Scientific-technical collection.* Order Number DE93626131. Source: OSTI; NTIS (US Sales Only); INIS.

Within the scope of the project of a high current ($\approx$50 A) short-pulse ($\approx$10 ns) electron accelerator development in the Kharkov Physics and Engineering Institute, it was proposed to use a ring diaphragmatic waveguide as the accelerating section; transition to the acceleration of the reverse wave, whose phase velocity is equal to light velocity, by the first space harmonic has been accomplished by increasing space period of the structure in the waveguide. Calculations of waveguide electrodynamic characteristics depending on structure's period value were performed to establish application capabilities of such waveguides. The calculation results show that transition to the sections with accelerating wave phase carry over in the period lying in π-2π interval allows to increase the accelerated beam charge. 4 refs.; 2 tabs.

24354 (INIS-RU–343, pp. 32-34) **Production of polarized electron beam from dielectrics surface.** Efimov, V.P. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Zakutin, V.V.; Shenderovich, A.M. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i; AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1991. [80p.] (In Russian). In *Nuclear-physical researches (Theory and experiment): Scientific-technical collection.* Order Number DE93626131. Source: OSTI; NTIS (US Sales Only); INIS.

A method is proposed for producing polarized electron beams through accumulation of nonpolarized electrons on the surface of dielectric, relaxation of their spins in a magnetic field and subsequent detachment of polarized electrons from the surface by the electric field. The proposed method can be implemented even at

room temperatures. For this purpose, electrons shall accumulate on the surface of ferrodielectric with cubic crystalline lattice. In this case an electron beam can be produced with pulse current of ≃100 mA and polarization degree of about 80%. 3 refs.; 2 figs.

24355 (INIS-RU–343, pp. 30-31) **Polarized electron beam production for a linear accelerator by the method of electron beam shock ionization of polarized hydrogen.** Efimov, V.P. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i; AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1991. [80p.] (In Russian). In *Nuclear-physical researches (Theory and experiment): Scientific-technical collection.* Order Number DE93626131. Source: OSTI; NTIS (US Sales Only); INIS.

For short-pulse operation of a resonance electron linac, it is proposed to use an accelerating section based on ring diaphragmatic waveguide with a large angle of particle flight ($\Theta \simeq \omega_0 D/c > \pi$). Particle flight angle is increased through sparser disposition of diaphragms. Such being the case, phase velocity of the first harmonic of accelerating field will exceed velocity of light, therefore, HF-energy is supplied to the section through outlet matching device, and electron acceleration is performed by the first space harmonic of on-coming wave. It is shown that $\Theta > \pi$ transition allows to increase an ultimate accelerated charge while decreasing average acceleration rate. The last disadvantage can be compensated through regeneration or HF-pulse compression system. 4 refs.; 2 figs.

In *Nuclear-physical researches (Theory and experiment): Scientific-technical collection.* Order Number DE93626131. Source: OSTI; NTIS (US Sales Only); INIS.

A theory of axially homogeneous oscillations of a ring resonator with conducting walls is resolved; the resonator is loaded with infinitely thin cylindric diffraction grating which is coaxial to the enclosure. The problems of finding the spectra of accelerating (p=0) and defocusing (p=±1) types of TM_{pqo} oscillations of the resonator is reduced by the method of Agranovich-Marchenko-Shestopalov to the solution of infinite systems of homogeneous algebraic equations with rapidly decreasing coefficients. 1 ref.

24359 (INIS-RU–343, pp. 23-26) **Application of H(2s) atom photoionization electrons for measuring energy of H^- ion beam.** Artemov, A.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Sukhumi (Russian Federation). Fiziko-Tekhnicheskij Inst.). Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i; AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1991. [80p.] (In Russian). In *Nuclear-physical researches (Theory and experiment): Scientific-technical collection.* Order Number DE93626131. Source: OSTI; NTIS (US Sales Only); INIS.

A method is proposed for measuring energy spectrum of H^- ion beam at the bending sections of its transport channel; the method relies on utilization of H(2s) stripping atoms and electrons of their photoionization. A compact device is proposed for implementation of the method in the high ion energy region. Basic parameters of the device are calculated for non-exciting control of H^- ion beam energy spectrum at the charge-exchange section of $H^- \rightarrow P$ injection into the proton storage ring of the Moscow meson factory. 14 refs.; 2 figs.

24360 (INIS-RU–343, pp. 35-36) **Protection system of electron linac accelerating structures.** Abrosimov, V.T. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Vasil'ev, E.P.; Mufel', V.B.; Tur, Yu.D. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i; AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1991. [80p.] (In Russian). In *Nuclear-physical researches (Theory and experiment): Scientific-technical collection.* Order Number DE93626131. Source: OSTI; NTIS (US Sales Only); INIS.

A system of electron linac accelerating structure protection is described; the system is based on the principle of comparison of SHF enveloping signals at the inlet and outlet of the section. Its efficiency and applicability as an analyzer of optimal conditions of electron beam acceleration are assessed. The check of the protection system shows that high sensitivity of its comparator circuits ensures high efficiency of indication of RF breakdowns and disturbance of beam acceleration conditions in the accelerating structure with high acceleration. 3 refs.; 2 figs.

24361 (JINR–9-90-165) **Programmes for determination of the parameters of the power supply stabilization system on the electronic cyclotron model/EMKC/.** Kalmykov, A.V.; Borisova, M.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1990. [5p.] (In Russian). Order Number DE93626170. Source: OSTI; NTIS (US Sales Only); INIS.

The paper describes the WES programme which determines the weight of the low-order bit for the current specification channel, taking into account all errors due to elements of the current stabilization system. The programme ZDT is described, it is the core of the programmes used for specifying and measuring current in the coils of the magnet system. 3 refs.; 6 figs.

24362 (JINR-E–1-92-8) **Crystal deflector for relativistic ion colliders.** Kovalenko, A.D.; Taranin, A.M.; Tsyganov, E.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of

High Energy. 1992. [11p.] Order Number DE93626162. Source: OSTI; NTIS (US Sales Only); INIS.

Extracted ion beams for fixed target experiments can be provided as a by-product at unique multi-GeV ion colliders by means of bent crystal channeling. The main quaestions in this connection are discussed. Results on efficiency of ion beam deflection and extraction are presented. Calculations on a possible extracted 100-GeV, Au-beam parameters for RHIC were made. 16 refs.; 2 figs.

24363 (JINR-E–9-91-383) **The multiply charged ion production in ECR ion sources.** Shirkov, G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1991. [7p.] Order Number DE93626155. Source: OSTI; NTIS (US Sales Only); INIS.

The ion confinement and loss conditions in the open magnetic traps have been analyzed in this article. In EGRIS the ions are confined in the negative potential well. The large output pulse of multiply charged ions in the RF pulse mode is explained. MINI-MAFIOS type EGRIS have been carried out. Some other ways are proposed to obtain the pulse beams of multiply charged ions in EGRIS. 10 refs.; 3 figs.

24364 (JINR-E–9-92-33) **Fundamental processes determining the highly charged ion production in ECR ion sources.** Shirkov, G.D. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1992. [11p.] Order Number DE93626156. Source: OSTI; NTIS (US Sales Only); INIS.

The ion confinement and loss conditions in the open magnetic traps have been analyzed in this article. In EGRIS the the ions are confined in the negative potential well. The simultaneous application of ion cooling and pulse regime is proposed for pulse injection of highly charged ions in heavy ion accelerators and storage rings. 14 refs.; 3 figs.

24365 (JINR-R–9-91-355) **A cryogenic vacuum pump for the linear accelerator.** Vasilishin, B.V.; Kulikov, I.I.; Pazhentsev, A.N.; Pikin, A.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1991. [4p.] (In Russian). Order Number DE93626168. Source: OSTI; NTIS (US Sales Only); INIS.

The oiless pumping of Linac LU-20 is described. The vacuum pumping is provided with the cryopump that includes a cryopanel that includes a cryopanel inside the radiation shield. Data acquisition and processing system is based on the MERA-60 computer and the electronics of CAMAC ctandard. The cryopump improved vacuum in Linac to $6X10^{-7}$ Torr (the initial vacuum was $2.5X10^{-6}$ Torr). 5 refs.; 1 figs.; 1 tab.

24366 (JINR-R–9-92-14) **Second harmonic phase stabilization system.** Akkuratov, V.A.; Grazov, A.A.; Novikov, D.L. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1992. [4p.] (In Russian). Order Number DE93626169. Source: OSTI; NTIS (US Sales Only); INIS.

The circuit units stabilizing the phase of the second harmonic with respect to the first one in the flat-top accelerating regime with a +-0.5 accuracy at the first harmonic frequency 39.609 MHz are presented. These units were used during used during experimental research of the closed orbit expansion effect on the electron model of the ring cyclotron. 4 refs.; 4 figs.

24367 (JINR-R–9-92-37) **The pulse TEA CO_2 laser for a laser ion source.** Kalagin, I.V.; Monchinskij, V.A.; Salimov, Eh.Kh. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1992. [7p.] (In Russian). Order Number DE93626158. Source: OSTI; NTIS (US Sales Only); INIS.

The detailed description of the pulse TEA CO_2 laser with an ultraviolet preionization of a gas mixture, meaning for a laser ion source is given. The excitement of the laser is carried out by the powerful generator (modulator) with a time compression of an electromagnetic energy by means of using the nonlinear power amplification circuits. The laser has the following performances: the output energy is 13 J per pulse, the half height time of the giant pulse is about 100 ns, the beam divergence is $5X1-^{-3}$ rad, the work frequency up to 1 Hz. 9 refs.; 7 figs.

24368 (JINR-R–13-91-295) **Current transducer for the power supply of the main coil of the iron-current channel at the JINR phasotron.** Batmanova, Eh.K.; Kazakova, G.G.; Kalinichenko, V.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1991. [6p.] (In Russian). Order Number DE93626166. Source: OSTI; NTIS (US Sales Only); INIS.

A direct current transducer of current rating 12.5 kA is discussed. The conversion error is 10^{-3}. The transducer comprises a cascade first and second measuring direct-current conversion based on magnetic comparison of direct currents. The principle of operation of the transducer is considered, its block-diagram and the block-diagram of the first measuring DC converter are given. The circuit diagram of the magnetic modulation unit of the measuring DC converter is presented. 6 refs.; 3 figs.

24369 (JINR-R–13-91-317) **An ungrounded power supply using superconductors.** Romanov, Yu.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1991. [7p.] (In Russian). Order Number DE93626157. Source: OSTI; NTIS (US Sales Only); INIS.

Basic requirements imposed in the power supplies of fiber optical lines used to operate in control systems of highvoltage electrophysical setups are formulated. Systematization on the existing methods of construction of ungrounded power supplies (UPS) is briefly described. A practical scheme of UPS using suoercondensers is given. Its technical characteristics are presented. 9 refs.; 3 figs.

24370 (JINR-R–13-91-406) **Upgrading of the power supply complex for correcting winding of the U-12CM cyclotron.** Batmanova, Eh.K.; Denisov, Yu.N.; Kazakova, G.G.; Kalinichenko, V.V.; Krzhivanek, M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1991. [7p.] (In Russian). Order Number DE93626167. Source: OSTI; NTIS (US Sales Only); INIS.

The complex of power supply units for the correcting windings of the U-12OM cyclotron comprises 20 wide-range direct current stabilizes with current rating 400-600 A. The aim of the upgrading is to increase reliability and to simplify operation, which is achieved by using modern circuitry and new technological solutions. 4 refs.; 4 figs.

24371 (LA-SUB–93-63) **DARHT operations and maintenance manual.** Los Alamos National Lab., NM (United States); Pulse Sciences, Inc., San Leandro, CA (United States). Dec 1991. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93008819. Source: OSTI; NTIS; GPO Dep.

The Dual Axis Radiographic Hydrodynamic Test (DARHT) injector system was designed, constructed and tested in the dummy load configuration at Pulse Sciences, Inc. (PSI), San Leandro, CA for Los Alamos National Laboratories (LANL) during the period from September 1989 through December 1990. The injector was installed and its operation was demonstrated in the dummy load configuration at LANL from January 1991 through April 1991. Testing of the system configuration into a diode load began in June 1991. Cross-sectional views of the injector in both the dummy load and system configurations are shown. The injector is designed to produce a 4 MV, flat-top (± 1%), 65 nsec (99–99%) acceleration pulse into a 150 ohm load with a command fire jitter of less than 3 nsec (3σ). The load consists of an adjustable sodium thiosulfate solution resistor located at the vacuum tube interface in parallel with an ~1 kΩ electron beam diode. This manual describes the injector and its ancillary systems and gives operating, maintenance and assembly instructions for the system in the dummy load configuration.

24372 (LA-UR–93-1517) **Beam position monitoring in the 100-MHz to 500-MHz frequency range using the log-ratio technique.** Wells, F.D.; Shafer, R.E.; Gilpatrick, J.D. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–6: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93012742. Source: OSTI; NTIS; GPO Dep.

A logarithmic-ratio beam position monitor (BPM) circuit has been designed that operates directly from radio frequency- signals in the 100-MHz to 500-MHz frequency range. The circuit uses four logarithmic amplifiers, a pair for each channel. One amplifier per

channel receives its signal input directly from a BPM electrode while the second amplifier receives the same signal attenuated by 7-dB. The two outputs of each channel are summed together and the composite video outputs are applied to a differencing amplifier. The net result is the logarithmic-ratio position measurement derived from the two input rf signals. Paralleling the pairs of outputs from the amplifiers provides measurement accuracy that is comparable to other circuit techniques used for position measurement.

24373 (LA-UR–93-1873) **Operational characteristics of a 100-mA, 2-MeV radio-frequency quadrupole.** Johnson, K.F.; Cottingame, W.B.; Bolme, G.O.; Fortgang, C.M.; Ingalls, W.B.; Marquardt, J.; Rusthoi, D.P.; Sander, O.R.; Smith, M.; Worth, G.T. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–47: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014474. Source: OSTI; NTIS; INIS; GPO Dep.

A 100-mA, 2.07-MeV Radio-Frequency Quadrupole (RFQ III) has been commissioned and operated routinely on the Accelerator Test Stand (ATS) [1] at Los Alamos National Laboratory. To characterize the RFQ output beam dynamics, measurements were made of the beam transmission and of the transverse and longitudinal phase-space distributions. Data were taken for different RFQ III operating conditions and compared to simulations.

24374 (LA-UR–93-1903) **Hydrodynamic calculations of 20-TeV beam interactions with the SSC beam dump.** Wilson, D.C. (Los Alamos National Lab., NM (United States)); Wingate, C.A.; Goldstein, J.C.; Godwin, R.P.; Mokhov, N.V. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–44: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014463. Source: OSTI; NTIS; INIS; GPO Dep.

The 300 μs, 400 MJ SSC proton beam must be contained when extracted to the external beam dump. The current design for the SSC beam dump can tolerate the beat load produced if the beam is deflected into a raster scan over the face of the dump. If the high frequency deflecting magnet were to fail, the beam would scan a single strip across the dump face resulting in higher local energy deposition. This could vaporize some material and lead to high pressures. Since the beam duration is comparable to the characteristic time of expected hydrodynamic motions, we have combined the static energy deposition capability of the MARS computer code with the two- and three-dimensional hydrodynamics of the MBA and SPHINX codes. EOS data suggest an energy deposition threshold of 15 kJ/g, below which hydrodynamic effects are minimal. Above this our 2D calculations show a hole boring rate of 7 cm/μs for the nominal beam, and pressures of a few kbar. Scanning the nominal beam faster than 0.08 cm/μs should minimize hydrodynamic effects. 3D calculations support this.

24375 (LA-UR–93-1947) **Funneling experience at Los Alamos: Experiments and designs.** Jason, A.J.; Johnson, K.F.; Nath, S. Los Alamos National Lab., NM (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9305177–6: 12. International collaboration of advanced neutron sources meeting (ICANS), Abingdon (United Kingdom), 24-28 May 1993). Order Number DE93014357. Source: OSTI; NTIS; GPO Dep.

Modern linacs are capable of accelerating high-current low-emittance beams input above a minimum energy. However, the ability of ion sources to produce such beams and the ability of low energy structures to accelerate high currents to this minimum energy is lacking. Funneling is a method of combining two or more beams to overcome this limitation. It is very important to note that the phase space of the two beams to be combined is not merged, in violation of Liouville's theorem. Instead beam micropulses from two sources are interleaved in time. It is also important to note that the micropulse frequency has doubled over that of the separate sources and must be accommodated by the linac following the funnel. Thus if the two funneled beams were accelerated by 400 MHz linacs, further acceleration must be done by an 800 MHz (or higher) linac. Other concepts are possible, but the authors concentrate on the one presented as the most feasible. The presence of both longitudinal and transverse focusing elements are crucial to device performance, as are adequate diagnostic elements. To attain the high peak currents needed for Los Alamos projects, such as the Ground Test Accelerator (GTA), Accelerator Production of Tritium (APT), Accelerator Transmutation of Waste (ATW), or the 5 MW upgrade to the National Center for Neutron Research (NCNR), a funneling scheme is needed. In these projects the authors consider funneling of two beams with peak currents of up to 100 mA and transverse emittances of the order of 0.02π cm mrad, rms normalized. This article discusses a funneling experiment done at Los Alamos and briefly mentions a program at another institution that has demonstrated the concept. The authors will also discuss the funnel design for APT, now undergoing conceptual design.

24376 (LA-UR–93-2040) **Polarization diagnostics and optical pumping development for OPPIS and LAMPF.** Swenson, D.R.; Tupa, D.; York, R.L.; Dulick, M.; van Dyck, O.B. Los Alamos National Lab., NM (United States). 21 May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930544–1: Conference on polarized ion sources and polarized gas targets, Madison, WI (United States), 23-27 May 1993). Order Number DE93014390. Source: OSTI; NTIS; INIS; GPO Dep.

We report improvement of the polarization diagnostics and their use in the development of the Optically Pumped Polarized Ion Source (OPPIS).

24377 (LBL–32480) **Theoretical examination of transfer cavities in a standing-wave free- electron laser Two-Beam Accelerator.** Govil, R.; Sessler, A. Lawrence Berkeley Lab., CA (United States). Jan 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (ESG–198;CONF-930159–29: OE/LASE '93: International Society for Optical Engineering (SPIE) conference, Los Angeles, CA (United States), 16-23 Jan 1993). Order Number DE93010462. Source: OSTI; NTIS; INIS; GPO Dep.

Recent analysis of the Two-Beam Accelerator (TBA) by Wurtele, Whittum and Sessler has shown that the transfer cavities, both in the relativistic klystron version (RK/TBA) and the standing-wave free-electron laser version (SWFEL/TBA), can be characterized by a simple coupling impedance. In the two cases the radiation process is very similar: Only the modes that couple to the electron beam are different. As a result, computer programs that are able to handle realistic cavities (with beam ports and coupling ports, etc.) can be employed to evaluate the performance of either version of the TBA. We have employed the code URMEL to study the proper coupling impedance for a number of realistic cavities for a SWFEL.

24378 (NIIEFA-P-V–0852) **Countercurrent converters for beam current measurement and determination of the position of its center of gravity in a induction linear accelerator.** Demskij, M.I.; Trifonov, D.E.; Ul'yanov, V.I. Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (Russian Federation). 1990. [8p.] (In Russian). Order Number DE93626177. Source: OSTI; NTIS (US Sales Only); INIS.

Consideration is given to main choosing criteria and calculation relations for current transformers, used in countercurrent converters at beam current pulse durations, typical for induction linear accelerators. Three versions of design of countercurrent transducers with current transformers are analyzed. Merits and demerits of the designs are shown. 2 refs.; 4 figs.

24379 (ORNL/FTR–4284) **Travel to Italy to participate in a particle accelerator conference: Foreign trip report, May 30, 1992–June 6, 1992.** Jones, N.L. Oak Ridge National Lab., TN (United States). 17 Jun 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011066. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended the Sixth International Conference on Electrostatic Accelerators and Associated Boosters, and presented a poster on "Improved Voltage Gradient Control System For Electrostatic Accelerators." Papers of particular interest to the ORNL atomic physics program involved the acceleration of carbon

clusters, computer modeling of Bremsstrahlung radiation from accelerator tubes, and cooled ion beam physics. One session of the conference, conducted at Laboratori Nazionali di Legnaro, included a tour of the 15 million volt XTU Tandem accelerator and the booster linac which is still under construction.

24380 (SLAC-PUB–6060) **Polarized source performance in 1992 for SLC–SLD.** Schultz, D.; Alley, R.; Clendenin, J.; Frisch, J.; Garden, C.; Hoyt, E.; Klaisner, L.; Kulikov, A.; Prescott, C.; Saez, P.; Tang, H.; Turner, J.; Wicks, M.; Woods, M.; Yeremian, D.; Zolotorev, M. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Feb 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-921131–11: 10. international symposium on high-energy spin physics, Nagoya (Japan), 9-14 Nov 1992). Order Number DE93010951. Source: OSTI; NTIS; INIS; GPO Dep.

In its initial operation, the SLC Polarized Electron Source successfully met the SLC goals for 1992 for intensity and efficiency. However, the stability of the beam at the source was marginal, and the polarization was only ~28%. The SLC goal to provide > 10,000 Z events for the SLD from polarized electrons was met.

24381 (SLAC-PUB–6061) **Exploiting periodicity and other structural symmetries in field solvers.** Nelson, E.M. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Feb 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-930269–11: Computational accelerator physics conference (CAP93), Pleasanton, CA (United States), 22-26 Feb 1993). Order Number DE93010952. Source: OSTI; NTIS; INIS; GPO Dep.

Many RF structures have symmetries which can be exploited by field solvers with appropriate boundary conditions. These symmetries allow a reduced problem to be solved, which leads to faster and/or more accurate solutions. Of particular interest to the accelerator community are periodic structures. Quasi-periodic boundary conditions allow modes with any desired phase advance given a single cell of the periodic structure. For symmetric periodic structures there is a variation which requires only a half cell of the periodic structure. These boundary conditions can also be used for rotationally periodic structures, such as cross-field amplifiers and magnetrons. Boundary conditions for some other symmetries, such as reflection symmetry about a plane and about a point, will also be reviewed.

24382 (SLAC-PUB–6067) **Modelling RF sources using 2-D PIC codes.** Eppley, K.R. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Mar 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-930269–10: Computational accelerator physics conference (CAP93), Pleasanton, CA (United States), 22-26 Feb 1993). Order Number DE93010954. Source: OSTI; NTIS; INIS; GPO Dep.

In recent years, many types of RF sources have been successfully modelled using 2-D PIC codes. Both cross field devices (magnetrons, cross field amplifiers, etc.) and pencil beam devices (klystrons, gyrotrons, TWT'S, lasertrons, etc.) have been simulated. All these devices involve the interaction of an electron beam with an RF circuit. For many applications, the RF structure may be approximated by an equivalent circuit, which appears in the simulation as a boundary condition on the electric field ("port approximation"). The drive term for the circuit is calculated from the energy transfer between beam and field in the drift space. For some applications it may be necessary to model the actual geometry of the structure, although this is more expensive. One problem not entirely solved is how to accurately model in 2-D the coupling to an external waveguide. Frequently this is approximated by a radial transmission line, but this sometimes yields incorrect results. We also discuss issues in modelling the cathode and injecting the beam into the PIC simulation.

24383 (SSCL–619) **Submicron beam position sensor for the SSC.** Tsyganov, E.; Kauffmann, S.; Meinke, R.; Nexsen, W.; Richardson, R. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE93013943. Source: OSTI; NTIS; INIS; GPO Dep.

A submicron-accuracy beam position monitor for the Superconducting Super Collider accelerators is proposed, based on use of a low-energy electron beam probe. The resolution of the probe is estimated.

24384 (SSCL-Preprint–203) **An experimental evaluation of joint electrical resistance on power lead thermal performance.** Datskov, V.I.; Demko, J.A.; Augustynowicz, S.D.; Hutton, R.D. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–10: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93012306. Source: OSTI; NTIS; INIS; GPO Dep.

The amount of electrical resistance in braze joints is not known for certain. In addition annealing processes that occurs during a braze or solder operation can change the residual resistivity ratio (RRR) of the copper. The change in the electrical resistivity of samples of copper because of exposure to conditions that a high current lead would see during a brazing operation were experimentally investigated. A sample was taken from a manufacturing and brazing trial of the high current power leads for the Superconducting Super Collider (SSC), and from oxygen free high conductivity copper (OFHC) 101 rod similar to that used in the trial. The samples were heated under conditions that a current lead would undergo during the brazing process. Measurements were made of the electrical resistance of the copper specimens and across abraze joint in the manufacturing trial sample for temperatures ranging from liquid helium to room temperature.

24385 (SSCL-Preprint–208) **Systems analysis determining critical items, critical assembly processes, primary failure modes and corrective actions on ASST magnets.** Arden, C.S. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–2: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93012305. Source: OSTI; NTIS; INIS; GPO Dep.

During the assembly process through the completion of the Accelerator Surface String Test (ASST) phase one test, Magnet Systems Division Reliability Engineering has tracked all the known discrepancies utilizing the Failure Reporting, Analysis and Corrective Action System (FRACAS) and data base. This paper discusses the critical items, critical assembly processes, primary failure modes and corrective actions (lessons learned) based on actual data for the ASST magnets. The ASST magnets include seven Brookhaven Lab Dipoles (DCA-207 through 213), fourteen Fermi Lab Dipoles (DCA-310 through 323) and five Lawrence Berkeley Lab Quadrupoles (QCC-402 through 406). Between all the ASST magnets built there were one hundred eighty six (186) class one discrepancies reported out of approximately eleven hundred total discrepancy reports. The class one or critical discrepancies are defined as form, fit, function, safety or reliability problem. Each and every ASST magnet is considered a success, as they all achieved the quench performance requirements and were capable of being incorporated into the string test. This paper also discuss some specific magnet discrepancies, including failure cause(s), corrective action and possible open issues.

24386 (SSCL-Preprint–210) **Stress analysis on SSC cryogenic shaft transfer line suspension system.** Zhang, B. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–11: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014073. Source: OSTI; NTIS; INIS; GPO Dep.

Short communication. SUPERCONDUCTING SUPER COLLIDER/refrigerating machinery; SUPPORTS/stress analysis; REFRIGERATING MACHINERY/supports; CRYOGENICS; SUPPORTS; FINITE ELEMENT METHOD

24387 (SSCL-Preprint–215) **A study on sector nitrogen inventory emergency venting.** Zhang, B. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored

by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–6: 5. annual international industrial symposium on the super collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93012304. Source: OSTI; NTIS; INIS; GPO Dep.

The main ring of the Superconducting Super Collider consists of 10 sectors. Each sector has 4 strings and the total nitrogen inventory in a nominal string (4,320 m) is approximately 8,856 kg (2,894 gal). There are occasions when part of the collider nitrogen inventory needs to be vented in an emergency fashion. Due to the large quantity of the nitrogen inventory and the high elevation differential between the below-ground collider ring and the above-ground vent stack, it is essential to vent the nitrogen inventory in the vapor phase. Uninsulated dump tanks are provided at all sites to collect and vaporize liquid nitrogen expelled from the strings. Vapor nitrogen is then vented through a vent stack at surface level into the atmosphere. An emergency venting starts when a remote control valve in the nitrogen subcooler box opens. The string nitrogen inventory is then discharged into the dump tank. Around 100 kg nitrogen inventory will be discharged before the string inventory reaches a saturation state at certain location. After that, the static heat leak into the 80 K circuit (16,250 W per string) becomes the dominating driving force to expel the nitrogen inventory. Due to the length of the string, the boil-off bubbles are localized. The mass boil-off rate is translated into a much higher mass flow rate expelled from the string. The string saturation pressure is dynamically balanced by the total pressure drop between the string and the vent stack. The capacity requirement for the nitrogen dump tank reaches the maximum when the dump tank at each site has to handle the nitrogen inventory in two strings, which is approximately 17,712 kg (5,788 gal). This work is intended to analyze the volume capacity requirement for the nitrogen dump tanks for this worst scenario. A computer program is developed to numerically simulate the emergency venting process. The string, dump tank, and venting paths are modeled individually and then linked to impose the constraints.

24388 (SSCL-Preprint–216) **Preliminary design of sector cryogenic shaft transfer line system.** Zhang, B.; Stifle, K. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–3: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93012303. Source: OSTI; NTIS; INIS; GPO Dep.

This work summarizes the preliminary design of the shaft transfer line. Operating mod dictating the design criteria are addressed. System requirements, design constraints, and results design analysis conducted on key elements are also discussed.

24389 (SSCL-Preprint–219) **Leak Checker Data Acquisition System.** Payne, J.; Gannon, J. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-9305171–1: Computational accelerator particle conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93011039. Source: OSTI; NTIS; INIS; GPO Dep.

A portable, high speed, computerized, data logging system. The primary function of this system is to collect 'Helium Readings' from mass spectrometers. This system monitors up to 14 mass spectrometers, operating from as far away as 1 kilometer, or clustered to isolate a helium leak within 20cm. Data logging enables technicians to witness the flight of the helium through the magnet string by a graphical plotting of every channel within microseconds of when the helium was released into the vacuum. The readings are used to locate vacuum leaks and provide acceptance testing of the vacuum system for a string of superconducting magnets. The secondary functions of this system are the documentation of test conditions, archiving data sets for future reference, and providing a real-time display of all channels as the string of magnets approach critical test conditions.

24390 (SSCL-Preprint–226) **Low conductivity water plants – issues of process control.** Baritchi, L.; Haenni, D. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–4: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93012301. Source: OSTI; NTIS; INIS; GPO Dep.

The SSC Laboratory will require a large number of widely distributed low conductivity water (LCW) cooling systems to support accelerator operations. In addition to designing the physical plants, plans mustbe made for control/information systems and the human organization to run them. Initial considerations in these areas are presented.

24391 (SSCL-Preprint–228) **SSCL DD2 driver port and project update.** Mestad, S.L. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–36: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014171. Source: OSTI; NTIS; INIS; GPO Dep.

A paper previously published in the 1992 ICHEP proceedings outlined the SSC's need for a high speed, high capacity tape drive to store detector data. Also described were stages and lessons learned while developing a custom device driver for the Ampex DD2 tape drive on a Silicon Graphics 4D/310. This paper updates the work on the SGI driver and describes the efforts in porting the driver to a Sun Microsystems 670 server.

24392 (SSCL-Preprint–235) **Supplier Performance Evaluation and Rating System (SPEARS).** Oged, M.; Warner, D.; Gurbuz, E. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–7: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93012299. Source: OSTI; NTIS; INIS; GPO Dep.

The SSCL Magnet Quality Assurance Department has implemented a Supplier Performance Evaluation and Rating System (SPEARS) to assess supplier performance throughout the development and production stages of the SSCL program. The main objectives of SPEARS are to promote teamwork and recognize performance. This paper examines the current implementation of SPEARS. MSD QA supports the development and production of SSCsuperconducting magnets while implementing the requirements of DOE Order 5700.6C. The MSD QA program is based on the concept of continuous improvement in quality and productivity. The QA program requires that procurement of items and services be controlled to assure conformance to specification. SPEARS has been implemented to meet DOE requirements and to enhance overall confidence in supplier performance. Key elements of SPEARS include supplier evaluation and selection as well as evaluation of furnished quality through source inspection, audit, and receipt inspection. These elements are described in this paper.

24393 (SSCL-Preprint–237) **The Accelerator Systems String Test cryogenics.** Mulholland, G.T. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–34: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014075. Source: OSTI; NTIS; INIS; GPO Dep.

The ASST magnet string cryogenic refrigeration requirements were planned around an original design and a much smaller, backup, He refrigeration system. The ASST schedule required that the backup, or Plan B, helium refrigerator provide and meet all the requirements of the milestone test. The Plan B design, layout, subsystem commissioning tests, and the performance schedule will be provided. The magnet string cryogenic system pump and purge, cooldown and warmup, central and multiple shield cooling, temperature control and subcooling, and recooler operating experience are reported. The ASST cryogenic system static performance and the dynamic provisions, response, and recovery to magnet quenches will be described.

24394 (SSCL-Preprint–244) **Quench simulation of the 40 mm aperture SSC-Quadrupole Magnet connected in series with 50 mm aperture SSC-Dipole Magnets.** Lopez, G. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–119: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014258. Source: OSTI; NTIS; INIS; GPO Dep.

The hot-spot temperature is estimated for a Collider Quadrupole Magnet (CQM) connected in series with collider Dipole Magnets (CDM's) and for a quench appearing in CQM. An active protection system is studied where all magnets except the CQM's have heaters. These heaters cause a spot quench in each of the CDM outer layer conductors. Results indicate that the scheme is safe for a total induced quench time delay of less than 230 ms.

24395 (SSCL-Preprint–245) **The longitudinal coupling impedance of a slot on the SSC Collider linear.** Thiagarajan, V. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–17: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014179. Source: OSTI; NTIS; INIS; GPO Dep.

The location of a liner inside the collider beam tube is being studied at the SSC Laboratory, in order to provide a synchrotron radiation intercept and to help enhance the vacuum. There will be wake fieldspropagating inside the liner following the beam fields incident on the pumping holes/slots on the liner. The effect of the wake fields may be expressed through coupling impedances. This paper describes a methodto evaluate the longitudinal coupling impedance of slots/holes on the liner for a large range of frequencies (0–60 GHz).

24396 (SSCL-Preprint–260) **Three-dimensional model of a liquid-cooled, low energy booster radio- frequency cavity tuner at the Superconducting Super Collider.** Ranganathan, R.; Propp, A.; Campbell, B.; Dao, B. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–14: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014247. Source: OSTI; NTIS; INIS; GPO Dep.

A three-dimensional computational heat transfer and fluid flow model was developed to analyze a forced-flow, liquid-cooled, low energy booster (LEB) radio-frequency (RF) cavity tuner concept. The results for a commercial dielectric heat transfer fluid indicated safe temperatures in the ferrite.

24397 (SSCL-Preprint–262) **Structural and thermal analysis of a solid-cooled, low energy booster, radio-frequency-cavity tuner at the Superconducting Super Collider.** Ranganathan, R.; Propp, A.; Dao, B.; Campbell, B. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–19: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014141. Source: OSTI; NTIS; INIS; GPO Dep.

A three-dimensional heat conduction and structural model was developed to analyze and optimize the design of a solid-cooled low energy booster (LEB) radio-frequency (RF) cavity tuner concept. Consideration was given to three cooling options: (1) using beryllium oxide (BeO) disks, (2) using aluminum nitride (A1N) disks and (3) using neither BeO nor AIN disks. The results indicate that solid cooling is feasible from thermal and structural viewpoints if a minimum of two BeO disks or four AIN disks are used.

24398 (SSCL-Preprint–263) **Method of fabricating a completely ordered wound coil.** Mookerjee, S.; Shen, W.; Yager, B. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–20: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014142. Source: OSTI; NTIS; INIS; GPO Dep.

An innovative four step coil winding process is under development at the Superconducting Super Collider Laboratory. This method is to be used for correction coils used in magnets for the HEB and Collider Rings of the SSC. High density, orderly wound coils with good mechanical stability and dimensional control are the end products of this technique.

24399 (SSCL-Preprint–264) **Low energy booster radio frequency cavity structural analysis.** Jones, K. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–13: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014246. Source: OSTI; NTIS; INIS; GPO Dep.

The structural design of the Superconducting Super Collider Low Energy Booster (LEB) Radio Frequency (RF) Cavity is very unique. The cavity is made of three different materials which all contribute to its structural strength while at the same time providing a good medium for magnetic properties. Its outer conductor is made of thin walled stainless steel which is later copper plated to reduce the electrical losses. Its tuner housing is made of a fiber reinforced composite laminate, similar to G10, glued to stainless steel plating. The stainless steel of the tuner is slotted to significantly diminish the magnetically-induced eddy currents. The composite laminate is bonded to the stainless steel to restore the structural strength that was lost in slotting. The composite laminate is also a barrier against leakage of the pressurized internal ferrite coolant fluid. The cavity's inner conductor, made of copper and stainless steel, is subjected to high heat loads and must be liquid cooled. The requirements of the Cavity are very stringent and driven primarily by deflection, natural frequency and temperature. Therefore, very intricate finite element analysis was used to complement conventional hand analysis in the design of the cavity. Structural testing of the assembled prototype cavity is planned to demonstrate the compliance of the cavity design to all of its requirements.

24400 (SSCL-Preprint–273) **Design and preliminary testing of the LEB extraction kicker magnet at the SSC.** Anderson, D.E.; Schneider, L.X. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–33: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014137. Source: OSTI; NTIS; INIS; GPO Dep.

The kicker magnet for extracting beam out of the Low Energy Booster is required to generate an integrated field of 0.06 T-m for 2 μs, rising from 1% to 99% of peak in $\lesssim$80 ns. Technologies for pulsed magnets of this variety, along with the engineering tradeoffs of each, will be presented. Details of the electrical design of a vacuum-insulated 25-Ω travelling-wave (TW) kicker magnet, with a 5 x 7 cm ferrite aperture, will be discussed. The results of low-voltage tests of the prototype TW magnet and a solid-core design will also be presented. Application of experimental data and design theory to the magnet design will be mentioned.

24401 (SSCL-Preprint–277) **Effective stress of a 4.2 K beam tube in a quenching collider 50 mm dipole magnet for the SSC.** Leung, K.; Shu, Q.; Snitchler, G.; Yu, K.; Zbasnik, J. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–22: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014182. Source: OSTI; NTIS; INIS; GPO Dep.

Two mechanical design requirements are defined for the SSC Collider beam tube. First, the vacuum requirement (luminosity lifetime = 150 hrs). It requires the design of a pressure boundary within the cold mass vessel to provide a vacuum tunnel for the proton beam and to minimize the synchrotron radiation gas desorbtion with a suitable material. The Collider beam tube design is under an intensive activity to search for a material that will meet the luminosity requirement without a distributed pump or liner. Second is the tube wall's resistivity requirement (σ*t = 2E5 Ω^{-1}). For a 4.2 K

beam tube the Cu thickness is 100 μm (RRR=30,6.7 T, σ=2E9$\Omega^{-1}m^{-1}$). The copper yield strength is relatively low in comparison to steel and, therefore, the design of the steel layer is governed by the copper layer yield stress limit. A beam tube subjected to eddy current load in a quenching dipole requires an optimum diameter design to provide maximum aperture and adequate cooling space for the liquid Helium flow to cool the beam tube. This paper presents a mechanical design procedure using an established finite element analysis and modeling method to produce a design with safety, matching the dipole cold mass vessel as designed by the ASME code, and to generate a steel tube wall thickness to ensure the copper coating stress below the yield stress limit in a quenching dipole.

24402 (SSCL-Preprint–279) **Conceptual design of the cryostat system for the 2:1 vertical bending dipole magnet of the SSC collider ring.** Jalloh, A.R. (Superconducting Super Collider Lab., Dallas, TX (United States)); Corbett, C.; Chang, C.J.; Baritchi, D.; Chen, S.; Riddle, J.; Gruzdeva, Z.; Daly, E. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–25: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014174. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents the various conceptual designs that were investigated to determine a feasible cryostat system for BV1. The three concepts investigated for this work were: (1) Two separate collider dipole magnets with a rotated upper magnet; (2) Elliptocylindrical vacuum vessel; (3) Cylindrical vacuum vessel. Each of these concepts is discussed in the following sections. It should be pointed out that detailed engineering analyses to study the thermal and structural performance characteristics of the various concepts have not been carried out. These analysis will be done when the design requirements are available. A cylindrical vacuum vessel design was the recommended design for the 2:1 cryostat system.

24403 (SSCL-Preprint–280) **Design and analysis of the cryostat system for a 15 m long prototype quadrupole magnet.** Jalloh, A. (Superconducting Super Collider Lab., Dallas, TX (United States)); Corbett, C.; Chang, C.; Baritchi, D.; Bagwell, S.; Chen, S.; Riddle, J.; Daly, E. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–24: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014133. Source: OSTI; NTIS; INIS; GPO Dep.

Quadrupole magnets with a gradient of 190 T/m are required in several sections of the interaction region of the SSC collider ring. These magnets have an aperture of 50-mm and greater and they are expected to operate at 4.3 K. They vary in length from approximately 6 m to about 15 m. Superconducting magnets with a 50-mm aperture and 15-m length have never been built before. It is necessary to develop and prove out the design and technology for long quadrupole magnets before embarking on the design of tunnel magnets of similar design. A research and development program was initiated in January 1992 in the Magnet SystemsDivision of the SSC Laboratory to develop such a magnet. The goal of this R&D program was to develop a producible and cost effective magnet design and fabrication process that can satisfy performance needs. Thebaseline design is the 50-mm Dipole Cryostat developed at Fermi National Accelerator Laboratory. Attempts were made to improve upon baseline design wherever this was feasible. This paper presents the design that was developed for the cryostat system of the prototype quadrupole magnet.

24404 (SSCL-Preprint–282) **Test performance of the QSE series of 5 cm aperture quadrupole model magnets.** Archer, B.; Bein, D.; Cunningham, G.; DiMarco, J.; Gathright, T.; Jayakumar, J.; Labarge, A.; Li, W.; Lambert, D.; Scott, M.; Snitchler, G.; Zeigler, R. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–23: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014173. Source: OSTI; NTIS; INIS; GPO Dep.

A 5 cm aperture quadrupole design, the QSE series of magnets were the first to be tested in the Short Magnet and Cable Test Laboratory (SMCTL) at the SSCL. Test performance of the first two magnets of the series are presented, including quench performance, quench localization, strain gage readings, and magnetic measurements.Both magnets behaved reasonably well with no quenches below the collider operating current, four training quenches to plateau, and good training memory between thermal cycles. Future magnets in the QSE series will be used to reduce the initial training and to tune out unwanted magnetic harmonics.

24405 (SSCL-Preprint–296) **Simulation of the transverse dipole mode multibunch instability for the SSC Collider.** Chen, S.; Lopez, G. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–80: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014010. Source: OSTI; NTIS; INIS; GPO Dep.

We investigate a simulation code to study the transverse dipole mode multibunch instability due to a single RF cavity and the resistive wall for the Superconducting Super Collider. The growth time calculated from our code agrees well with analytical calculations (ZAP code). The code can be used for studying the interplay of wake field, noise and feedback system, i.e. for design the feedback system.

24406 (SSCL-Preprint–305) **Parameters and conceptual design of a vertical bending magnet for the Super Collider.** Goodzeit, C.; Jayakumar, R.; Nobrega, F.; Snitchler, G.; Stiening, R. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–43: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014077. Source: OSTI; NTIS; INIS; GPO Dep.

Special dipole magnets are required near the intersection regions of the Supercollider to bend the beams in the vertical plane so that they can be made to converge for collision. This paper presents the design requirements and parameters for one of these magnets (the BV1C splitter) along with the magnetic design and conceptual mechanical design for the cold mass.

24407 (SSCL-Preprint–309) **Structural behavior of the six-strut support system.** Dao, B. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–22: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014177. Source: OSTI; NTIS; INIS; GPO Dep.

A simple mathematical model was used to understand the structural behavior of the six-strut support system. By breaking the system into symmetry and antisymmetry configurations, the vertical and torsional displacements were decoupled, thus making simple calculations possible.

24408 (SSCL-Preprint–311) **Using a ceramic chamber in kicker magnets.** Kurennoy, S. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–46: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014068. Source: OSTI; NTIS; INIS; GPO Dep.

A ceramic chamber inside kicker magnets can provide the relevant field risetime. On the other hand, some metallic coating inside has to prevent static charge buildup and shield the beam from ceramic and ferrite at high frequencies to avoid possible resonances. The issues concerning the metallized ceramic chamber, such as coupling impedances and requirements on the coating, are studied to find a compromise solution for kickers of the Medium Energy Booster at the Superconducting Super Collider.

24409 (SSCL-Preprint–318) **Reducing the energy requirements of quench protection heaters for SSC dipoles – Test results.** Haddock, C. (Superconducting Super Collider Lab., Dallas, TX (United States)); Kuzminski, J.; Orris, D.; Mazur, P. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–21: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014135. Source: OSTI; NTIS; INIS; GPO Dep.

Design considerations and first test results of quench protection heaters for Superconducting Collider (SSC) collider dipole magnets have been presented in earlier papers. The heaters have been shown to fully protect the magnet against excessive peak temperature which would represent damage to the superconducting coil. Installation and operation of the heaters does not place the magnet at any increased risk of failure, since the energy densities applied are relatively low ($\sim$1J/cm^2) and the construction technique was made as simple as possible. The energy required by the heaters in order to protect the magnet is considerably larger than that amount estimated during the planning of the collider ring protection scheme. Therefore, three tong magnets following the Accelerator Systems Sizing Test (ASST) construction series at Fermi National Accelerator Laboratory were made available for quench protection heater "R&D" studies. All of the ASST series magnets deliberately kept the high energy requirement heaters for the purpose of commonality for the string test. This paper describes the results of the "R&D" heater tests and the amount of energy reduction achieved. It is shown that it has been possible to reduce the heater energy requirement to a value below therefore potentially save collider cost.

24410 (SSCL-Preprint–320) **Strain gauge pack in process measurement system for the collider quadrupole, design and technology transfer.** Ziegler, R.E. (Superconducting Super Collider Lab., Dallas, TX (United States)); Bein, D.; Brooks, L.; Garza, M.; Rodgers, B.; Novak, G. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–79: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014011. Source: OSTI; NTIS; INIS; GPO Dep.

The in process measurement system that is described below was designed to monitor the strain gauge instrumentation collar pack during all phases of quadrupole magent manufacture. The primary goal was to implement a monitoring system that incorporated standard measurement techniques while maintaining signal integrity. The flexibility and robustness required in a production environment were taken into account throughout the design and implementation. All major components were chosen from commercially available supplies. The driving software was chosen to provide a user friendly interface while keeping software development efforts to a minimum without sacrificing adaptability.

24411 (SSCL-Preprint–326) **Design status report on the collider utility straight insertions.** Parker, B. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–25: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014269. Source: OSTI; NTIS; INIS; GPO Dep.

The lattice for the rings of the Superconducting Super Collider is divided into arcs, a FODO array of superconducting quadrupoles and dipoles; interaction regions, places where the beams are focused and brought into collision within physics detectors; and utility sections, places where injection, acceleration, abort, halo-scraping, and other control and diagnostic functions are performed. Recent modifications to the utility region design are reported here. Briefly these include lowering injection B-maxima by 40%; reducing the lengths and varieties of superconducting quadrupoles; improving conditions for injection matching; increasing abort admittance; mitigating component interferences; and identifying places for dampers and other beam instrumentation.

24412 (SSCL-Preprint–327) **The heat load of an 80 K liner for the SSC.** Maddocks, J.; Yuecel, A. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–15: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014103. Source: OSTI; NTIS; INIS; GPO Dep.

The Superconducting Super Collider (SSC) will be the first proton machine in which synchrotron radiation significantly affects the cryogenic system and the beam tube vacuum. Synchrotron radiation represents the single largest heat load on the 4 K single-phase helium. It also provides a mechanism by which hydrogen can be desorbed from the beam tube wall, gradually worsening the vacuum. Insertion of a perforated and heated liner into the cold beam tube, together with a strip of cryosorber, effectively creates a distributed cryopump. Such an arrangement is an attractive solution to possible vacuum problems, provided it does not increase the heat load on the single-phase helium. In this paper, the primary mechanisms of heat transfer from an 90 K liner are considered, and the results of measurements on heat conduction through prototypical mechanical supports are presented.

24413 (SSCL-Preprint–333) **The Accelerator Systems String Test Program.** Kraushaar, P. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–19: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014260. Source: OSTI; NTIS; INIS; GPO Dep.

The Accelerator Systems String Test (ASST) complex is located at the N15 site in Ellis County Texas. The complex was initially constructed to demonstrate the operation of a standard half-cell of the Collider machine lattice using prototypical superconducting magnets. The ASST half cell consisted of five 50 mm aperture dipoles, one 40-mm aperture quadrupole and three spool pieces. This demonstration was a Congressionally-mandated milestone for the Superconducting Super Collider Laboratory (SSCL) and was scheduled for completion by October 1, 1992. The milestone test (Run 1) was completed with the successful powering ofthe half cell to 6500 A in mid-August 1992.

24414 (SSCL-Preprint–342) **Quench and quench protection for the SSC collider correctors.** He, A. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–10: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014070. Source: OSTI; NTIS; INIS; GPO Dep.

The quench voltage, especially the turn-to-turn voltage, and the maximal temperature rise due to the quench in 50-mm-aperture Superconducting Super Collider correctors are calculated for various currents. The calculation shows a lower copper-to-superconductor ratio gives a lower quench voltage and a lower temperature rise as the result of much higher heat capacity of the superconducting material and lower copperresistivity at lower temperature. It also shows that when the copper to superconductor ratio is 2.2 to 1, each individually powered magnet is self-protected, and for the series of 24 correctors that are poweredtogether in the collider, a parallel 2-O resistor on each magnet will provide needed protection. The energy loss on these resistors during powering up is less than 5% of the energy stored in the magnet at the operating current.

24415 (SSCL-Preprint–349) **Modification of the short straight sections of the high energy booster of the SSC.** Li, M.; Johnson, D.; Kocur, P.; Schailey, R.; Servranckx; Talman, R.; Yan, Y.; York, R.; Yarba, V. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–55: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014139. Source: OSTI; NTIS; INIS; GPO Dep.

The tracking analysis with the High Energy Booster (HEB) of the Superconducting Super Collider (SSC) indicated that the machine dynamic aperture for the current lattice (Rev 0 lattice) was limited by the quadrupoles in the short straight sections. A new lattice, Rev 1, with modified short straight sections was proposed. The results of tracking the two lattices up to 5 $\times$ 10^5 turns (20 seconds at the injection energy) with various random seeds are presented in this paper. The new lattice has increased dynamic aperture from

~7 mm to ~8 mm, increases the abort kicker effectiveness, and eliminates one family (length) of main quadrupoles. The code DIMAD was used for matching the new short straight sections to the ring. The code TEAPOT was used for the short term tracking and to create a machine file, zfile, which could in turn be used to generate a one-turn map with the ZLIB for fast long-term tracking using a symplectic one-turn map tracking program ZIMAPTRK.

24416 (SSCL-Preprint–356) **Broadband higher-order mode (HOM) damper for SSC LEB ferrite-tuned cavity.** Walling, L.; Hulsey, G.; Grimm, T. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–21: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014273. Source: OSTI; NTIS; INIS; GPO Dep.

This paper reports results of using High-Frequency Structure Simulator (HFSS) to design a Smythe-type broadband longitudinal HOM damper for the SSCL low energy booster (LEB) ferrite-tuned cavity. The damper is designed to have a shunt impedance varying from less than 1 kohm between 100–200 MHz to about 3 kohm at 1 GHz. Above 1 GHz, the ferrite should effectively damp all HOM.

24417 (SSCL-Preprint–358) **Consequences of kicker failure during HEB to collider injection and possible mitigation.** Soundranayagam, R.; Drozhdin, A.I.; Mokhov, N.V.; Parker, B.; Schailey, R.; Wang, F. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–109: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014066. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper we discuss the three failure modes, namely, single kicker failure, two kickers failure and timing error between the extraction and injection kickers. We propose possible means of protecting the accelerator components.

24418 (SSCL-Preprint–361) **RF system analyses for the SSC collider rings.** Rogers, J.; Coleman, P.; Schaffer, G.; Wallace, J.; Wang, X.; Zhao, Y. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–64: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014082. Source: OSTI; NTIS; INIS; GPO Dep.

The Collider RF system is required to accelerate and store a 70 mA DC proton beam from 2 TeV to 20 TeV. Various approaches have been studied as possible ways to accomplish this task. These include systemsbased on five-cell normal conducting cavities, single-cell normal conducting cavities, and single-cell superconducting cavities. This paper outlines the physics requirements that the system must meet and presents comparisons of the expected performance of various systems. Transient beam loading, injection error, power requirements, coupled bunch mode instabilities, etc. are considered.

24419 (SSCL-Preprint–363) **An experimental and analytical study of a buoyancy driven cooling system for a particle accelerator.** Campbell, B.; Ranganathan, R. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–23: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014274. Source: OSTI; NTIS; INIS; GPO Dep.

A buoyancy driven closed-loop cooling system that transports the heat generated in a particle accelerator to the ambient has been evaluated both through experiments performed earlier and analysis techniques developed elsewhere. Excellent comparisons between measurements and calculations have been obtained. The model illustrates the feasibility (from a heat transfer viewpoint) of such a cooling system for a particle accelerator.

24420 (SSCL-Preprint–366) **Effect of betatron motion on the spetum flux in superslow extraction at the SSC.** Newberger, B. (Texas Univ., Austin, TX (United States)); Ellison, J.; Shih, H. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States); Texas National Research Lab. Commission, De Soto, TX (United States). DOE Contract AC35-89ER40486. Grant RGFY 9234. (CONF-930511–20: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014257. Source: OSTI; NTIS; INIS; GPO Dep.

A scheme for the superslow extraction of protons from SSC rings for high energy test beam or precision fixed-target B physics is currently being investigated. The flux onto the extraction septum (a curved Si crystal) is to be general diffusion produced by noise injected into the RF system. The extraction rate depends on both the diffusion of the closed orbit (due to dispersion at the crystal) and the horizontal betatron amplitude of the diffusing protons. The diffusion of the closed orbit has previously been described by the one-dimension longitudinal diffusion theory of Dome and Krinsky and Wang. In this paper, we extend this theory to include effect of the betatron motion. Comparisons with Monte Carlo tracking simulations are made.

24421 (SSCL-Preprint–371) **Physics requirements of commissioning diagnostics for SSCL linac.** Hurd, J.W. (Superconducting Super Collider Lab., Dallas, TX (United States)); Arbique, G.M.; Crist, C.E.; Guy, F.W.; Haworth, M.; Leifeste, G.T.; Saadatmand, K.; Krogh, M.; Mcginnis, K.; Stittsworth, D.; Vandeusen, A.; Wright, S. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–5: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014105. Source: OSTI; NTIS; INIS; GPO Dep.

Commissioning diagnostics are described in terms of the beam physics requirements of the SSCL linac. Commissioning diagnostics include current monitors, beam position monitors, spectrometer, foil scattering experiment, wire scanners, Faraday cups, and bunch shape monitors. Two DOE integrated contractors, the Superconducting Super Collider Laboratory and Allied Signal, Kansas City Plant, are developing the commissioning diagnostics. The need to measure bright, short linac beam pulses requires special design considerations. High density harps and collectors with up to 50 wires per cm and 128 wires total, and fast, 3.5-MHz amplifiers have been developed. The diagnostics will be first used and tested during beam commissioning of the RFQ.

24422 (SSCL-Preprint–373) **Beam diagnostic layout requirements for SSCL linac.** Hurd, J.; Guy, F.; Jamieson, G.; Raparia, D.; Saadatmand, K. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–12: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014072. Source: OSTI; NTIS; INIS; GPO Dep.

A basic set of diagnostics is needed to commission, tune, and monitor the operation of the SSCL linac. This set of diagnostics has been relined in the final stages of design of the linac. Planned diagnostics include current monitors, Faraday cups, beam loss monitors, beam position monitors, wire scanners, absorber-collector phase scan units, slit and collector emittance measurement units, and longitudinal bunch shape monitors. The diagnostics are described and their placement along the linac is given. The use of the diagnostics for tuning the linac is described. The first set of diagnostics will be installed with the RFQ, with additional diagnostics installed with each linac section.

24423 (SSCL-Preprint–376) **Effective stress of the SSC 80-K synchrotron radiation liner in a quenching dipole magnet.** Leung, K.K.; Shu, Q.S.; Yu, K.; Zbasnik, J. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–11: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014071. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the effective stress on a proposed SSC beam tube. The new issue for the Collider compared to earlier accelerators is the combination of synchrotron radiation with the 4.2-K bore tube of the superconducting magnets. One design option is to use a liner within a bore tube to remove the radiated

power and the accompanying photodesorbed gas that impair the beam tube vacuum. Design of the SSC 80-K synchrotron radiation liner requires vacuum luminosity lifetime = 150 hours and liner electrical conductivity, σ*t > 2E5 Ω-1. The bimetallic liner tube is subjected to cool down and eddy current loads. The liner tube is a two-shell laminate with Nitronic-40 steel for strength and a copper inner layer for low impedance to the image currents induced by the circulating protons. High electrical conductivity of the copper layer is essential for minimizing the power losses. Perforated holes are used to remove the photodesorbed gases for vacuum maintenance. The tube is cooled by 80-K lines. Structural design of the liner is not covered by the ASME code. The life of the liner involves structural integrity and keeping the copper laminate within yield stress limits to maintain the high surface finish for minimizing the power losses. The copper layer stress governs the structural design of the liner. The liner tube analysis is a three-dimensional non-linear stress problem. Thermal transient cool down stress is not considered in this analysis because of the floating support design of the liner. This analysis will address the axial thermal stress, non-axisymmetrical eddy current loads, dynamic and non-linear material effect on the liner that have not been considered in publications on beam tube structural analyses.

24424 (SSCL-Preprint–378) **Photodesorption experiments on SSC collider beam tube configurations.** Maslennikov, I. (Superconducting Super Collider Lab., Dallas, TX (United States)); Turner, W.; Anashin, V.; Malyshev, O.; Osipov, V.; Nazmov, V.; Pindyurin, V.; Salimov, A.; Foerster, C.; Lanni, C. Superconducting Super Collider Lab., Dallas, TX (United States); AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. May 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–29: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014107. Source: OSTI; NTIS; INIS; GPO Dep.

Experimental measurements of photodesorption coefficients of H_2, CH_4, CO and CO_2 are being done to obtain data necessary to predict the vacuum performance of the Collider. Experiments have been done or are planned for warm tubes (i.e. room temperature), cold tubes (i.e. 4.2 K) and liner configurations (i.e. 4.2 K, 20 K and 80 K). Two synchrotron radiation beamlines have been constructed on the VEPP-2M storage ring at BINP, Russia. The photon critical energy is 284 eV, as in the SSC Collider, angle of incidence is 10 mrad. To date approximately fifteen warm beam tubes have been tested, including elecrodeposited Cu, high purity bulk Cu and Nitronic 40 SS, several cleaning procedures, with and without in-situ baking and with and without magnetic field. The maximum integrated photon dose was achieved was $2{\cdot}10^{22}$ photons/m on the high intensity beamline. Several experiments have been done on the VUV ring at BNL to check a subset of the BINP data and to extend the integrated photon flux up to 10^{23} photons/m, or 100 days of SSC operation. The data from the warm experiments will be used to evaluate the best tubes to be used in the more time consuming cold experiments.

24425 (UCRL-JC–111229) **Improved focus solenoid design for linear induction accelerators.** Zentler, J.M. (Lawrence Livermore National Lab., CA (United States)); Van Maren, R.D.; Nexsen, W.E. Lawrence Livermore National Lab., CA (United States). Aug 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9208109–79: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE93011895. Source: OSTI; NTIS; INIS; GPO Dep.

Our FXR linear induction accelerator produces a 2 KA, 17 MeV electron beam of 60 ns duration. The beam is focused on a tantalum target to produce x-rays for radiography. The FWHM spot size of the focused beam is currently 2.2 mm. We strive to reduce the spot size by 30% by improving the field characteristics of focusing solenoids housed in each of 50 induction cells along the beamline. Tilts in the magnetic axis of the existing solenoids range up to 12 mrad (0.7 degrees). We are building new solenoid assemblies which include ferromagnetic homogenizer rings. These dramatically reduce field errors. A field tilt of under 0.5 mrad has been achieved. Mechanical alignment of the rings is critical. We developed a novel construction method in which the rings are wound with 4 mil thick Si-Fe ribbon into grooves on an aluminum cylinder. The cylinder then becomes the winding mandrel for the focus solenoids. This forms a more accurate and compact assembly than the standard practice of pressing individual solid rings onto a tube.

24426 (UCRL-JC–112275) **Critical issues for vacuum systems in B factories.** Barletta, W.A. (Lawrence Livermore National Lab., CA (United States)). Lawrence Livermore National Lab., CA (United States). Nov 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9204126–20: B factories: state of the art in accelerators, detectors, and physics, Stanford, CA (United States), 6-10 Apr 1992). Order Number DE93013831. Source: OSTI; NTIS; GPO Dep.

B factories with sufficient luminosity for the study of CP violation will require beams with characteristics more demanding on technical sub-systems than those of previous $e^+ - e^{minus}$ colliders. In particular, the consequent system requirements on the vacuum chamber and pumping systems will require a vigorous R&D program to resolve critical technical issues and to validate design approaches.

24427 (UCRL-JC–112342) **Analysis of beam loading in electrostatic columns.** Caporaso, G.J.; Barnard, J.J. Lawrence Livermore National Lab., CA (United States). 12 May 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930511–68: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93013851. Source: OSTI; NTIS; INIS; GPO Dep.

A lumped element circuit model is derived which accounts for both electric and magnetic coupling of the beam to the electrodes and drive circuitry of an electrostatic column. A modified one dimensional Poisson equation which incorporates two dimensional effects is discussed. An effective capacitance between the beam and the column electrodes which affects the electric coupling is estimated. Simple analytic cases which treat electric and magnetic coupling separately are solved and compared against a numerical simulation. Scaling laws are given for the magnitude of the beam loading.

4304 Storage Rings

24428 (BNL–48792) **Impedance of the NSLS prototype small-gap undulator vacuum chamber.** Bane, K. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)); Krinsky, S. Brookhaven National Lab., Upton, NY (United States). Mar 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93012530. Source: OSTI; NTIS; GPO Dep.

Insertion device performance is limited by the minimum magnet gap allowed by storage ring beam dynamics. In this note, we analyze the impedance of the vacuum chamber for the prototype small-gap undulator being built for the NSLS X-Ray ring, and discuss the consequent beam instability thresholds.

24429 (INIS-RU–343, pp. 10-15) **Physical design of electron cooling of the AN Ukrainian SSR IYal accelerating-storage complex.** Val'kov, A.E. (AN Ukrainskoj SSR, Kiev (Ukraine). Inst. Yadernykh Issledovanij); Dolinskij, A.V.; Zhmendak, A.V.; Pavlov, S.N.; Papash, A.I.; Dikanskij, N.S.; Kudelajnen, V.I.; Pestrikov, D.V.; Sukhina, B.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i; AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1991. [80p.] (In Russian). In *Nuclear-physical researches (Theory and experiment): Scientific-technical collection.* Order Number DE93626131. Source: OSTI; NTIS (US Sales Only); INIS.

General performance data of the accelerating-storage complex (ASC) with electron cooling are presented and physical aspects of its construction are considered; the ring is being built in the Institute of Nuclear Research of the Ukrainian Academy of Sciences. It is shown that an electron cooling system with charge compensated

electron beam should be used for expanding experimental capability of the designed ASC. 13 refs.; 5 tabs.

24430 (LA-UR–93-1866) **Status of the PSR improvement program.** Macek, R.J.; Fitzgerald, D.H.; Hoehn, M.V.; Ryder, R.D.; York, R.L. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930511–41: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93014479. Source: OSTI; NTIS; INIS; GPO Dep.

A program of improvements to increase intensity and improve reliability of the Los Alamos Proton Storage Ring (PSR) has been under way for several years. Reduction of stored beam loss rates by a factor of 4.6 since 1987 through exploitation of H^0 injection has allowed the average intensity to increase by a factor of two to 75μA. Reliability of the PSR and associated beam delivery systems has been improved by extensive rework of numerous subsystems. Radiation protection has been improved by additional shielding of Line D and extensive use of relatively fail-safe radiation detectors incorporated into an improved radiation security system.

44 INSTRUMENTATION

24431 (DOE/CE/40777–10) **On-machine sensors to measure paper mechanical properties.** Hall, M.S.; Brodeur, B.H.; Jackson, T.G. Institute of Paper Science and Technology, Atlanta, GA (United States). [1991]. 75p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-86CE40777. (CONF-9111305–1: Department of Energy industry advanced sensors technical conference, Cincinnati, OH (United States), 11 Nov 1991). Order Number DE93010636. Source: OSTI; NTIS; GPO Dep.

The purpose of the program is to develop sensors capable of measuring the velocity of ultrasound in the thickness and in-plane directions of paper while the paper is moving at line speed on the paper machine. These measurements would provide a nondestructive characterization of the mechanical properties of paper, allowing continuous monitoring of product quality as well as providing data for controlling the papermaking process.

Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9110232–: Symposium on Relativistic Heavy Ion Collider (RHIC) detector R&D, Upton, NY (United States), 10-11 Oct 1991). Order Number DE93010855. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains papers on the following topics: Development of Analog Memories for RHIC Detector Front-end Electronic Systems; Monolithic Circuit Development for RHIC at Oak Ridge National Laboratory; Highly Integrated Electronics for the STAR TPC; Monolithic Readout Circuits for RHIC; New Methods for Trigger Electronics Development; Neurocomputing methods for Pattern Recognition in Nuclear Physics; The Development of a Silicon Multiplicity Detector System; A Transition Radiation Detector for RHIC Featuring Accurate.

24433 (CIEMAT–699) **Thin, conductive, pyrrolyc film production for radioactive sources backings.** Rodriguez, L.; Los Arcos, J.M. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). 1993. 29p. (In Spanish). Order Number DE93796617. Source: OSTI; NTIS.

A procedure for electropolymerization of pyrrole has been set up in order to produce thin (> 15 μ g/cm^2) homogeneous (thickness variation <2%) films, with no need for additional metallization to be used as backings of radioactive sources, having 10-0,4 kω/sample, for 35-70 μg/cm^2. The experimental equipment, reagent and procedure utilized is described as well as the characterization pyrrolic films produced.

24434 (CONF-920791–, pp. 3, Paper 29) **Improvements in inductively coupled plasma - mass spectrometry for elemental and isotopic analysis.** Houk, R.S. (Iowa State Univ., Ames (US)); Warren, A.R.; Pang, Homing. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

A new type of ICP-MS device that contains two separate quadrupole mass analyzers. The objective is to improve the precision and sensitivity with which either stable or radioactive elements may be determined in any type of sample. Representative applications pertinent to waste remediation will be pursued.

24435 (CONF-920837–45) **Preliminary results from the CMD-2 detector.** Khazin, B.I.; Akhmetshin, R.R.; Aksenov, G.A.; Anashkin, E.V.; Aulchenko, V.M.; Baibusinov, B.O.; Banzarov, V.S.; Barkov, L.M.; Baru, S.E.; Bashtovoi, N.S.; Bondar, A.E.; Eidelman, S.I.; Fedorenko, V.E.; Fedotovitch, G.V.; Grebeniuk, A.A.; Grigoriev, D.N.;Pittsburgh Univ., PA (United States). Dept. of Physics and Astronomy. [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40646. From ICHEP-26: 26th International Union of Pure and Applied Physics (IUPAP) conference on high energy physics; Dallas, TX (United States); 6-12 Aug 1992. Order Number DE93013491. Source: OSTI; NTIS; INIS; GPO Dep.

A new general-purpose detector CMD-2 (calorimetric magnetic detector has started experiments at the upgraded e^+e^- collider VEPP-2M (collider for electron-positron beams) at Novosibirsk. During early runs an integrated luminosity of about 400 inverse nanobarns has been collected in the center of mass energy range 400–1030 MeV.

24436 (DOE/ER/40660–1) **GEM muon tracking R and D: Progress report, August 1992–July 1993.** Lau, K.; Mayes, B.; Pyrlik, J.; Weinstein, R. Houston Univ., TX (United States). Inst. for Beam Particle Dynamics. Apr 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-91ER40660. Order Number DE93014097. Source: OSTI; NTIS; INIS; GPO Dep.

The suitability of open-profile CSCs for the GEM muon system was evaluated by constructing a small (0.5 m x 1.0 m) prototype and testing it with cosmic ray muons. The measured spatial resolution surpassed the GEM requirement of 75 μm. The test results were compared with Monte Carlo simulations; good agreement was found. Studies of the timing properties of the prototype have been started.

24437 (FNAL/C–93/043-E) **A scintillating fiber detector for the D0 upgrade.** Wayne, M. (Notre Dame Univ., IN (United States). Dept. of Physics). D0 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States); Notre Dame Univ., IN (United States). Dept. of Physics. Mar 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-921122–49: Meeting of the Division of Particles and Fields of the American Physical Society, Batavia, IL (United States), 10-14 Nov 1992). Order Number DE93011658. Source: OSTI; NTIS; INIS; GPO Dep.

In the Step 1 version of the D0 upgrade, the inner vertex chamber will be replaced by a system of silicon microstrips surrounded by a scintillating fiber detector. Details of the detector design and status of R&D and construction programs for the detector are presented. Progress on the upcoming large-scale cosmic ray test at Fermilab is also reported.

24438 (FNAL/C–93/053-E) **Upgraded Dν calorimeter electronics for short Tevatron bunch space and the effect of pile-up on the W mass measurement.** Lokos, S. For the DO Collaboration. Fermi National Accelerator Lab., Batavia, IL (United

States). Nov 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-921122–56: Meeting of the Division of Particles and Fields of the American Physical Society, Batavia, IL (United States), 10-14 Nov 1992). Order Number DE93013566. Source: OSTI; NTIS; INIS; GPO Dep.

The high luminosity and short bunch spacing time of the upgraded Tevatron force the calorimeter to replace a significant part of the present electronics. The W mass measurement was used to study the pile-up effects.

24439 (IFVE-OEF–90-88) **Manufacture of mirrors with high reflectivity in the VUV-region.** Buzulutskov, A.F.; Vanyushkin, Yu.V.; Kostrikov, M.E.; Chernetsov, M.I. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1990. [7p.] (In Russian). Order Number DE93626355. Source: OSTI; NTIS (US Sales Only); INIS.

The technique for manufacturing mirrors with high reflectivity in the VUV-region is described. The mirrors are designed to be used in the RICH-detector. 6 refs.; 6 figs.

24440 (INDC(NDS)–213/GM3, pp. 67) **Semiconductor detectors for the calibration of the targets from fissile radionuclides.** Loshaev, S.L. (Radievyj Inst., Leningrad (Russian Federation)); Soloviev, S.M. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Oct 1988. (CONF-8809159–: 14. world conference of the International Nuclear Target Development Society (INTDS): heavy-ion targets and related phenomena, Darmstadt (Germany), 5-9 Sep 1988). In *The influence of target and sample properties on nuclear data measurements: Summary report of the IAEA advisory group meeting in co-operation with the International Nuclear Target Development Society (INTDS), held in Darmstadt, Germany, 5-9 September 1988.* [74p.] Order Number DE93626092. Source: OSTI; NTIS (US Sales Only); INIS.

The description of the set of semiconductor detectors with a large area and complicated shapes used in the Radium Institute for the calibration of alpha activities of targets from fissile radionuclides including low radioactive targets and targets with complex configurations will be presented. (author). Abstract only.

24441 (JINR–5-51-91, pp. 23-37) **Scintillation forward spectrometer of the SPHERE setup.** Anisimov, Yu.S.; Afanas'ev, S.V.; Bondarev, V.K. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1991. [64p.] (In Russian). In *JINR rapid communications: Collection.* Order Number DE93626358. Source: OSTI; NTIS (US Sales Only); INIS.

The construction of the forward spectrometer for the 4π SPHERE setup to study multiple production of particles in nucleus-nucleus interactions is described. The measured parameters of the spectrometer detectors are presented. 7 refs.; 14 figs.; 1 tab.

24442 (JINR-E–1-92-101) **The compensation of longitudinal energy leakage in the short absorption calorimeters.** Gavrishchuk, O.P. (and others); Eremeev, R.V.; Kadykov, M.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1992. [6p.] Order Number DE93626356. Source: OSTI; NTIS (US Sales Only); INIS.

The influence of longitudinal nuclear cascade fluctuations and (transparence)on hadron sampling-calorimeter energy resolution was under consideration on this paper. The possibility to improve the energy resolution with the compensation of shower leakage in longitudinal direction was achieved by optimization of the shifter attenuation length in the light pipe. 6 refs.; 3 figs.

24443 (JINR-R–13-92-91) **Streamer chamber of the GIBS spectrometer.** Aksinenko, V.D. (and others); Vardenga, G.L.; Glagoleva, N.S. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1992. [10p.] (In Russian). Order Number DE93626357. Source: OSTI; NTIS (US Sales Only); INIS.

The streamer chamber of the GIBS magnetic spectrometer constructed on the 2m streamer chamber SKM-200 basis is described. The streamer chamber is used in the beams of accelerated nuclei at the JINR synchrophasotron. 9 refs.; 7 figs.

24444 (JINR-R–15-92-50) **Main characteristics of scintillation phoswich-detectors for the 4π-experimental setup PHOBOS.** Fomichev, A.S. (and others); Ortlepp, H.G.; Penionzhkevich, Yu.Eh. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Reactions. 1992. [10p.] (In Russian). Order Number DE93626386. Source: OSTI; NTIS (US Sales Only); INIS.

The main characteristics of a scintillation part for the 4π-multidetector PHOBOS are described. The choice of the scintillator material and type of photomultiplier are discussed and the description of the mechanical and electronic design is given. 12 refs.; 8 figs.

24445 (LA–12413) **Superlattice electroabsorption radiation detector.** Cooke, B.J. Los Alamos National Lab., NM (United States). Jun 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93014019. Source: OSTI; NTIS; INIS; GPO Dep.

This paper provides a preliminary investigation of a new class of superlattice electroabsorption radiation detectors that employ direct optical modulation for high-speed, two-dimensional (2-D), high-resolution imaging. Applications for the detector include nuclear radiation measurements, tactical guidance and detection (laser radar), inertial fusion plasma studies, and satellite-based sensors. Initial calculations discussed in this paper indicate that a 1.5-μm (GaAlAs) multi-quantum-well (MQW) Fabry-Perot detector can respond directly to radiation of energies 1 eV to 10 KeV, and indirectly (with scattering targets) up through gamma, with 2-D sample rates on the order of 20 ps.

24446 (LA-SUB–93-100) **HELGA HPGe detectors: Final report.** Reintiz, K. (EG and G Washington Analytical Services Center, Inc., Suitland, MD (United States)). Los Alamos National Lab., NM (United States); EG and G Washington Analytical Services Center, Inc., Suitland, MD (United States). 31 May 1987. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93009411. Source: OSTI; NTIS; GPO Dep.

An improvement in the present HELGA project, could be obtained, if the remaining units purchased could be N-type detectors, since the dead layer on these units is negligible. Some improvement in sensitivity could be obtained with the N-type units, because of the virtual elimination of the dead layer, but it would require an additional power, supply and some addition to and modification of the existing electronics. During the course of the contract an experiment, was suggested to verify the analysis and to introduce the application variables one by one. In this manner, these variables could be better, understood and controlled. The experiment would use an N-type slab-like detector and the beam would be collimated toward its central portion. In this manner, the effect of the dead layer, detector, geometry and non-uniform electric field would be eliminated. Penetrating gamma rays should be used so that their, range is a substantial (about 3/4) fraction of the detector thickness arid the count rate should be low to minimize dead time corrections. This experiment would eliminate many of the corrections that need to be introduced into the calculations to bring the experiment into a seasonable agreement.

24447 (LA-UR–93-1162) **Silicon-based elementary particle tracking system: Materials science and mechanical engineering design.** Miller, W.O.; Gamble, M.T.; Thompson, T.C.; Hanlon, J.A. Los Alamos National Lab., NM (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930758–1: 9. international conference on composite materials, Madrid (Spain), 12-16 Jul 1993). Order Number DE93012630. Source: OSTI; NTIS; GPO Dep.

Research and development of the mechanical, cooling, and structural design aspects of a silicon detector-based elementary particle tracking system has been performed. Achieving stringent system precision, stability, and mass requirements necessitated the use of graphite fiber-reinforced cyanate-ester (C-E) resins. Mechanical test results of the effects of butane, ionizing radiation, and a combination of both on the mechanical properties of these materials are presented, as well as progress on developing compression molding of an ultralightweight graphite composite ring structure and TV holography-based noninvasive evaluation.

24448 (LA-UR–93-1389) **A new chopper spectrometer for neutron Brillouin scattering and low-angle neutron inelastic scattering: PHAROS (Phase 1).** Robinson, R.A.; Nutter, M.; Ricketts, R.L.; Larson, E.; Sandoval, J.P.; Lysaght, P.; Olivier, B.J. Los Alamos National Lab., NM (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9305177–1: 12. International collaboration of advanced neutron sources meeting (ICANS), Abingdon (United Kingdom), 24-28 May 1993). Order Number DE93012678. Source: OSTI; NTIS; INIS; GPO Dep.

Phase I of PHAROS, the new chopper spectrometer at LANSCE, is described in detail. The main components are a water moderator, a 60-Hz double-bladed T-zero chopper, a 600Hz magnetic-bearing Fermi chopper, a 6m-long vacuum vessel with thin aluminium-alloy vacuum window and a 1.2m^2 array of linear position-sensitive detectors.

24449 (LBL–33295) **Experimental efforts and results in finding new heavy scintillators.** Derenzo, S.E.; Moses, W.W. Lawrence Berkeley Lab., CA (United States). Sep 1992. 11p. Sponsored by USDOE, Washington, DC (United States); Department of Health and Human Services, Washington, DC (United States). DOE Contract AC03-76SF00098. Grant R01-CA48002. (CONF-9209253–4: Crystal 2000 international workshop on heavy scintillators for scientific and industrial applications, Chamonix (France), 22-26 Sep 1992). Order Number DE93010406. Source: OSTI; NTIS; GPO Dep.

New heavy scintillators are being discovered with increasing frequency. In recent years NaI(Tl) (with its high light output and energy resolution) has been joined by BGO (with its high stopping power), BaF_2 (with its excellent timing resolution), and CeF_3 (with its speed and short Moliere radius). More than 10 potentially useful scintillators have been under development in the past five years, such as $PbSO_4$ and Lu_2SiO_5(Ce). We tabulate the characteristics of these and other scintillators, including wavelength, luminous efficiency, decay time, and initial intensity. We describe a search strategy and the prospects for finding the "ideal" heavy scintillator, which would combine the light output of NaI(Tl) and CsI(Tl), the stopping power of BGO, and the speed of BaF_2 and ZnO(Ga).

24450 (ORNL/FTR–4183) **[Travel to Switzerland to attend a meeting of the WA93 Collaboration]: Foreign trip report, January 5–12, 1992.** Young, G.R. Oak Ridge National Lab., TN (United States). 24 Jan 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011089. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended the WA93 collaboration meeting held at CERN, Geneva, Switzerland, on January 6–11, 1992. Other local attendees included Terry Awes (ORNL) and Xiaochun He (University of Tennessee). Representatives from GSI, Lund, Munster, Utrecht, KVI, Kurchatov, and Geneva were also in attendance. The spokesman, Hans Gutbrod, was ill. The meeting was, thus, run in Gutbrod's absence by Michel Martin, head of the University of Geneva group, and by Rainer Santo, head of the University of Munster group. Copies of transparencies shown plus minutes taken are available.

24451 (ORNL/FTR–4277) **[Travel to Switzerland and France to discuss current scintillation crystal technology]: Foreign trip report, May 5–9, 1992.** Heck, J.L. Jr.; Rennich, M.J. Oak Ridge National Lab., TN (United States). 9 Jun 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011073. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Technical discussions were held about the experience gained by CERN in procuring bismuth germanate (BGO) scintillation crystals from the Shanghai Institute of Ceramics (SIC) in China. These discussions primarily focused on the processes, facilities and equipment used to grow and mechanically process scintillation crystals. Discussions were not limited to BGO, but also included the future possibility of SIC producing cerium fluoride crystals for CERN as well as barium fluoride crystals for the GEM detector to be used at the SSC.

24452 (PTB-Dos–21) **Dose measurement techniques for high-energy photon and electron radiation. Proceedings.** Hohlfeld, K.; Roos, M. (eds.). Physikalisch-Technische Bundesanstalt, Braunschweig (Germany). Dosimetrie. Aug 1992. 127p. (In German). (CONF-9111318–: 95. PTB seminar 'Dose measurement techniques for high-energy photon and electron radiation', Braunschweig (Germany), 11-12 Nov 1991). Order Number DE93796871. Source: OSTI; NTIS (US Sales Only); INIS.

By law the Federal Institute of Physics and Technology (PTB) has been assigned the tasks of representing, preserving and passing on dose units. The analogous continuation of these tasks consists in improving, at the user level, dosimetry techniques in radiation therapy for the benefit of patients. The PTB had an essential share in working out the scientific foundations of dosimetry for high-energy radiation, and the corresponding DIN standards were established with the PTB playing a promiment part. The seminar aimed at presenting the measuring techniques fixed in the new DIN standard 6800 part 2 'Dose measurement techniques according to the probe method - ionization dosimetry', to discuss their physical background and practical implications resulting from them. (orig.).

24453 (PTB-Dos–21, pp. 1-12) **Representation and preservation of the water-energy dose unit.** Roos, M. (Physikalisch-Technische Bundesanstalt, Braunschweig (Germany)). Physikalisch-Technische Bundesanstalt, Braunschweig (Germany). Dosimetrie. Aug 1992. (In German). (CONF-9111318–: 95. PTB seminar 'Dose measurement techniques for high-energy photon and electron radiation', Braunschweig (Germany), 11-12 Nov 1991). In *Dose measurement techniques for high-energy photon and electron radiation. Proceedings.* 127p. Order Number DE93796871. Source: OSTI; NTIS (US Sales Only); INIS.

To represent the water-energy dose unit for high-energy photon and electron radiation, the chemical procedure was expanded into a fundamental measuring technique, and established as a primary normal measuring device of the Federal Republic of Germany. In addition, the water-energy calorimetric dosemeter, a definition measuring method, is being developed which seems to be destined for making a contribution, over the longer term, to reducing measuring uncertainties in dosimetry. (orig./DG).

24454 (PTB-Dos–21, pp. 13-23) **Passing on of the water-energy dose unit - the concept of the standard DIN 6800 part 2.** Hohlfeld, K. Physikalisch-Technische Bundesanstalt, Braunschweig (Germany). Dosimetrie. Aug 1992. (In German). (CONF-9111318–: 95. PTB seminar 'Dose measurement techniques for high-energy photon and electron radiation', Braunschweig (Germany), 11-12 Nov 1991). In *Dose measurement techniques for high-energy photon and electron radiation. Proceedings.* 127p. Order Number DE93796871. Source: OSTI; NTIS (US Sales Only); INIS.

In order to be able to perform a reliable measurement with a maximum of accuracy by means of an available measuring instrument, a prescribed measuring technique has to be used. The measuring technique for ionization chamber dosimetry is fixed in the standard DIN 6800 part 2 (1990). The steps necessary for representation and preservation of the unit are described in detail, above all with regard to the effects they have on the measuring accuracy of dose determination. (orig./DG).

24455 (PTB-Dos–21, pp. 24-45) **The radiation field in the water phantom.** Grosswendt, B. (Physikalisch-Technische Bundesanstalt, Braunschweig (Germany)); Roos, M. Physikalisch-Technische Bundesanstalt, Braunschweig (Germany). Dosimetrie. Aug 1992. (In German). (CONF-9111318–: 95. PTB seminar 'Dose measurement techniques for high-energy photon and electron radiation', Braunschweig (Germany), 11-12 Nov 1991). In *Dose measurement techniques for high-energy photon and electron radiation. Proceedings.* 127p. Order Number DE93796871. Source: OSTI; NTIS (US Sales Only); INIS.

After analysing the possibilities of simulating radiation transport of electrons and photons in matter, several basic principles of Monte Carlo transport calculations are introduced and applied to the dosimetry of radiation fields in water phantoms. Priority is given to the determination of stopping power ratios and energy parameters to characterize clinical radiation fields since they are of fundamental importance for dosimetry in radiation therapy. (orig.).

24456 (PTB-Dos–21, pp. 46-60) **General corrections in ionization dosimetry.** Derikum, K. (Physikalisch-Technische Bundesanstalt, Braunschweig (Germany)). Physikalisch-Technische Bundesanstalt, Braunschweig (Germany). Dosimetrie. Aug 1992. (In German). (CONF-9111318–: 95. PTB seminar 'Dose measurement techniques for high-energy photon and electron radiation', Braunschweig (Germany), 11-12 Nov 1991). In *Dose measurement techniques for high-energy photon and electron radiation. Proceedings.* 127p. Order Number DE93796871. Source: OSTI; NTIS (US Sales Only); INIS.

Factor k corrects the effect of influence quantities which in dose measurement deviate from reference conditions during calibration. Such correction factors apply both to electron and photon radiation. The following paragraphs explain the respective physical effects on which they are based. It is stated how corrections have to be determined and which value ranges are to be expected. For ionization chambers which were studied at the linear accelerator of the PTB, experimentally determined correction factors are indicated for typical measuring conditions. (orig./DG).

24457 (PTB-Dos–21, pp. 61-66) **The correction factor k_Q for radiation quality of high-energy photon radiation.** Krauss, A. (Physikalisch-Technische Bundesanstalt, Braunschweig (Germany)). Physikalisch-Technische Bundesanstalt, Braunschweig (Germany). Dosimetrie. Aug 1992. (In German). (CONF-9111318–: 95. PTB seminar 'Dose measurement techniques for high-energy photon and electron radiation', Braunschweig (Germany), 11-12 Nov 1991). In *Dose measurement techniques for high-energy photon and electron radiation. Proceedings.* 127p. Order Number DE93796871. Source: OSTI; NTIS (US Sales Only); INIS.

The correction factor k_Q for indicating the water-energy dose, takes into consideration the change in the response of the ionization chamber as a function of the radiation quality of incident photon radiation. The reference radiation quality is that of ^{60}Co gamma radiation in the water phantom. The correction factor k_Q is determined. (orig./DG).

24458 (PTB-Dos–21, pp. 67-79) **Comparative measurements using chemical dosemeters, and extension of compulsory calibration to include high energies.** Schneider, M.K.H. (Physikalisch-Technische Bundesanstalt, Braunschweig (Germany)). Physikalisch-Technische Bundesanstalt, Braunschweig (Germany). Dosimetrie. Aug 1992. (In German). (CONF-9111318–: 95. PTB seminar 'Dose measurement techniques for high-energy photon and electron radiation', Braunschweig (Germany), 11-12 Nov 1991). In *Dose measurement techniques for high-energy photon and electron radiation. Proceedings.* 127p. Order Number DE93796871. Source: OSTI; NTIS (US Sales Only); INIS.

The extension of compulsory calibration of therapy dosemeters to include high-energy radiation is indicated. Extended compulsory calibration prescribes the use of dosemeters calibrated for cobalt gamma radiation, and obligatory participation in comparative measurements. Comparative measurements as a contribution to quality assurance in clinical dosimetry have proved successful, and their feasibility is shown by a measuring program using chemical dosemeters. (orig./DG).

24459 (PTB-Dos–21, pp. 80-86) **Future development of the demands on therapy dosemeters with ionization chambers.** Schneider, U. (Physikalisch-Technische Bundesanstalt, Braunschweig (Germany)). Physikalisch-Technische Bundesanstalt, Braunschweig (Germany). Dosimetrie. Aug 1992. (In German). (CONF-9111318–: 95. PTB seminar 'Dose measurement techniques for high-energy photon and electron radiation', Braunschweig (Germany), 11-12 Nov 1991). In *Dose measurement techniques for high-energy photon and electron radiation. Proceedings.* 127p. Order Number DE93796871. Source: OSTI; NTIS (US Sales Only); INIS.

Only little will change with the introduction of the European internal market with regard to the demands on ionization chamber dosemeters used in radiotherapy, provided that the harmonized standard is aligned with IEC publication 731. Type licences for domestic calibration will be replaced by European Communities licences. (orig.).

24460 (PTB-Dos–21, pp. 87-96) **The correction factor k_E for electron radiation quality.** Christ, G. (Tuebingen Univ. (Germany). Medizinische Physik). Physikalisch-Technische Bundesanstalt, Braunschweig (Germany). Dosimetrie. Aug 1992. (In German). (CONF-9111318–: 95. PTB seminar 'Dose measurement techniques for high-energy photon and electron radiation', Braunschweig (Germany), 11-12 Nov 1991). In *Dose measurement techniques for high-energy photon and electron radiation. Proceedings.* 127p. Order Number DE93796871. Source: OSTI; NTIS (US Sales Only); INIS.

In ionization dosimetry, correction factors take into account the deviations from conditions during measurements on the one hand and conditions of calibration on the other hand. One of these correction factors is k_E which considers the influence of electron radiation quality. Two aspects are covered, namely the different stopping power ratio of water to air with regard to the interesting electron radiation compared to ^{60}Co radiation, and the different field disturbances under measurement and calibration conditions. The importance of correction factor k_E and various ways to determine this quantity are shown. (orig./DG).

24461 (PTB-Dos–21, pp. 97-111) **Dosimetry from the point of view of clinical physicists - practical implementation and problems.** Scheffler, A. (Klinikum Steglitz, Berlin (Germany). Abt. Strahlentherapie). Physikalisch-Technische Bundesanstalt, Braunschweig (Germany). Dosimetrie. Aug 1992. (In German). (CONF-9111318–: 95. PTB seminar 'Dose measurement techniques for high-energy photon and electron radiation', Braunschweig (Germany), 11-12 Nov 1991). In *Dose measurement techniques for high-energy photon and electron radiation. Proceedings.* 127p. Order Number DE93796871. Source: OSTI; NTIS (US Sales Only); INIS.

Dosimetry of a linear accelerator is understood to be the acquisition of basic data for therapy planning, and of initial values for constance tests of the calibration of dose monitors. The basic data for therapy planning are divided into 'point data' and 'dose distributions'. Point data are dose values on the axis of the useful beam at selected points, for instance at the reference depth or the depth of the maximum dose on the axis of the useful beam. The representations concentrate on the description of point data and their acquisition. (orig./DG).

24462 (SSCL-Preprint–258) **System-level description of the SDC detector.** Wells, N. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–17: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE93014080. Source: OSTI; NTIS; INIS; GPO Dep.

The detector being designed by the Solenoidal Detector Collaboration (SDC) is an eight with 8.5 million sensor elements. The positions of these elements must be known to less than one millimeter accuracy to meet the physics requirements. However, this 75-million pound experimental device could settle up to 20 millimeters and the entire detector, as well as its components, must be moveable to align with the proton beam and to accommodate detector and floor deflections. Interesting engineering challenges are presented as the detector is designed. The management challenge of integrating the work of about 1000 physicists and engineers at institutions around the world is also significant. The coordination process is being facilitated by the publishing of a reference book for detector designers, the SDC Detector Parameters Book that contains the latest design information. It was used as the source of detector data contained in this paper (unless otherwise indicated). This paper describes some of the systems issues that are being faced as the detector is designed. After the detector is described, the foundation requirements are reviewed and the method of keeping the detector aligned with the proton beam described. A discussion of detector operations and maintenance completes the paper.

24463 (UCRL-ID–112223) **Gamma-insensitive optical focal plane array.** Kruger, H. Lawrence Livermore National Lab., CA

(United States). Oct 1992. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93013100. Source: OSTI; NTIS; GPO Dep.

Two types of optical focal plane array concepts are proposed which use semitransparent photocathodes and gas avalanche multiplication to count an optical photon or a gamma as submicrosecond pulses with a charge that can be adjusted to be as large as 106 electrons. Avalanche diameters are sufficiently small to allow use of pixel sizes of tens of microns. Currently available photocathode materials permit operation at ultraviolet/visible wavelengths with ~10–20% quantum efficiency and in the near-infrared with ~0.1–0.3% quantum efficiency. The dark current of these photocathodes is sufficiently low so that they can be operated at room temperature. The weight of these gas avalanche focal plane designs is small and negligible compared to that required for data processing. The first concept, using a quartz cathode plate, is a relatively simple mechanical design. It detects a gamma mainly through the Cerenkov photons radiated in the quartz by the high-energy end of the gamma-produced Compton electron spectrum. It can operate in a high gamma flux; however, it has little capability to discriminate between optical photon and gamma counts. The second concept uses scintillating fiberoptic cathode and anode plates to detect all the gamma-produced electrons. It is a more complicated design; however, it is inherently capable of discriminating between optical photon and gamma events on the basis of pulse height and pixel count pattern. It can operate in a gamma flux of 10^{10} to 10^{11} gammas/cm^2/sec if built with scintillating glass fibers. Use of plastic scintillation fibers increases the tolerable gamma flux to ~10^{12}–10^{13} gammas/cm^2/sec, but makes the mechanical design of the gas avalanche focal plane array more difficult. Prototype gas avalanche focal plane arrays need to be built and tested to verify feasibility of this optical sensor concept.

24464 (UCRL-ID–112587) **Metal-semiconductor, composite radiation detectors: FY92 progress report.** Orvis, W.J.; Yee, J.H.; Fuess, D. Lawrence Livermore National Lab., CA (United States). Dec 1992. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93013313. Source: OSTI; NTIS; INIS; GPO Dep.

In 1989, Naruse and Hatayama of Toshiba published a design for an increased efficiency x-ray detector. The design increased the efficiency of a semiconductor detector by interspersing layers of high-z metal within it. Semiconductors such as silicon make good, high-resolution radiation detectors, but they have low efficiency because they are low-z materials (z = 14). High-z metals, on the other hand, are good absorbers of high-energy photons. By interspersing high-z metal layers with semiconductor layers, Naruse and Hatayama combined the high absorption efficiency of the high-z metals with the good detection capabilities of a semiconductor. This project is an attempt to use the same design to produce a high-efficiency, room temperature gamma ray detector. By their nature, gamma rays require thicker metal layers to efficiently absorb them. These thicker layers change the behavior of the detector by reducing the resolution, compared to a solid state detector, and shifting the photopeak by a predictable amount. During the last year, the authors have procured and tested a commercial device with operating characteristics similar to those of a single layer of the composite device. They have modeled the radiation transport in a multi-layered device, to verify the initial calculations of layer thickness and composition. They have modeled the electrostatic field in different device designs to locate and remove high-field regions that can cause device breakdown. They have fabricated 14 single layer prototypes.

24465 (UCRL-JC–107306) **A fiber optic array for continuous energy coverage in a gamma ray spectrometer.** Cochran, C.W. (Lawrence Livermore National Lab., CA (United States)); Kammeraad, J.E.; Sale, K.E.; Lown, J.G.; Robson, J.D.; Marroquin, J.P.; Sanchez, A. Jr. Lawrence Livermore National Lab., CA (United States). Jul 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920792–54: Society of Photo-Optical Instrumentation Engineers (SPIE) international symposium on optical applied science and engineering, San Diego, CA (United States), 19-24 Jul 1992). Order Number DE93012489. Source: OSTI; NTIS; GPO Dep.

Optical fibers are being used to obtain full coverage over a range of energies in a multi-channel, time-resolved gamma ray spectrometer. Gamma rays are incident upon a beryllium foil 60cm from the entrance port of a Sm-Co magnet. Compton electrons from the foil are focussed according to their energy onto quartz optical fibers arrayed in close-packed configuration behind a low-Z vacuum window at the focal plane. Cerenkov radiation produced inside each of the fibers propagates down the fiber which is brought out of the magnet. Fibers are grouped into preselected energy bins corresponding to streak record channel assignments. The light from the fibers in an energy bin are combined into one signal and then transmitted to a streak camera with a specified number of channels. This unique optical fiber array serves both as the detector and as a means to define energy bins of our choosing for a streak camera recording system.

24466 (UCRL-JC–113380) **Resolution for Lanczos and Paige-Saunders inverses in tomography.** Berryman, J.G. Lawrence Livermore National Lab., CA (United States). Mar 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9305169–1: Stanford exploration project program review, Stanford, CA (United States), 17-21 May 1993). Order Number DE93012312. Source: OSTI; NTIS; GPO Dep.

Methods have been developed for computing both the model and data resolution matrices for iterative inverses such as those produced by the Lanczos and Paige-Saunders (LSQR) schemes for constructing linear inverses.

24467 (JINR–5-51-91, pp. 38-41) **Radiation hardness tests of a scintillating fiber calorimeter module.** Afanas'ev, S.V. (and others); Anisimov, Yu.S.; Kolesnikov, V.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1991. [64p.] In *JINR rapid communications: Collection.* Order Number DE93626358. Source: OSTI; NTIS (US Sales Only); INIS.

Scintillating fiber based electromagnetic calorimeter module has been tested on radiation hardness. Energy resolution worsened to 18.2% immediately after irradiation to a a dose 1.25 Mrad comparing with its initial value 5.4% while light output decreased by a factor of 2.75. Further degradation of the performance as well as partial recovering after rest was observed up to the dose of 7.5 Mrad. 2 refs.; 3 figs.

24468 (ANL/MSD/CP–78008) **Prism-film coupling in anisotropic planar waveguides of epitaxial (101) rutile thin films.** Foster, C.M.; Chan, S.K.; Chang, H.L.M.; Chiarello, R.P.; Lam, D.J. Argonne National Lab., IL (United States). Materials Science Div. Apr 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930405–4: Spring meeting of the Materials Research Society, San Francisco, CA (United States), 12-16 Apr 1993). Order Number DE93012912. Source: OSTI; NTIS; GPO Dep.

We report optical waveguiding in single-crystal, epitaxial (101) oriented rutile (TiO_2) thin films grown on (1120) sapphire (α-Al_2O_3) substrates using the MOCVD technique. The propagation-constants for asymmetric planar waveguides composed of an anisotropic dielectric media applicable to these films are derived. Modifications to the prism-film coupling theory for this anisotropic case are also discussed. By application of this model to (101) oriented rutile thin films, we directly obtain values of the ordinary and extraordinary refractive indexes, n_o and n_e, of the rutile thin films as well as film

thicknesses. We obtain typical values of the refractive indexes (n_o=2.5701±0.0005; n_e=2.934±0.001) near to those for bulk rutile single crystals indicating the exceptional quality of these films.

24469 (DOE/FTR–93013019) **Travel to Australia to participate in the the 24th international symposium on combustion: Foreign trip report, June 29–July 16, 1992.** Ottesen, D.K. Sandia National Labs., Livermore, CA (United States). 14 Aug 1992. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013019. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report summarizes the Proceedings of the 24th International Symposium on Combustion held in Sydney, Australia, July 5–10, 1992, and describes the current research activities in several important optical diagnostics groups in Australia including: (1) at the BHP Co. Newcastle Research Laboratories, the Sensing Technology R & D Division; (2) the Centre for Lasers and Applications within the School of Chemistry at Macquarie University; (3) the Laser Applications Group at the CSIRO, Division of Mineral and Process Engineering; and (4) the Minerals Research Laboratory at the CSIRO, Division of Coal and Energy Technology.

24470 (DOE/PC/92521–T31) **Development of an on-line image analysis for assessment of pyrite liberation: Technical report, December 1, 1992–February 28, 1993.** Yen, M.S.C. (Southern Illinois Univ., Carbondale, IL (United States)); Chu, P.T.C.; Ho, K. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). 1993. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-92PC92521. Order Number DE93013650. Source: OSTI; NTIS; GPO Dep.

An automation procedure based on the principles of image processing is proposed to perform the analysis of pyrite/minerals liberation of coal. To make the automated image analysis system possible, a data base of the light reflectance characteristics of different coal constituents must be established. Characterization of coal images through the analysis of their histogram was conducted. In general, it was found that the distinction of coal particles or particle groups may be accomplished by determining the gray levels of zero pixel or by taking average gray level of each particle. In particular, when the gray level averaging is applied, the spread of gray levels of a given maceral becomes smaller. In other words, the spread in gray level among different maceral group becomes larger. This has led to a distinct boundary between different material group of coal. Two computer programs based on these findings are being developed. The implementation of these criteria will cover most of the coal samples that are previously analyzed. Consideration of special cases will require additional data analysis of histogram.

24471 (LBL–33982) **New a-Si:H photo-detectors for long-term charge storage.** Lee, H.; Cho, G.; Drewery, J.S.; Hong, W.S.; Jing, T.; Kaplan, S.N.; Mireshghi, A.; Perez-Mendez, V.; Wildermuth, D. Lawrence Berkeley Lab., CA (United States). Apr 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-930405–9: Spring meeting of the Materials Research Society, San Francisco, CA (United States), 12-16 Apr 1993). Order Number DE93013909. Source: OSTI; NTIS; INIS; GPO Dep.

Using the high light absorption properties of amorphous silicon, we developed a new device configuration that can detect photons and store the induced charges for relatively long time. This device, coupled to a scintillator such as CsI(Tl) in an array form, could be used as a scintillation camera, or for long-term photo-detection such as radionuclide labeled chromatography. The detector has a simple sandwich structure consisting of a scintillator followed by a top metal layer, p-i-n layers of hydrogenated amorphous silicon (a-Si:H), a second metal layer, a thin insulating layer and a bottom metal layer. The electron-hole pairs generated in the i-layer by the interaction with the incident light will be separated by the imposed electric field and be stored in the central metal-insulator interface. Readout will be done by switching the external bias to ground after the storage time, which depends on the needs for the specific application. Prototype devices were fabricated and tested. The performances of the devices were analyzed in connection with the storage time and the background signal produced by the thermally generated charges.

24472 (SAND–93-0539C) **Application of normalized gray-scale correlation.** Yee, M. (Sandia National Labs., Albuquerque, NM (United States)); Dickey, F.M.; Stalker, K.T.; Kast, B.A. Sandia National Labs., Albuquerque, NM (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930445–12: Society of Photo-Optical Instrumentation Engineers (SPIE) OE/aerospace science and sensing meeting, Orlando, FL (United States), 11-16 Apr 1993). Order Number DE93013765. Source: OSTI; NTIS; GPO Dep.

Real-time gray-scale correlation in the spatial domain has been demonstrated previously using an acousto-optical (AO) correlator. This work demonstrates normalized gray-scale correlation as implemented on an AO correlator system capable of operating at real-time video rates. Motivation for using normalized gray-scale correlation is presented. The normalized correlation algorithm as implemented on the AO correlator is detailed. The entire real-time AO correlator system is described, including the electronic support hardware and the user interface. Since normalization requires a division operation, system numerical precision issues are addressed. Test results obtained in non-real time experiments are presented.

24473 (UCRL-JC–109342) **A Fabry–Perot microinterferometer for visible wavelengths.** Raley, N.F.; Ciarlo, D.R.; Koo, J.C.; Beiriger, W.J.; Trujillo, J.T.; Yu, C.M.; Loomis, G.M.; Chow, R. Lawrence Livermore National Lab., CA (United States). Apr 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9206172–3: Solid state sensor and actuator workshop, Hilton Head Island, SC (United States), 21-25 Jun 1992). Order Number DE93012478. Source: OSTI; NTIS; GPO Dep.

We report here on our efforts to develop a silicon-based microinterferometer for optical applications in the visible spectral region using micromachining fabrication techniques. The interferometer is formed by two parallel dielectric mirrors supported on membranes which are electrostatically deflected for wavelength control. A simplified two-wafer fabrication process has been designed and investigated. We have obtained 250 nm membrane deflection for an applied voltage of 100 V. Hafnium dioxide-silicon dioxide dielectric mirrors have been fabricated on membrane supports and also free-standing with high reflectivity and low stress. Optical transmission of fixed mirrors yield 1.6 nm spectral resolution at 450 nm wavelength with significant signal and selectivity. Anticipated applications include microinstrument spectroscopy systems for atomic absorption, ellipsometry, imaging, optical fiber communications, and general spectrophotometer uses as well as accelerometry.

24474 (UCRL-JC–109348) **Long wavelength characterization of internal quantum efficiency in LT–GaAs MSM photodiodes.** Morse, J.D.; Mariella, R.P. Jr. Lawrence Livermore National Lab., CA (United States). Dec 1991. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-911202–89: Annual fall meeting of the Materials Research Society, Boston, MA (United States), 2-6 Dec 1991). Order Number DE93012487. Source: OSTI; NTIS; GPO Dep.

Metal-Semiconductor-Metal (MSM) photodiodes fabricated from low temperature all grown GaAs by molecular beam epitaxy have been characterized for wavelengths extending out to 1.5μm. External quantum efficiencies on the order of 0.5 % have been measured for subbandgap wavelengths, which translates to internal quantum efficiencies of 2–4 % for the interdigitated electrode structure with 1μm finger spacing and width. Although the effective lifetime of the LT-GaAs has been determined to be <1ps, an MSM photodiode response of ~10ps full width at half maximum was measured by correlation techniques at 820 nm wavelength, and a system limited response of 3GHz was measured at 1.3 μm wavelength. These experimental results win be described in detail.

24475 (UCRL-JC–111388) **Damage threshold study of ion beam sputtered coatings for a visible high-repetition laser at LLNL.** Stolz, C.J.; Taylor, J.R. Lawrence Livermore National Lab., CA (United States). Oct 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921047–4: Symposium on optical materials for high-power lasers, Boulder, CO (United States), 28-30 Oct 1992). Order Number DE93013430. Source: OSTI; NTIS; GPO Dep.

Ion Beam Sputtered (IBS) coatings offer some distinct advantages over electron beam deposited (e-beam) coatings, namely environmental stability and extremely low total losses. Initial IBS coatings had excessive stress and low laser damage thresholds. For these reasons, a study was initiated to examine potential laser damage thresholds and stress of IBS coatings. A material study was conducted of IBS coatings produced in industry, and a variety of design techniques were explored to increase laser damage thresholds. A post annealing process and backside coatings were developed to reduce the coating stress.

24476 (UCRL-JC–112602) **A fast frame rate 512 × 512 CCD digital camera system.** Conder, A.; Mitchell, R.; Schulte, H. Lawrence Livermore National Lab., CA (United States). Jan 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930163–2: IS&T/SPIE symposium on electronic imaging science and technology, San Jose, CA (United States), 31 Jan - 5 feb 1993). Order Number DE93013048. Source: OSTI; NTIS; GPO Dep.

This paper details the performance and shows images obtained from a 512 x 512 CCD camera capable of recording 400 digitized frames per second. A brief description of the data acquisition hardware andimage analysis software is also included.

24477 (ANL/FC/CP–77793) **Remote real time x-ray examination of fuel elements in a hot cell environment.** Yapuncich, F.L. Argonne National Lab., Idaho Falls, ID (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930403–44: 5. topical meeting on robotics and remote systems, Knoxville, TN (United States), 26-29 Apr 1993). Order Number DE93009975. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the Remote Real Time X-ray System which will allow for detailed examination of fuel elements. This task will be accomplished in a highly radioactive hot cell environment. Two remote handling systems win be utilized at the examination station. One handling system will transfer the fuel element to and from the shielded x-ray system. A second handling system will allow for vertical and rotational inspection of the fuel elements. The process win include removing a single nuclear fuel element from a element fabrication magazine(EFM), positioning the fuel element within the shielding envelope of the x-ray system and transferring the fuel element from the station manipulator to the x-ray system manipulator, performing the x-ray inspection, and then transferring the fuel element to either the element storage magazine(ESM) or a reject bin.

24478 (CONF-920791–, pp. 6, Paper 32) **Portable acoustic wave sensors for voltaile organic compounds.** Frye, G.C. (Sandia National Labs., Albuquerque, NM (US)); Cernosek, R.W.; Martin, S.J. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

Portable acoustic wave sensor (PAWS) systems are being developed for real-time, on-line monitoring of volatile organic compounds (VOCs). These systems are built around surface acoustic wave (SAW) devices coated with viscoelastic polymers. Two independent responses of the SAW sensor, wave velocity and wave attenuation, are measured to provide information about the chemical species sorbed by the coating. Rapid, reversible detection of gas phase volatile organics has been demonstrated for process monitoring and waste minimization in environmentally conscious manufacturing (ECM) applications and for documenting contaminant concentrations in remediation efforts.

24479 (DOE/PC/90181–T8) **Particulate Flow Research Laboratory quarterly progress report, October 1, 1992–December 31, 1992.** Rosato, A.D.; Dave, R.N.; Fischer, I.S. New Jersey Inst. of Tech., Newark, NJ (United States). Particulate Flow Research Lab. 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC90181. Order Number DE93013071. Source: OSTI; NTIS; GPO Dep.

Only minor changes have been made to the one-transmitter model code since the last report. Most changes were small and improved either code legibility or speed. Several redundant calculations were removed from the inner loop of the program. We performed a series of experiments to determine how well the single-transmitter model matches the actual measured voltages, and how the differences between the predicted and actual behavior of the voltage in the antennas affects the inverse transformation. These experiments used many different linear trajectories and several different sets of calibration points. For most known trajectories we were able to reproduce the path from the measured voltages with an accuracy of no worse than two inches for the worst points. (Most points are substantially more accurate). We have, however, identified two problem regions. The model encounters difficulty when the transmitter crosses the plane of an antenna or when the transmitter is almost parallel to an antenna and is moving nearly parallel to that antenna.When the transmitter crosses an antenna the measured voltage is significantly higher than the model would predict. Currently we're attributing this to small asymmetries and extra wiring in the test transmitter that only becomes significant on a scale of a couple of inches. These will not be present in the actual transmitter. If the new, more symmetric transmitter still has this problem we have worked out an iterative scheme for selectively choosing which antennas to use to calculate the position of the sphere at a given place.

24480 (JINR-R–13-91-424) **A high-precision direct current measuring device over a kiloampere range.** Voevodin, M.A.; Gusakov, Yu.V.; Korukov, N.A.; Sajfulin, Sh.Z.; Yalovoj, I.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1991. [4p.] (In Russian). Order Number DE93626409. Source: OSTI; NTIS (US Sales Only); INIS.

In power supply systems a need arises for wide-band loading currents monitors with a not galvanic contact from a control circuit. The measuring device is a reaction self-regulation circuit with a compensation of the value of the measured parameter. The measuring device may find extensive application in measurements of supply currents magnets and accelerator lenses. 5 refs.; 2 figs.

24481 (ORNL/FTR–4215) **[Travel by ORNL personnel to Japan concerning testing of a field emission gun-transmission electron microscope and for discussion of electron holography]: Foreign trip report, March 13–20, 1992.** Allard, L.F. Oak Ridge National Lab., TN (United States). 6 Apr 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011108. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler visited the Hitachi Instruments Division (HID) factory in Katsuta, Japan, to test the HF-2000 FEG electron microscope prior to shipment to ORNL. A visit was also paid to the HARL in Hatoyama, Japan, to discuss electron holography and the requirements for a digital imaging system for high-resolution electron holography.

24482 Multiple-frequency acoustic wave devices for chemical sensing and materials characterization in both gas and liquid phase. Martin, S.J.; Ricco, A.J. To Dept. of Energy. 1991. Filed date 24 May 1991. USA patent application 7-705,408. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93011996. Source: OSTI; NTIS; GPO Dep.

This invention consists of a chemical sensor that includes two or more pairs of interdigital electrodes having different periodicities. Each pair is comprised of a first electrode and a second electrode.

The electrodes are patterned on a surface of a piezoelectric substrate. Each pair of electrodes may launch and receive various acoustic waves (AW), including a surface acoustic wave (SAW), and may also launch and receive several acoustic plate modes (APMs). The frequencies associated with each are functions of the transducer periodicity as well as the velocity of the particular AW in the chosen substrate material. An AW interaction region exists between each pair of electrodes. Circuitry is used to launch, receive, and monitor the propagation characteristics of the AWs and may be configured in an intermittent measurement fashion or in a continuous measurement fashion. Perturbations to the AW velocity and attenuation are recorded at several frequencies and provide the sensor response.

24483 (RFP–4693) **An automated gas expansion system.** Abercrombie, K. EG and G Rocky Flats, Inc., Golden, CO (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. (CONF-930780–1: National conference of standards laboratories, Albuquerque, NM (United States), 25 Jul 1993). Order Number DE93012704. Source: OSTI; NTIS; GPO Dep.

The Metrology Laboratory at the Rocky Flats Plant has constructed a new Vacuum Gauge Calibration System based on gas expansion. The system is used to calibrate vacuum pressure gauges between 1 mTorr and 1000 mTorr. The paper discusses an overview of the system including layout, software, testing and performance.

24484 (SAND–92-2623C) **Micromachined chemical sensor with integrated microelectronics.** Smith, J.; Sniegowski, J.; Koehler, D.; Ricco, T.; Martin, S.; McWhorter, P. Sandia National Labs., Albuquerque, NM (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9305110–1: Expo 93, Oak Ridge, TN (United States), May 1993). Order Number DE93013761. Source: OSTI; NTIS; INIS; GPO Dep.

With today's continued emphasis on environmental safety and health issues, a resurgence of interest has developed in the area of chemical sensors. These sensors would typically be used to monitor contamination hazards such as underground storage tanks or to assess previous contamination at waste disposal sites. Human exposure to chemical hazards can also be monitored. Additionally, these sensors can be used as part of a manufacturing process control loop. One type of sensor suitable for gas phase monitoring of chemicals is the quartz resonator or quartz crystal microbalance (QCM) sensor. In this type of sensor, a thickness shear mode (TSM) quartz resonator is coated with a film that interacts with the chemical species of interest. Changes in the mass and elasticity of this film are reflected as changes in the resonant properties of the device. Therefore, the presence of the species of interest can be detected by monitoring the frequency of an oscillator based on the resonance of the quartz. These QCM sensors compete with surface acoustic wave (SAW) devices as a means for monitoring gas phase species. SAW devices are typically more sensitive to small amounts of a species, but the instrumentation associated with a SAW device is an order of magnitude more expensive than the instrumentation associated with a TSM wave resonator since the SAW devices operate in the 100's of MHz frequency regime while quartz resonators operate in the 5–25 MHz regime. We are working to improve the sensitivity of the QCM sensor by increasing the frequency of the device to 25 MHz (compared to the typical 5 MHz crystal) and by increasing the frequency stability of the system to an ultimate goal of 0.1 Hz. The 25 MHz QCM has already been achieved and once the stability goal is achieved, the QCM will have the same sensitivity as a SAW device.

24485 (SAND–92-8003) **Dynamic response of a transducer mounted at one end of an acoustical cavity.** Benedetti, G.A. Sandia National Labs., Livermore, CA (United States). Apr 1993. 67p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC04-76DR00789. Order Number DE93012837. Source: OSTI; NTIS; GPO Dep.

The dynamic response of a transducer mounted at one end of a one-dimensional acoustical cavity is determined. The cavity is filled with a compressible isentropic fluid, and the fluid at the open end of thecavity (i.e., the boundary at $x = 0$) is subjected to an axial displacement specified with respect to time. At the other end of the cavity the transducer is represented as a mass, spring, and damper system. Consequently, the boundary condition at $x = \ell$ is also time dependent. The general solution to the boundary value problem is obtained as well as the steady state solution for harmonic excitation. Since the steady state response for harmonic excitation is of particular interest, an analytical or closed form solution is obtained for the displacement and e and useful algebraic expression is obtained for pressure responsefunctions. In addition, a simple and useful algebraic expression is obtained for the steady state pressure-frequency response function for harmonic excitation. An approximate solution is also obtained for the dynamic response of a transducer mounted at one end of a two-diameter or stepped-recessed cavity. Stepped-recessed pressure transducer cavities, which may be grease-filled, are suitable for measuring quasi-static pressures in solid propellant guns and regenerative liquid propellant guns (RLPGs), provided the frequencies contained in the quasi-static pressure pulse are low relative to the fundamental frequency for the empty stepped cavity.

24486 (UCRL-ID–110108) **Sensing technology for pressure, flow, viscosity and moisture content monitoring in autoclave environments.** Beadles, J.R.; Spellman, G.P. Lawrence Livermore National Lab., CA (United States). Mar 1992. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93012388. Source: OSTI; NTIS; GPO Dep.

This report is an evaluation of sensor technology for continuously determining pressure, flow, viscosity, and moisture content of the resin in fiber composite laminates that are being cured in an autoclave. An effort has been made to identify the individuals and firms active in research and manufacture of such sensors. Monitoring technologies of interest include dielectric, fiber optic, strain gage, capacitive, ultrasonic, piezoelectric, nuclear magnetic resonance, resistance change, vibration, tracer/fluorescent particle analysis, and anemometer. The focus is on sensors that produce real-time data; techniques that rely on indirect correlations and modeling for estimates of effects are discussed only briefly.

24487 (UCRL-JC–109818) **Four-GHz analog data acquisition system using high-frequency guided-wave modulators.** Roeske, F.; Haigh, R.E.; Hugenberg, K.F.; Lowry, M.E.; Nelson, D.C. Lawrence Livermore National Lab., CA (United States). Aug 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9209184–8: The International Society for Optical Engineering (SPIE) meeting, Boston, MA (United States), 8-11 Sep 1992). Order Number DE93013041. Source: OSTI; NTIS; GPO Dep.

High-frequency modulators have been used to record very fast analog voltage pulses in the Nuclear Test Program at LLNL. A system consisting of 810 nm laser diode carrier sources, 7 GHz Y-branched, balanced bridge modulators (YBBM), a kilometer of single-mode optical fiber and a streak camera recorder has been successfully fielded. The total system −3db bandwidth is 4 GHz with a slow roll-off allowing the recoverable data capabilities of the system to approach 10 GHz. This system has provided us with a diagnostic tool that allows us to resolve high-frequency structure in our signals which has been calculated but never measured because of limitations in the resolution of previous measuring systems. A description of the system will be given with particular emphasis given to the YBBM modulator characteristics and performance. Fast pulse data recorded by the system will be shown and an indication of the accuracy with which the pulse can be reproduced will be provided. We expect this system to be a valuable tool that will be used regularly to study the physics of materials at extremely high temperatures and densities. Plans for upgrading the system to have a −3db bandwidth of 7–8 GHz will also be discussed.

24488 (UCRL-JC–110274) **Needs for super-smooth surfaces.** Saito, T.T. Lawrence Livermore National Lab., CA (United States). May 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9206297–2: International symposium on optical fabric testing and surface evaluation, Tokyo (Japan), 6 Jun 1992). Order Number DE93012482. Source: OSTI; NTIS; GPO Dep.

Understanding the needs for super smooth optics give insights for optical fabricators tasked to produce them. These needs include substrates for metrology and a host of X-ray applications. In addition to some grazing angle of incidence optics,, normal incidence optics with multilayer stacks have been recently produced. These optics have very demanding finish requirements. Lacquer and flow polishing have produced some interesting surfaces.

24489 (CONF-9302106–Summ.) **Interagency Advanced Power Group, Electrical Working Group meeting minutes.** Horizon Data Corp., Reston, VA (United States). Power Information Center. [1993]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-90CE90053. From Interagency Advanced Power Group (IAPG) electrical working group meeting; Palo Alto, CA (United States); 10-12 Feb 1993. Order Number DE93010899. Source: OSTI; NTIS; GPO Dep.

These minutes review the Electrical Working Group February 1993 meeting. An introduction by Gene Schwarze, Electrical Working Group Chairman, are followed by presentations from the superconductivity panel, the power conditioning panel and the pulse power panel. Closing comments and action items conclude the meeting.

24490 (LA-SUB–93-173) **USSOUTHCOM Counterdrug Modeling and Simulation System (CMASS) report: Final report.** Los Alamos National Lab., NM (United States); GPS Technologies, Inc. (United States). 31 Mar 1993. 149p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93012895. Source: OSTI; NTIS; GPO Dep.

USSOUTHCOM, in conjunction with Los Alamos National Labs (LANL), is in its second year of development of CMASS (Counterdrug Modeling and Simulation System). The purpose of this project is to provide an opportunity for the multiple agencies involved in the war on drugs to cooperate to simulate the various activities that must be coordinated and performed to meet the mission. LANL is providing development of computer-based support data and models to assist in gaming and strategies. Other contractors provide technology and program management support. Section 1 of this report provides observations and recommendations based on: numerous conversations with representatives from the various participating agencies and services; observation of two iterations of wargames held at the Joint Warfare Center, Hurlburt Field, FL; and reading and reviewing briefings and literature as provided by the program management office and by various agencies. Section 2 compares and contrasts two delivery media currently available in the Department of Defense.

24491 (ORNL/TM–12330) **Automatic ammunition identification technology test report for the Datamatrix and Code 49 symbologies: Ammunition Logistics Program.** Weil, B.S. Oak Ridge National Lab., TN (United States). Mar 1993. 68p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012511. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A series of tests was conducted to evaluate the two-dimensional bar codes called Datamatrix and Code 49. Two-dimensional bar codes are being considered for use in ammunition logistics systems and automated reloading equipment. For this reason, the purpose of these evaluations was to determine the capabilities and limitations of the existing symbology and decoding hardware as they pertain to the diverse and harsh field environment in which they maybe used for, ammunition identification. The tests conducted and their results are presented in this report.

24492 (SAND–92-2086C) **Feature discovery on segmented objects in SAR imagery using self-organizing neural networks.** Fogler, R.J. (Sandia National Labs., Albuquerque, NM (United States)); Koch, M.W.; Moya, M.M.; Hush, D.R. Sandia National Labs., Albuquerque, NM (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930445–1: Society of Photo-Optical Instrumentation Engineers (SPIE) OE/aerospace science and sensing meeting, Orlando, FL (United States), 11-16 Apr 1993). Order Number DE93010685. Source: OSTI; NTIS; GPO Dep.

In this paper we investigate the applicability of the feature extraction mechanisms found in the neurophysiology of mammals to the problem of object recognition in synthetic aperture radar imagery. Our approach is to present multiple views of objects to be recognized to a two-stage self-organizing neural network architecture. The first stage, a two-layer Neocognitron, performs feature extraction in each layer The resulting feature vectors are presented to the second stage, an ART-2A classifier self-organizing neural network which clusters the features into multiple object categories. The feature extraction operators resulting from the self-organization process are compared to the feature extraction mechanisms found in the neurophysiology of vision. In a previous paper, the Neocognitron was trained on raw SAR imagery. The architecture was able to recognize a simulated vehicle at arbitrary azimuthal orientations at a single depression angle while rejecting clutter as well as other vehicles. Feature extraction on raw imagery yielded features that were robust but very difficult to interpret. In this paper we report the results of some new experiments in which the self-organization process is applied separately to shadow and bright returns from objects to be recognized. Feature extraction on shadow returns yield oriented contrast edge operators suggestive of bipartite simple cells observed in the striate cortex of mammals. Feature extraction on the specularity patterns in bright returns yield a collection of operators resembling a twodimensional Haar basis set. We compare the performance of the earlier two-stage neural network trained on raw imagery with a modified network using the new feature set.

24493 (SAND–92-2515C) **The experimental determination of impact forces for modeling of armored vehicle survivability.** Bateman, V.I.; Norwood, F.R.; Carne, T.G. Sandia National Labs., Albuquerque, NM (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9303164–1: 4. annual TOCOM combat vehicle survivability symposium, Gaithersburg, MD (United States), 30 Mar - 1 apr 1993). Order Number DE93012857. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A technique to reconstruct dynamic forces applied to structures from measured accelerometer data has been developed at Sandia National Laboratories. This technique is called the Sum of Weighted Accelerations Technique or SWAT. Forces have been successfully reconstructed for the impact limiters on a nuclear transportation cask, the energy-absorbing nose for a simulated bomb, and a lumped mass beam structure. The application of this technique to an armored vehicle hull representation (AVHR) is being studied using an analytical model. This model uses a hydrodynamic code, CTH, to model a projectile penetration, and a transient solid dynamics code, PRONTO, for analyzing the structural response. This analytical model is being used to determine the feasibility of force reconstruction for armored vehicle structures.

24494 (SAND–92-2716C) **Cut-off insensitive guidance with variable time of flight.** White, J.E. Sandia National Labs., Albuquerque, NM (United States). 12 Jan 1993. 9p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930861–1: American Institute of Aeronautics and Astronautics (AIAA) guidance, navigation, and control conference, Monterey, CA (United States), 9-11 Aug 1993). Order Number DE93006764. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A guidance strategy is proposed for reducing target miss produced by performance uncertainty in the final stage of ballistic missile systems that do not have thrust termination or other velocity control capability. The approach taken here is to turn the thrusting missile onto a null range direction such that performance uncertainty contributions to target miss are reduced. The guidance

algorithm proposed here does not constrain time-of-flight. Since time-of-flight normally varies with thrusting flight along a null range direction, the result is a guidance solution that does not change rapidly near the end of the motor burn. This guidance procedure is a variation of an iterative Lambert guidance scheme that can be used to provide a position constraint with a nearly constant bum attitude by allowing a variable time-of-flight.

24495 (SAND–92-2845C) **3-D massively parallel impact simulations using PCTH.** Fang, H.E.; Robinson, A.C. Sandia National Labs., Albuquerque, NM (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930765–2: SCSC '93: summer computer simulation conference, Boston, MA (United States), 19-21 Jul 1993). Order Number DE93011593. Source: OSTI; NTIS; GPO Dep.

Simulations of hypervelocity impact problems are performed frequently by government laboratories and contractors for armor/anti-armor applications. These simulations need to deal with shock wave physics phenomena, large material deformation, motion of debris particles and complex geometries. As a result, memory and processing time requirements are large for detailed, three-dimensional calculations. The large massively parallel supercomputing systems of the future will provide the power necessary to greatly reduce simulation times currently required by shared-memory, vector supercomputers. This paper gives an introduction to PCTH, a next-generation shock wave physics code which is being built at Sandia National Laboratories for massively parallel supercomputers, and demonstrates that massively parallel hydrocodes, such as PCTH, can provide highly-detailed, three-dimensional simulations of armor/anti-armor systems.

24496 (SAND–93-0306) **Extensions of "Some guidelines for the mechanical design of coaxial compression pin seals".** Chambers, R.S.; Burchett, S.N. Sandia National Labs., Albuquerque, NM (United States). Mar 1993. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012385. Source: OSTI; NTIS; GPO Dep.

Compression seals are commonly used in electronic components. Because glass has such a low fracture toughness, tensile residual stresses must be kept low to avoid crackS. N. Burchett analyzed a variety of compression pin seals to identify mechanically optimal configurations when work hardened Alloy 52 conductor pins are sealed in a 304 stainless steel housing with a Kimble TM-9 glass insulator. Mechanical property tests on Alloy 52, have shown that the heat treatments encountered in a typical glass sealing cycle are capable of annealing the Alloy 52 pins, increasing ductility and lowering the yield strength. Since most seal analyses are routinely based on unannealed Alloy 52 properties, a limited study has been performed to determine the design impact of lowering the yield strength of the pins in a typical compression seal. Thermal residual stresses were computed in coaxial compression seals with annealed pins and the results then were used to reconstruct design guidelines following the procedures employed by Miller and Burchett. Annealing was found to significantly narrow the optimal design range (as defined by a dimensionless geometric parameter). The Miller-Burchett analyses which were based on very coarse finite element meshes and a 50 ksi yield strength fortuitously predicted an overly conservative design range that is a subset of the narrow design window prevalent when the yield strength is assumed to be 34 ksi. This may not remain true for lower yield strengths. The presence of pin wetting was shown to exacerbate the glass stress state. The time is right to develop a modern and enhanced set of design guidelines which could address new material systems, three dimensional geometries, and viscoelastic effects.

24497 (SAND–93-0858) **Improved Many-On-Many ROUTE software description.** Ormesher, R.C. Sandia National Labs., Albuquerque, NM (United States). Apr 1993. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013961. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report describes the models and algorithms used in the Air Force Electronic Warfare Center's (AFEWC's) Improved Many-on-Many (IMOM) ROUTE simulation software. ROUTE simulates an attack aircraft as it penetrates enemy territory that is protected by ground-based search and tracking radars and ground-to-air defensive weapon systems. Self-protection and stand-off jamming are also modelled in the simulation. The overall algorithm for computing the effectiveness of several radars on a single aircraft is described. In particular, the algorithms and mathematical models for calculating the radar range equation, terrain effects using DMA mapping information, weapon system performance, and geometry are described. In addition, the mathematical models and algorithms for calculating the degradation of early-seaming, target-acquisition, fire-control, height-finding, and target-tracking radars due to stand-off and self-protection jammers are described. This document will be useful for analysts who use IMOM and for software developers who modify and extend IMOM's capabilities. Our analysis has examined and validated the theoretical bases for the IMOM ROUTE simulation and its implementation in the software. During the analysis, questions, comments, and concerns were communicated to AFEWC.

24498 (SAND–93-0991C) **Fusion of LADAR and SAR for terminal guidance.** Cress, D.; Mastin, G. Sandia National Labs., Albuquerque, NM (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930445–11: Society of Photo-Optical Instrumentation Engineers (SPIE) OE/aerospace science and sensing meeting, Orlando, FL (United States), 11-16 Apr 1993). Order Number DE93012345. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A concept for integrating the airborne sensing capabilities of Synthetic Aperture Radar (SAR) with LAser Detection And Ranging (LADAR) for terminal guidance is presented. The advantages of each technology in the reconnaissance and terminal guidance roles for target acquisition are exploited. The concept is directed at terminal guidance against fixed and quasi-fixed targets (i. e. targets expected to be in approximately the same location and orientation from the time of reconnaissance to the time of targeting). The advantages of airborne SAR are high resolution, all-weather, standoff reconnaissance capabilities. The advantages of LADAR are high resolution in the real aperture mode using moderately sized and priced optics, and good performance over modest ranges (on the order of a kilometer or less). Within the concept, LADAR would provide terminal guidance using two SAR provided data sets: (1) target estimated, and (2) the SAR imagery of target/surround. Technical risk are: lack of a demonstrated capability for SAR-to-LADAR image correlation, lack of analysis of low-cost, light weight LADAR and real-time correlators, and lack of analysis of adequate signal-to-noise in a range of atmospheric environments. This paper is directed at the use of SAR image by the LADAR for aim point refinement. It addresses geometric differences in the SAR and LADAR images, the effect of different reflectances on scene segmentation, and the basis for an approach for developing common geometric projections for the SAR and LADAR image correlations.

24499 (UCRL-ID–111265) **Conventional Strategic Deterrence.** Latter, A.L.; Martinelli, E.A.; Speed, R.D. Lawrence Livermore National Lab., CA (United States). Aug 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93012444. Source: OSTI; NTIS; GPO Dep.

The Bush Administration argues that the US, as the world's only remaining superpower, must be prepared to intervene militarily in regional conflicts. However, the traditional American way of fighting-relying on ground forces with heavy equipment, supported by naval and air forces–could prove too expensive, both monetarily and in terms of expected American casualties, to garner the support of the American public or Congress. This paper argues that the revolution in conventional weaponry demonstrated in the Persian Gulf War opens up the possibility of a new strategy–called Conventional Strategic Deterrence–that could reduce both financial costs and casualties (if it were necessary to implement the strategy) while still being a strong and credible deterrent to regional conflict.

24500 (UCRL-ID–111898) **Flow visualization of shock propagation in baffle systems.** Kuhl, A.L. (Lawrence Livermore

National Lab., El Segundo, CA (United States)); Reichenbach, H. Lawrence Livermore National Lab., CA (United States). Sep 1992. 18p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. Contract DNA-IACRO 92-824;Contract DNA 001-91-C-0039. Order Number DE93013312. Source: OSTI; NTIS; GPO Dep.

There is renewed interest in blast propagation in multi-chamber systems, related to the vulnerabilities of buried bunker systems to conventional weapons effects. In this short report, the authors suggest some idealized test problems that can be used to evaluate the accuracy of computer code calculations of such problems. The generic problem selected was that of shock wave propagation through a baffle system – either aligned baffles or staggered baffles – as shown schematically in a figure. Here results of shock tube experiments performed previously in the Ernst-Mach-Institut are reported.

24501 (UCRL-JC–107113) **Single crystal tungsten kinetic energy penetrators.** Cline, C.F.; Gogolewski, R.P. Lawrence Livermore National Lab., CA (United States). May 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920689–6: Symposium on ballistics, Stockholm (Sweden), 1-3 Jun 1992). Order Number DE93012570. Source: OSTI; NTIS; GPO Dep.

We have explored the terminal ballistic performance of single crystal tungsten as a kinetic energy penetrator. Scientific speculation as to the anticipated penetration performance and nature of the interaction between such a kinetic energy penetrator and semi-infinite and spaced metallic targets has led us to perform laboratory scale experiments and metallographic examinations of post-impact penetrator materials. The single tungsten crystals were ground into kinetic energy penetrators with the ⟨111⟩ and ⟨100⟩ crystal direction being coincident with the axis of symmetry of the penetrators. The crystals were electro-polished to their final diameter. We, compared the terminal performance at current ordnance speeds of ⟨111⟩ single crystal tungsten to 90W-10 (NiFe) cemented tungsten and textured pure tungsten in laboratory scale ballistic experiments against a spaced steel (triple) target at sixty-five degrees obliquity. We also compared the terminal performance of ⟨100⟩ and ⟨111⟩ single crystal tungsten with 90W-10 and 98W02 (NiFe) cemented tungsten and textured pure tungsten in laboratory scale ballistic experiments against monolithic 4340 alloy steel (HRC = 36) at normal impact. We radiographed the penetrators during the interactions with the targets, we recovered portions of the penetrators after the ballistic experiments, and we conducted metallographic examinations of penetrator remnants. From the radiographic records and the metallographic examinations, we drew conclusions pertaining to insights into the terminal interactions of the penetrators with the targets and suggestions as to improved compositions of the cemented tungsten penetrators.

24502 (UCRL-JC–107850) **Tools and techniques for estimating high intensity RF effects.** Zacharias, R.; Pennock, S.; Poggio, A.; Ray, S. Lawrence Livermore National Lab., CA (United States). Jul 1991. 8p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9110492–1: Institute of Electrical and Electronics Engineers/American Institute of Aeronautics and Astronautics (IEEE/AIAA) digital avonics system conference, Los Angeles, CA (United States), 14-17 Oct 1991). Order Number DE93012604. Source: OSTI; NTIS; GPO Dep.

With the ever-increasing dependence of modern aircraft on sophisticated avionics and electronic controls, the need to assure aircraft survivatality when exposed to high Intensity RF (HIRF) signals has become of great Interest. Advisory regulation is currently being proposed which would require testing and/or analysis to assure RF hardness of installed flight critical and flight essential equipment. While full-aircraft, full-threat testing may be the most thorough manner to assure survivability, it is not generally practical in loins of cost. Various combinations of limited full-aircraft testing, box-level testing, modeling, and analysis are also being considered as methods to achieve compliance. Modeling, analysis, and low power measurements may hold the key to making full-system survivability estimates at reasonable cost. In this paper we will describe some of the tools and techniques we use for estimating and measuring coupling and component disturbance. A finite difference time domain modeling code, TSAR, used to predict coupling will be described. This code has the capability to quickly generate a mesh model to represent the test object. Some recent applications as well as the advantages and limitations of using such a code will be described. We will also describe some of the facilities and techniques we have developed for making low power coupling measurements and for making direct injection test measurements of device disturbance. Some scaling laws for coupling and device effects will be presented. A method to extrapolate these low-power test results to high-power full-system effects will be presented.

24503 (UCRL-JC–109857) **The urban combat computer assisted training system, UCCATS.** McGuigan, D.L. Lawrence Livermore National Lab., CA (United States). 30 Mar 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920771–6: 1992 summer computer simulation conference, Reno, NV (United States), 27-30 Jul 1992). Order Number DE93012590. Source: OSTI; NTIS; GPO Dep.

With the ability to represent individual buildings with one decimeter accuracy on a 100 kilometer square battlefield, UCCATS provides a unique capability for training combat forces. Combat situations that transition from rural to urban environments are easily supported. The high resolution terrain is coupled with an item system resolution paradigm for combat adjudication. The simulation core is only one component of an integrated system that includes database preparation utilities and an integrated after action reporting capability.

24504 (CONF-921275–, pp. 25-26) **Hazard evaluation on organic peroxides.** Jinnouchi, T. (Nippon Oil and Fats Co. Ltd., Tokyo (Japan)); Shimizu, M. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Organic peroxides utilized as polymerization starting agent and hardening agent have on the other hand a danger of fire and explosion. This paper describes investigations on readiness and activeness of heat decomposition in about 40 kinds of organic peroxides that have alkyl groups and aralkyl groups. Readiness of heat decomposition occurrence was investigated by measuring decomposition temperatures and decomposition heat at a heating rate of 10°C/min using a heat analyzing and testing equipment. A pressure container test measured pressures generated when the materials were heated at a rate of 30°C/min in a container. Further, the materials were charged and detonated in a mortar to measure mortar deflection angles and compare the powers with the TNT explosive. Looking at a 10-hour half-life temperature T10 that represents heat decomposition activity revealed that there are materials either showing or not showing decomposition activities depending on chemical compositions; the temperature T10 has in many cases a good correlation with decomposition temperatures derived from heat analysis; and active oxygen and CO groups can serve as a reference for activeness and power of decomposition. 3 figs., 2 tabs.

24505 (CONF-921275–, pp. 27-28) **Hazard evaluation on mixed contacts in reaction reagents.** Takenouchi, H. (Fujisawa Pharmaceutical Co. Ltd., Osaka (Japan)); Shima, K.; Inoue, S.; Nakamura, H. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Scaling up an organics synthetic reaction requires detailed hazard evaluation that takes into account actual operating conditions, in addition to using literature information on individual reaction reagents. This paper reports results of a mixed contact hazard evaluation on two kinds of reagents used relatively generally. The

test consists of heat analysis, time-based measurement of temperatures in liquid mixtures placed in a Dewar bottle, and video observation. A condensed liquid mixture of methachlor perbenzoic acid (m-CPBA) and dimethylformamide (DMF) decomposed and generated heat vigorously at around 70°C in a Dewar bottle test, and reached 180°C to 190°C. This heat storage and decomposition phenomenon was thought a result of a specific reaction of m-CPBA + DMF system, rather than from effects of impurities contained in the m-CPBA. A hazard test subsequently carried out on mixed contacts of t-BuOK with various solvents provided new findings including that no danger of ignition with water can be recognized, occurrence of which had been indicated previously. 1 ref., 5 figs., 1 tab.

24506 (CONF-921275–, pp. 65-68) **Electrostatic dust ignition mechanism for priming materials. 2.** Kuroda, E. (Nippon Koki Co., Tokyo (Japan)); Nagaishi, T. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Easiness in igniting explosives and priming materials is measured using electrostatic discharge. Subsequent to the previous report in which sensitivity characteristics of aluminum to an electrostatic dust ignition mechanism were reported, this paper describes discussions on mixture system of magnesium and an oxidizer. The test used a fixed electrode device consisting of an upper electrode of a phonograph record needle and a rod-shaped lower electrode with a diameter of 6 mm, magnesium powder for a test specimen, and triferric tetroxide for an oxidizer. The powder was placed on the lower electrode flatly and thinly to 1 mm or less. Discharges were performed with capacitors with 4,000 pF to 30,000 pF, series resistors with 2 k ohm to 400 k ohm, and electrode distances from 0.02 mm to 3 mm. The conclusions indicated that magnesium has much higher sensitivity than aluminum, and has short apparent time constants. The minimum 50% igniting energies for both materials were 100 m joule and 1 m joule, respectively. The mixture system of magnesium with the oxidizer was still more sensitive with the energy of about 0.3 m joule. 2 refs., 7 figs.

24507 (CONF-921275–, pp. 69-70) **Evaluation on explosion force of solid substances by measuring detonation pressures.** Miyake, A. (Yokohama National University, Yokohama (Japan). Faculty of Engineering); Ogawa, T. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Detonation characteristics of condensed-system explosive materials are expressed by detonation rate, pressure, and temperature as important parameters. The pressure and the temperature have been calculated generally from the detonation rate according to theoretical calculations. However, the calculation uses an ideal detonation as its prerequisite, whereas in this paper discussions were given on non-ideal detonation in an emulsion explosive that exhibits non-ideal detonation by measuring directly the detonation rate and the pressure under different conditions. The explosive used for the experiment was an emulsion comprising ammonium nitrate, wax, and water, added with an adequate amount of glass micro balloon. The detonation rates were measured using an ion gap method, and the detonation pressures by using an experimental device that uses a manganin gauge made from piezo resistance elements. As a result of discussing the detonation characteristics in various ways using the method and the device, the detonation rates showed values equivalent to experimental and calculated values as referred to in literatures, while the detonation pressures showed lower values than the calculations, indicating the detonating condition being non-ideal. 1 ref., 5 figs.

24508 (CONF-921275–, pp. 75-78) **Measurement of ignition points in spontaneously reactive substances.** Kaneko, Y.; Aimoto, H.; Katsuhara, I.; Ogai, A. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

A difference was investigated between the ignition point testing method in the quasi-ASTM method which improved part of the ASTM method and the Krupp ignition point testing method which is used frequently for explosives. The test specimens included nitro compounds and 12 other kinds of spontaneously reactive solid substances. While the ASTM method uses the explosives in an amount from 50 mg to 150 mg, this study limited it to 20 mg at maximum. An ignition temperature was established as a lowest temperature at which an ignition waiting time after the test specimen has been charged is five minutes or longer. With the Krupp method, a temperature for a four-second waiting time (ignition point AIT_K) was sought from a straight line plotted with inverse numbers of the absolute temperature and logarithms for the ignition waiting time. As a result, it was recognized that some of the spontaneously reactive substances disable plotting the numbers with use of the time-temperature relationship in the Krupp method; that the ASTM method has a limitation for measuring the test specimen amount and the ignition waiting time if the test specimen is a solid substance; and the ignition points have a good linear relationship in the values obtained from both methods. 5 figs., 4 tabs.

24509 (CONF-921275–, pp. 101-104) **Study on vapor explosiveness of molten LiCl-water system.** Umetsu, T. (Yokohama National University, Yokohama (Japan). Faculty of Engineering); Otani, H.; Uehara, Y. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Although vapor explosion that occurs when a high-temperature liquid contacts a low-temperature liquid is known in the metal industry, no sufficient knowledges have been attained on its generation mechanism. Subsequent to the previous report that investigated explosion probabilities and forces of vapor explosions of an Li-Cl-water system, the present paper discusses behavior of the pressures generated from single drop explosion. Molten test sample in a crucible with a bottom plug was dripped into a tank filled with 2000 cm^3 of water at a fixed temperature, and pressure changes in the water were measured using a pressure converter located at the bottom of the tank. Signals were transmitted and processed in a wave memorizer and a personal computer. The experimental result may be summarized as follows: The shape of a pressure waveform in a region with molar heat exergy of the molten LiCl from about 30.5 to 32 kJ/mol differs from that in other regions; and when the heat exergy of the molten LiCl increases, the maximum value for a largest generated pressure increases, but there may be occasions that the generated pressure is small. 4 refs., 6 figs.

24510 (CONF-921275–, pp. 105-106) **Flash reducing performance and explosion force dissipating effect of a metal-screen type flame arrestor.** Suzuki, Y. (Yokohama National University, Yokohama (Japan). Faculty of Engineering); Miyake, A.; Ogawa, T. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Flame arrestors to block flame propagation have not necessarily been elucidated of the reasonability of their design formulas. This paper describes experimental discussions on effects of the number of metal screens and the clearance between the screens on flame reducing performance of a multi-layer metal-screen type flame arrestor. An explosion pipe with a diameter of 100 mm was partitioned by a metal screen at its center, and electric spark was used as the ignition source. Propane-air mixture gas was used, and the flame velocity was adjusted by varying the propane concentration. The flame velocity was detected by an optical fiber and a photo diode, and the average velocity was assumed as the entering velocity of a flame into the flame arrestor. When the flame is quenched, the downstream flame velocity is zero. An experimental expression for the flame reducing performance of the flame arrestor was obtained from the experimental result, using a shape coefficient of the metal screen (wire diameter/mesh width). Such a finding was also obtained that the flame reducing performance on the propane-air mixture gas improves sharply with up to six metal screens according to the power function, but no changes in the

performance can be recognized even the number of the screen is increased. 5 figs.

24511 (CONF-921275–, pp. 109-112) **Effects of closed space height on pressure variation as a result of evaporation and ignition of combustible liquids.** Sato, K. (Toho University, Tokyo (Japan). Faculty of Science); Sakai, Y.; Nakagawa, K. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

For a purpose of assuring safety in storing and handling liquid fuels, combustion experiments have been carried out to identify characteristics of ignition and explosion of vapors of the liquid fuels. An experiment was performed in a more practical space, using a larger pressure vessel than that used in the experiments reported previously, to discuss effects of the vessel height on relation of evaporation time (τ) with pressure change and maximum pressure rise. Two kinds of vessels were used that have an inner diameter of 100 mm and heights (H) of 100 mm and 200 mm. They were held in a water bath to adjust temperatures. The test specimen used was 4 ml of methanol injected from the bottom center. The liquid was ignited with an electric spark generated 4 mm above the bottom, the pressure was measured using a strain gauge pressure converter, and the waveform was recorded digitally. A two-step pressure rise was recognized when τ is short, as also reported previously. Its appearance and the maximum pressure were considered to change in association with the temperature and H that affect the preliminary mixing. Even with the case where the H varies, the phenomena were put in order nearly consistently by means of introducing non-dimensionalized τ. 4 refs., 9 figs.

24512 (CONF-921275–, pp. 117-120) **Measurement of reaction limits of TEOS, H2, NH3 and ClF3.** Otani, H. (Yokohama National University, Yokohama (Japan). Faculty of Engineering); Uehara, Y.; Enomoto, T. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Studies have been carried out on explosion risks in gas mixtures of ClF3 used in semiconductor cleaning processes with combustible gases. Subsequent to the previous report that has investigated the dichloro silane system and the monosilane system, the present paper describes measurement of reaction limits of ethyl orthosilicate (TEOS), H2, NH3, and ClF3. In the case of H2, a premixture of H2, ClF3 and N2, and in the case of TEOS and NH3, vapor generated from the liquids in a flask, were guided directly into a reaction container and adjusted to predetermined concentrations. The reaction container is a pressure container with an inner diameter of 100 mm and a height of 120 mm, and the liquids were ignited electrically. As a result, the limit concentrations for the respective systems were plotted on a triangular diagram (for composition) to indicate that a limit of spontaneous ignition in, for example, ClF3/TEOS/N2 gas mixture was about 0.6% by volume in terms of the ClF3 concentration, and about 0.2% by volume in terms of the TEOS concentration. 4 refs., 9 figs.

24513 (CONF-921275–, pp. 121-122) **Ignition limit for hydrogen-air mixture gas on opening spark from hi-frequency electric circuit.** Motoyama, T. (Research Institute of Industrial Safety, Tokyo (Japan)). 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

A great number of studies have been reported on ignition limits for combustible gases on electric sparks, but many of them are about electric sparks in direct current or low frequency circuits. Taking accounts for high-frequency electrical devices used in hazardous atmosphere, this paper describes measurements of ignition limit for hydrogen-air gas mixture in a frequency range from 1 kHz to 1000 kHz using an IEC-type spark ignition testing device. The maximum number of opening of the electrodes was set to 3000 openings for each electrode, during which ignition and non-ignition were determined. The gas mixture is a hydrogen-air mixture with hydrogen concentration of 21.0% $\pm$ 2% by volume. The results of the experiment may be summarized as follows: The ignition voltage and its corresponding current increase as the frequency is increased; because the discharge is paused each time the current becomes zero, calculations that hypothesize that discharge energy in a half cycle relates with the ignition showed an identical trend; however, nearly all the measurements showed values smaller than the calculations. 2 refs., 3 figs.

24514 (CONF-921275–, pp. 135-136) **Reduction in vibration using precisely controlled blasting.** Wada, Y. (National Institute for Resources and Environment, Tsukuba (Japan)); Ogata, Y.; Katsuyama, K.; Nakajima, T.; Ogawa, T. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

The problem of vibration and stone scattering could be reduced by using stepped blasting. However, the step time that can be set in conventional MS and DS detonators is in the order of several ten microseconds, which is not sufficient for the control. This paper discusses the relationship between step times and vibration reduction by experimenting several blasting sources to control their blasting time in 1μs increments. An acrylic plate with a length of 35 cm, a width of 129 cm and a thickness of 2 cm was used as a vibration propagating media, and a precise exploder was used to control the blasting time in 1μs increments. Fuse heads and bridge circuit were prepared as vibration sources. In an experiment using two fuse heads for example, the optimal step time was found to be between 20μs and 28μs, and the maximum displacement rate was reduced to about 60% of that with a simultaneous blasting. It was verified that proper selection of the step time can reduce the vibration, and the maximum vibration value agrees well with calculations of the self-correlation function, suggesting that the correlation function may be able to determine the step time. 4 figs.

24515 (CONF-921275–, pp. 161-162) **Correlation of DSC measurement results on benzene monocyclic derivative with its chemical structure.** Fujimoto, Y. (Research Institute of Industrial Safety, Tokyo (Japan)); Ando, T.; Morisaki, S. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

With an objective to develop a method to predict energy hazards using chemical structure, an analysis was made on relationship of DSC measurement results on benzene monocyclic derivative with its chemical structure, especially with a heat generation starting temperature. A model to predict the heat generation starting temperature was discussed using the association and dissociation energy as a parameter. The dissociation energy index (DEI) was assumed to be 1/[association and dissociation energy (Kcal/mol)] $\times$ (10000). This indicates that the larger the figure, the association and dissociation energy is smaller, and the structure can be destroyed more easily, that is, more dangerous. A functional group index (FGI) was also made for correction. In an attempt to make predictions utilizing fuzzy inference methods, the DEI and the FGI were divided respectively into a large group (L) indicating a large hazard, and a small group (S) indicating a small hazard. An index referred to as TI was developed as an inverse number for the heat generation starting temperature, which was divided into three groups of S, M, and L. An inference was made using an inference rule to compare the predictions with the measurements. 1 tab.

24516 (CONF-921275–, pp. 113-116) **Characteristics of aluminum alloy in methane gas ignition by impact friction spark.: Ignition suppressing effect with surface preparation.** Komai, T. (National Institute for Resources and Environment, Tsukuba (Japan)); Uchida, S.; Shikada, N.; Tanaka, M. Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Impact friction spark generated between a light alloy and a carbon steel has high risk of igniting and exploding combustible gases including methane. The present study carried out experiments on

spark generation when aluminum alloys were given a metal spraying surface preparation (Metallikon) and on the ignition suppression effect of the treatment. Ordinary paints were also experimented for comparison. Two kinds of aluminum alloys were used, namely duralmin A2017 and Al-Zn-Mg-based A7075. Two kinds of metals, copper and stainless steel, were used for sprayed films, and the paints used were anticorrosion primer paints and synthetic resin paints. The results of experiments using a drop impact testing device may be summarized as follows: A copper Metallikon treatment with thickness from 0.3 mm to 0.8 mm reduced the ignition factor down to 10% to 20%, proving a sufficient effect. Surface preparations using the paints exhibited smaller effects than the Metallikon, but can be expected of fair effects when painted so thick that no separation can occur. 1 fig., 3 tabs.

24517 (EGG-M–92417) **Design and calibration of pulsed vapor generators for TNT, RDX and PETN.** Davies, J.P.; Blackwood, L.G.; Davis, S.G.; Goodrich, L.D.; Larson, R.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1992]. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9209325–1: 4. International symposium on analysis and detection of explosives, Jerusalem (Israel), 7-10 Sep 1992). Order Number DE93010622. Source: OSTI; NTIS; GPO Dep.

Computer controlled explosive vapor generators for 2,4,6trinitrotoluene (TNT), cyclo-1,3,5-trimethylene-2,4,6-trinitramine (RDX) and pentaerythritol tetranitrate (PETN) were built and calibrated to support an Independent Validation and Verification (IV&V) facility for Explosive Detection Systems (EDS) for the Federal Aviation Administration (FAA) at the Idaho National Engineering Laboratory. The generators were constructed using pure explosive suspended on quartz beads which were then loaded into a stainless steel tube. The tube was coiled and placed into a temperature controlled chamber. A carrier gas (ultra-pure air) was passed through the coil to carry the explosive molecules. The generators are capable of delivering a pulse of varying explosive mass through the control of coil temperature, air flow rate, and pulse width. Preliminary calibrations have been completed in the picogram to nanogram range using an Ion Mobility Spectrometer (IMS) as the calibrating instrument. The explosive vapor generators will be used as quantitative vapor standards to establish the lower limit of detection for EDS systems at the IV&V.

24518 (LA–12455-MS) **Synthesis and characterization of 1,4-dinitroglycoluril (DINGU).** Sanchez, J.A.; Stinecipher, M.M.; Stretz, L.A. Los Alamos National Lab., NM (United States). Jun 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93014111. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The synthesis and properties of 1,4-dinitroglycoluril (DINGU) have been studied. Isomers formed during the DINGU synthesis reaction were identified. The synthesis reaction was scaled up and reaction conditions optimized to produce the maximum yield of DINGU. This study evaluated DINGU as an energy contributing material in cast and plastic-bonded explosive formulations. Plastic coating of DINGU into a plastic-bonded explosive using several binders was also investigated. Testing indicated that DINGU has lower than expected explosive performance both as a pure material and when formulated in a plastic-bonded explosive.

24519 (LA-SUB–93-150) **Characterization of metal-loaded plastics: [Final report].** Thadhani, N. (New Mexico Inst. of Mining and Technology, Socorro, NM (United States). Center for Explosives Technology Research). Los Alamos National Lab., NM (United States); New Mexico Inst. of Mining and Technology, Socorro, NM (United States). Center for Explosives Technology Research. [1993]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93011247. Source: OSTI; NTIS; GPO Dep.

The purpose of this effort was to establish a reliable technique for bulk modulus measurements of tungsten-filled plastics. Bulk modulus determination of elastic materials is difficult and no standard technique has yet been developed. This is especially true for metal- filled plastics. Currently, the means of determining bulk modulus for a heavily filled plastic is one of extrapolation, rather then direct measurement and the accuracy of such extrapolated values is open to question. Two techniques were chosen for this study. The MTS hydrostatic pressure method utilizes a hydrostatic pressure call in which pressures ranging from 30-60 MPa can be generated in conjunction with a standard MTS testing machine. Corresponding strains are measured by strain gages or with longitudinal or circumferential extensometers. The ultrasonic velocity measurement method results in the direct measurement of pulse velocities of compression and/or shear waves in the material under strain. The bulk modulus is then calculated from the measured sonic velocities. This technique is an adaptation of an AISI technique for the measurement of elastic constants of isotropic materials. Equipment and hardware already exist at the New Mexico Institute of Mining Technology. CETR's principle investigator for this project. Dr. Nareesh Thadhani arranged for the use of the equipment once test specimens were prepared by Los Alamos and shipped to CETR. This arrangement was made in collaboration with Drs. Kalman Orevocz and Catherine Aimone from the Department of Mining Engineering. The task was separated into two phases. Phase 1 included a preliminary effort at test specimen fabrication and testing with each technique. Phase 2 included review of the Phase I results and selection of the best technique.

24520 (LA-SUB–93-184) **Computer modeling program for fragment trajectories within a bomb stack: Final report.** Pratt, D.A. (Morton Thikol, Inc., Brigham City, UT (United States). Utah Operations); Clark, D.P. Los Alamos National Lab., NM (United States); Morton Thikol, Inc., Brigham City, UT (United States). Utah Operations. 25 May 1989. 54p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93013916. Source: OSTI; NTIS; GPO Dep.

The large aerial bombs used by the Air Force are arranged in stack arrays within storage magazines. The effects of the inadvertent detonation of one bomb on other bombs in the stack or within the magazine are of critical importance and a means to prevent sympathetic detonation from occurring must be found if the integrity of the stored bombs is to be maintained. Los Alamos National Laboratory has been funded to explore the phenomena involved in the bomb stack and to evaluate systems to prevent the mutual detonation of adjacent bombs in the event of the detonation of a single bomb. A problem in addressing this project is the acceleration and deceleration of high velocity fragments emerging from the detonating bomb and the trajectories of these fragments through the bomb stack. Tests were conducted by the Air Force using a 3-row by 5-column bomb stack array. The array was fitted with a polymethylmethacrylate (PMMA) mitigation system consisting of blocks both between all adjacent bombs as well as in the center of each four-bomb rectangular array. The outside-upper corner bomb (1-1) was detonated (the donor). While bombs adjacent to the donor were protected from the effects of the blast by the PMMA mitigators, bombs sympathetically detonated were two rows and three columns away (3-4) and two rows and four columns away (3-5) from the donor. The purpose of this program was to perform numerical modeling of the physical processes involved in the flow of fragments within the bomb stack. The desired result was to predict the paths of the fragments and their impact velocities on any other bomb in the stack. In the modeling work covered by this report, the fragments are allowed to collide with stack elements, rebound from them, or travel unimpeded through the array. Elements of the bomb stack are acted on by gravity and drag forces as well as blast winds generated from the detonating explosive.

24521 (LA-UR–93-1119) **Temperature effects on failure thickness and deflagration-to-detonation transition in PBX 9502 and TATB.** Asay, B.W.; McAfee, J.B. Los Alamos National Lab., NM (United States). [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930713–6: 10. detonation symposium, Boston, MA (United States), 12-16 Jul 1993). Order Number DE93010742. Source: OSTI; NTIS; GPO Dep.

The deflagration-to-detonation (DDT) behavior of TATB has been investigated at high temperatures and severe confinement. comparison is made to other common explosives under similar confinement. TATB did not DDT under these conditions. The failure

thickness of PBX 9502 at 250°C has also been determined. Two mm appears to be the limiting value at this temperature.

24522 (LA-UR–93-1180) **Jet initiation thresholds of nitromethane.** Asay, B.W.; Pauley, D.J.; Ferm, E.N. Los Alamos National Lab., NM (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930713–9: 10. detonation symposium, Boston, MA (United States), 12-16 Jul 1993). Order Number DE93012627. Source: OSTI; NTIS; GPO Dep.

The initiation criterion for nitromethane and diethylenetriamine-sensitized solutions has been established over a confined range of jet diameters, velocities, and failure diameters. The data were normalized with the failure diameter that was chemically modified, and they support the hypothesis that the failure diameter should be made part of the critical initiation function. The difference between physically- and chemically sensitized NM in promptness of initiation, as measured by corner turning distance, was not statistically significant. The diameter of the Viper jet has been characterized over a wide range of velocities.

24523 (LA-UR–93-1557) **A study of the role of homogeneous process in heterogeneous high explosives.** Tang, P.K. Los Alamos National Lab., NM (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930713–10: 10. detonation symposium, Boston, MA (United States), 12-16 Jul 1993). Order Number DE93012733. Source: OSTI; NTIS; GPO Dep.

In a new hydrodynamic formulation of shock-induced chemical reaction, we can show formally that the presence of certain homogenous reaction characteristics is becoming more evident as shock pressure increase even in heterogeneous high explosives. The homogeneous reaction pathway includes nonequilibrium excitation and deactivation stages prior to chemical reaction. The excitation process leads to an intermediate state at higher energy level than the equilibrium state, and as a result, the effective activation energy appears to be lower than the value based on thermal experiments. As the pressure goes up higher, the homogeneous reaction can even surpass the heterogeneous process and becomes the dominant mechanism.

24524 (ORNL/TM–12274) **Thermal response of gator system internal components.** Moyers, J.C.; Childs, K.W.; Stovall, T.K. Oak Ridge National Lab., TN (United States). 15 Apr 1993. 35p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012996. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Gator Weapon System may be subjected to severe temperature extremes. One internal component of this system is known to be sensitive to very low temperatures. An analysis of the system was therefore made to determine the relationship between the environmental temperatures and the Gator's internal temperature profile. These internal temperature projections can then be used to define the external conditions under which the system would be prone to failure. Three detailed computer models and one simplified model were used to explore the thermal response of the Gator to a step environmental temperature change. The response to this nondimensionalized step change can then be used to predict the internal Gator temperatures for a variety of mission profiles. The study was also therefore able to determine if there was a possibility that the Gator would encounter the necessary external conditions required to bring about the cold temperature failure scenario. The results show the Gator mines to be well protected with a relatively slow thermal response. For example, given an initial temperature of (15.6°60°F) and a recovery temperature of −40°C (40°F) [this recovery temperature is the result of a speed of Mach 0.77, recovery factor of 0.89, and ambient temperature of −62.2°C (−80°F)], the critical component temperature drops to the limiting value of −31.7°C (−25°F) only after exposure times greater than 12 hours.

24525 (SAND–93-0757C) **Calibration of the BKW–EOS and application to aluminized composite explosives.** Hobbs, M.L.; Baer, M.R. Sandia National Labs., Albuquerque, NM (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9306150–1: 5. international conference of the Groupe de Travail de Pyrotechnie, Strasbourg (France), Jun 1993). Order Number DE93011671. Source: OSTI; NTIS; INIS; GPO Dep.

The Becker-Kistiakowsky-Wilson equation of state (BKW-EOS) has been calibrated over a wide initial density range near C-J states using measured detonation properties from 62 explosives at III total initial densities. Values for the empirical BKW constants α, β, κ, and θ were 0.5, 0.298, 10.5, and 6620, respectively. Covolumes were assumed to be invariant. Model evaluation includes comparison to measurements from 91 explosives composed of combinations of Al, B, Ba, C, Ca, Cl, F, H, N, 0, P, Pb, and Si at 147 total initial densities. Adequate agreement between predictions and measurements were obtained with a few exceptions for nonideal explosives. However, detonation properties for the nonideal explosives can be predicted adequately by assuming partial equilibrium. The partial equilibrium assumption was applied to aluminized composites of RDX, HMX, TNETB, and TNT to predict detonation velocity and temperature.

24526 (SAND–93-1091C) **Violence-of-reaction experiments.** Fischer, S.H.; Benham, R.A. Sandia National Labs., Albuquerque, NM (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9305189–2: 1993 joint Army, Navy, NASA, Air Force (JANNAF) Propulsion Systems Hazards Subcommittee meeting, Ft. Lewis, WA (United States), 10-14 May 1993). Order Number DE93013758. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The measurement of the violence of reaction produced when an energetic material is subjected to a cookoff environment has been poorly quantified in most experiments and accidents. Calculations of critical temperature and time to cookoff calibrated to experiments are often in agreement with experimental observations. However, the violence of reaction is sometimes very sensitive to the static and dynamic confinement, condition of the material and thermal history. It is difficult to quantify and correlate with these parameters due to the long heatup phase and rugged temperature requirements. Strong confinement is important since changes in the free volume and degree of venting are controlling parameters, but such confinement makes internal diagnostics of the state and chemistry of the sample very difficult. Intrusive diagnostics can also interfere in mass and energy transport processes in the sample. The authors have developed a one-dimensional cookoff-confinement experiment that automatically controls the thermal history while massive lateral confinement allows quantification of the violence of reaction through pressure, strain, and piston-velocity measurements. Up to 20 grams of energetic material is heated until a piston assembly fractures and the piston is driven up the barrel of the fixture. The quasistatic and dynamic pressure produced by the sample are measured with pressure transducers. They also measure the strain on the fracture web of the piston assembly. When the piston assembly fractures, the velocity of the portion traveling up the barrel is measured with VISAR (velocity interferometric system for any reflector). The pressure, strain, and velocity measurements are related and characterize the violence of reaction. Since the method for conducting these experiments has been developed, further testing with this hardware is on hold until coupled thermal, structural, and chemical computer codes are available.

24527 (UCRL-ID–112425) **Fabry Perot velocimetry on detonating LX-17 in planar and spherically divergent geometries.** Bahl, K.L.; Breithaupt, R.D.; Tarver, C.M.; Von Holle, W.G. Lawrence Livermore National Lab., CA (United States). Dec 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93013785. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Fabry Perot velocimetry and hydrodynamic calculations are used to quantitatively, determine the strengths of planar and spherically divergent detonation waves in LX-17 as functions of initial temperature, booster explosive and propagation direction. Cold LX-17 is shown to initiate more slowly than ambient temperature LX-17 but to eventually attain an equivalent detonation wave structure. LX-10 (HMX) boosters provide a greater initial momentum than do ultrafine TATB boosters, but the resulting LX-17 detonation waves are equivalent within 20 mm of propagation. No direction dependence

is observed between 0° and 60° from the pole. Comparison of these experimental velocity histories to CJ and ignition and growth ZND reactive flow calculations demonstrate that well defined LX-17 reaction zones with pressures well above Chapman-Jouguet (CJ) values are developed within one reaction zone length of propagation. After 20 to 30 mm of propagation, the LX-17 detonation waves approach steady state and the experimental records agree closely with the reactive flow calculations, CJ calculations are 4–5% low in velocity.

24528 (UCRL-ID–112431) **Performance properties of the emulsion explosive QM-100.** Garza, R.; Helm, F.; Souers, P.C.; Simpson, R.L. Lawrence Livermore National Lab., CA (United States). Dec 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93013786. Source: OSTI; NTIS; GPO Dep.

QM-100 was evaluated in cylinder expansion configuration to determine the detonation production equation of state. Two experiments were run. No differences in scaled cylinder wall expansions could be determined; hence, despite a diameter effect on detonation velocity, metal acceleration was the same for both experiments. Max expansion volumes were limited, $\sim 4\ V/V_o$. This was interpreted to be result of significant inhomogeneities in the emulsion explosive fills which in turn produced a nonuniform detonation and ruptured the cylinders. 7 refs., 6 figs., 4 tabs.

Saturations in excess of 100% are commonly calculated from measured grain density, bulk density and water content in clinoptilolite - bearing volcanic rocks. Clinoptilolite affects the property measurements in two ways. First the clinoptilolite produces inaccurate grain density measurements by interacting with the water or gas in the pycnometer. Second the protons in the non-pore water within the clinoptilolite structure are measured by the epithermal neutron tool and assumed to be part of the pore water in the calculation of saturation, frequently resulting in excessive saturations. Proton wideline pulsed Nuclear Magnetic Resonance (NMR) was used to measure all proton species contained within the rock samples. The Fourier transformed spectra were integrated and compared with an NBS standard of benzoic acid to yield grams of protons per gram of sample. Bound and free (mobile) water in rocks are distinguished by the NMR linewidth. Therefore we are able to distinguish and measure the non-pore water in the sample. Fifty samples from U4av were run to determine the applicability of the procedure. The amount of bound zeolitic water in the as-received samples ranged from 0.3 to 8.9 wt%. The neutron log was corrected for non-pore water and saturation was recalculated using free water only. Saturation was substantially reduced. To test the sensitivity of the samples to sample handling procedures ten samples were split and the splits subjected to different humidities, and then placed over a desiccant for 48 hours. Desiccating tended to eliminate the effects of prior sample treatment.

24530 (CONF-9109114–Vol.1, pp. 16-23) **A comparison of energy-window and spectral-fitting methods for the estimation of carbonate content in rocks using neutron-induced gamma rays.** Hearst, J.R. (Lawrence Livermore National Lab., CA (US)); Conaway, J.G.; Trcka, D.E.; Grau, J.A. Lawrence Livermore National Lab., CA (United States). [1991]. DOE Contract W-7405-ENG-48. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

When a nuclear explosive is tested underground, rock close to the explosion is heated to very high temperatures. If any of that rock contains carbonates, these are dissociated and the carbon may combine with oxygen to form carbon dioxide. When the rock cools, the carbon dioxide remains gaseous, possibly causing subsurface pressures greater than atmospheric, which could increase the hazard of a delayed leak. To reduce that possibility, formations that might contain significant amounts of carbonates are analyzed for those materials. We have compared measurements of carbonate content from two commercial neutron-induced gamma-ray spectroscopy logging systems in emplacement boreholes at the Nevada Test Site (NTS). Both systems use high-energy neutrons to excite carbon and oxygen nuclei inelastically, and a spectrometer to detect the resulting gamma rays. One system uses broad energy windows around the main carbon and oxygen gamma-ray peaks and relates the carbonate content to the ratio of the two window count rates. This ratio requires correction for the gap between the sonde and the borehole wall, which is measured mechanically, and for the formation water content, which is obtained from a neutron log. The other system determines carbonate content by fitting the entire energy spectrum to a set of standard spectra reflecting the system response to pure elements in the formation. Water corrections are obtained directly from the spectroscopic measurements; no gap correction is needed. We tested both systems in a calibration facility to determine their responses to different values of carbonate, gap, and water content. They were then run in two boreholes at the NTS. Cuttings samples from both holes were analyzed for carbonate content for comparison with log results. After suitable averaging of both sample and log data, the two spectroscopy systems agreed with the sample carbonate contents to about 0.003 weight fraction carbon.

24531 (CONF-9109114–Vol.1, pp. 24-33) **An on-site system for scanning NTS boreholes for artificial gamma-emitting nuclides.** Conaway, J.G. (Los Alamos National Lab., NM (US)). Lawrence Livermore National Lab., CA (United States). [1991]. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

The standard spectral gamma ray logging system used at the Nevada Test Site contains a large sodium iodide detector which provides high efficiency but low energy resolution. To enhance the capabilities of this system for identifying artificial gamma-emitting nuclides, I developed and implemented a simple procedure for extracting artificial components from low-resolution gamma-ray spectra. This procedure uses three basis spectra, developed by a consultant using numerical modeling, representing the spectral response of the downhole instrument to gamma radiation from naturally occurring potassium and gamma-emitting nuclides of the uranium and thorium families in a large-diameter airfilled borehole. To extract the artificial spectral components, the three basis spectra are first scaled to the recorded field spectrum using the usual spectral windows for K, U and Th; these windows bracket the photopeaks at 1.46, 1.76 and 2.61 MeV, respectively. Since most of the contribution from artificial nuclides will fail below 1.26 MeV (the lower limit of the potassium window) this scaling process should be insensitive to the presence of artificial nuclides. The scaled basis spectra are then subtracted from the field data, leaving a residual spectrum consisting of noise plus the contribution of any artificial gamma-emitting nuclides. This process is repeated for each spectrum in the log, or the spectra can be accumulated over any desired depth range for better statistics. Rather than inspect each spectrum visually, a parameter can be computed which indicates the presence of artificial nuclides; this parameter can be plotted along with the usual K, U and Th concentration estimates as a function of depth. These techniques have been used successfully on field data and provide us with an inexpensive screening tool to detect artificial nuclides along boreholes.

24532 (CONF-9109114–Vol.1, pp. 34-59) **Application of linear inverse theory to borehole gravity data.** Burkhard, N.R. (Lawrence Livermore National Lab., CA (US)). Lawrence Livermore National Lab., CA (United States). [1991]. DOE Contract W-7405-ENG-48. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

Traditional borehole gravity interpretations are based upon an earth model which assumes horizontal, laterally infinite, uniformly thick, and constant density layers. The traditional equation used to determine density is: $\rho=1/4\pi G(F-\Delta g/\Delta z)$ where ρ is the density of a layer, F is the free-air gradient, G is the gravitational constant, and Δg is the difference in measured gravity between borehole measurement stations separated by a depth difference ΔZ. Interpretation of borehole gravity data using this equation requires that the free-air gradient be known. This approach, however does not utilize any of the advances that modern generalized linear inverse theory can bring to the problem.

24533 (CONF-9109114–Vol.1, pp. 60-97) **Formation elastic parameters from acoustic and density logs in emplacement holes.** Mathews, M.A.; Fenster, R. Lawrence Livermore National Lab., CA (United States). [1991]. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

A new acoustic tool for dry emplacement holes has been built and tested in several emplacement holes. This tool uses a large hammer source and 3 piezoelectric transducers that are independently pressed against the borehole wall. The detectors are 6, 9 and 12 ft from the hammer source. A pure gel is injected between these detectors and the borehole wall to eliminate any air space. The compressional wave travel time and the shear wave travel time are recorded at each detector. The compressional wave velocity (Vp) and the shear wave velocity (Vs) are calculated from the travel time differences between the 3 detectors and their separations of 3 and 6 ft. These velocity values along with the bulk density obtrained from the density log are used to calculate the Elastic Constants of Young's Modules, Bulk Modules, Shear Modules an Poisson's Ratio. These mechanical rock properties are presently used in phenomenological analysis and seismic verification assessment. The VD velocities obtained from the acoustic logs in U19ba and U3mt compared reasonably well with the geophone survey velocities from these emplacement holes. The only major differences occurred in the fracture intervals of U19ba where the fracture intervals were identified with the borehole camera. The geophone velocities were much less than the acoustic velocities in these fractured intervals.

24534 (CONF-9109114–Vol.1, pp. 101-115) **A new three-dimensional radiation-hydrodynamics code.** Dismukes, C.; Higginbotham, M.; Johnson, W.; Reed, L.; Shkoller, B. Lawrence Livermore National Lab., CA (United States). [1991]. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

All Defense Nuclear Agency horizontal line-of-sight (LOS) events include mechanical LOS closures to help isolate recoverable experiments and recording instruments from radioactive cavity gas. Plasma and debris jetted in the LOS ground shock closure process can severely degrade the operational effectiveness of these closures. To slow the jetted material, other mechanical items such as HE machines, mufflers, and internal helical liners are placed closer to the device to disrupt the jetted LOS flow. Some of these are known to reduce jetting but may have undesirable effects on cavity growth along the tunnel or on formation of a normal stemming plug. An attractive technique to reduce or eliminate the source of jetting LOS flow is to generate an asymmetrical closure by placing various materials in, around, and along the pipe. However, containment scientists have been reluctant to use asymmetrical configurations in part because computer simulations cannot realistically model such geometries. A numerical model has been developed to investigate the effects of asymmetries on LOS flows. A reasonable approximation of helical LOS liners is also possible. The new code, RZTSOIL, extends the two-dimensional, multi-material, axisymmetric Eulerian code, 2DSOIL, by resolving a third rotational dimension about the cylindrical axis. This three-dimensional cylindrical model is especially well suited to investigate LOS geometries because they are inherently cylindrical and the highest zonal resolution naturally occurs in the most interesting and important regions, i.e., near the LOS. RZTSOIL retains all the 2DSOIL features, including radiation diffusion, multi-material hydrodynamics, and an elastic, perfectly plastic strength model. Validating comparisons of RZTSOIL results with one- and two-dimensional calculations for simple and complex geometries are shown. Also, an initial RZTSOIL calculation of a simple asymmetric LOS closure is presented to illustrate the modeling potential.

24535 (CONF-9109114–Vol.1, pp. 116) **DISKO ELM box A environment calculations.** Dismukes, C.R. (S-Cubed, La Jolla, CA (US)); Reed, L.L.; Keller, D.J. Lawrence Livermore National Lab., CA (United States). [1991]. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

Over 20 calculations were performed to arrive at the most accurate representation of the experimental conditions involved in the hot-spot measurements at the DISCO.ELM test. The calculated radiation arrival times and pulse shapes matched closely the experimental data obtained at LANL.

24536 (CONF-9109114–Vol.1, pp. 119-140) **DISKO ELM pipe flow calculations.** Reed, L.; Keller, D.; Pierce, T.; Higginbotham, M.; Sandmann, R. Lawrence Livermore National Lab., CA (United States). [1991]. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. S-Cubed has recently developed a turbulence-ablation algorithm to improve the fidelity of modeling pipe flow in LOS design calculations. It uses the combined effect of the coefficient of friction, wall enthalpy and flow velocity to ablate the pipe wall, adding mass to the plasma and decreasing its velocity thus delaying the signal propagation along the LOS pipe. This paper describes a calculation of DISKO ELM. The calculated propagation of the pressure front along the LOS pipe is in close agreement with that inferred from the on-pipe SLIFER data. A feature of this model that may prove quite useful is that the ablation can be locally increased to simulate helix effects. In the DISKO ELM calculation, we found that increasing the coefficient of friction in the region of the "stealth helix" decreased the velocity of the pressure front in a manner qualitatively similar to that indicated on the SLIFER record. This result hints that helix effects, which have proven elusive in modeling, may be simulated as enhanced ablation. A natural consequence of "slowing" the LOS plasma flow is to increase the energy coupling from the LOS flow into the surrounding stemming. Thus, ablation may have an important role in plug formation and containment.

24537 (CONF-9109114–Vol.1, pp. 141-159) **A two-dimensional turbulence-ablation model to simulate the helix in PINEX LOS pipes.** Keller, D.; Pierce, T.; Reed, L.; Koehler, H. Lawrence Livermore National Lab., CA (United States). [1991]. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

Helices have become a common pipestring design element on PInhole Neutron EXperiments (PINEX). Despite their recognized ability to reduce pipe flow, the mechanism of their effect is not rigorously understood, although not from lack of effort. In fact, Physics International undertook an extensive HE experiment program to investigate the process, and, more recently, S-Cubed performed a related pipe flow test series. All of these experiments corroborate

the fact that pressures are greatly reduced, yet the mechanism remains elusive. In part for this reason, no credible numerical helix model has been used in LOS design calculations. The need for such a model cannot be disputed as long as these design calculations are relied upon for anticipated test behavior when helices are used. S-Cubed recently undertook an IR&D program to develop an algorithm that produces the quantitative effects of a helix according to a qualitative model. The basis of the model is the assumption that ablation is dramatically enhanced by the interaction of the pipe wall and the plasma. In effect, the helix increases the "roughness" of the pipe. The increased roughness increases the ablation of the pipe wall, which adds mass to the plasma, decreasing its velocity and increasing its pressure. The ablation rate is controlled by the model parameters coefficient of friction and wall enthalpy, and by flow velocity. The code was calibrated by comparing calculated velocity and pressure with CORRTEX data from a LANL test that featured a helix. This paper reviews our model validation calculations, demonstrating the ability of the new ablation model to simulate helix flow attenuation in a recent LLNL PINEX experiment.

24538 (CONF-9109114–Vol.1, pp. 160-195) **Plasma flow in non-circular and asymmetric pipes.** Groethe, M. (S-Cubed, La Jolla, CA (US)); Reed, L.; Keller, D.; Olsen, C. Lawrence Livermore National Lab., CA (United States). [1991]. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

S-Cubed supported LLNL in the investigation of plasma flow in LOS pipes of various non-standard geometries. Novel approaches were sought to achieve both experiment and containment objectives in a conceptual high-yield vertical LOS test. Part of our program was a series of scaled HE pipe flow experiments, which are the subject of this paper. Flow diagnostics from the experiments confirmed our hypothesis that a "low-flow" pipe could be designed by increasing its asymmetry. In all, five pipe flow experiments were performed. Each was driven with a standard five-pound HE charge that was designed to implode symmetrically, crushing the LOS pipe. The cross-sectional area and thickness of the pipes were impulse-scaled to nuclear LOS pipe areas. The following pipe definitions were tested: (1) circular, as a baseline or standard; (2) oval, as a test of axial asymmetry; (3) rectangular, as an approximation of collapsing plates; (4) rectangular, with opposite walls of differing thickness as a test of mass-asymmetric collapsing plates; (5) rectangular, with opposite walls of differing thickness and stagnation strips, to provide asymmetry and disrupt the laminar flow. In all cases, the measured flow comprised two phases or pulses. Generally, first-pulse flow velocities were found to be sensitive to vacuum conditions inside the pipe, while the second-pulse showed greater geometry sensitivity. The effects of geometry were dramatic: Stagnation pressures associated with the second-pulse were reduced by a factor of 45 from most to least symmetric flow region.

24539 (CONF-9109114–Vol.1, pp. 199-207) **Effective stress model for rocks.** Dey, T.N. (Los Alamos National Lab., NM (US)). Lawrence Livermore National Lab., CA (United States). [1991]. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

An effective stress model, which has been implemented into a finite difference code suitable for containment calculations, is described. The model captures the well understood effects of pore pressure on shear strength and pore crushing. The model also incorporates work hardening and softening and a number of flow rules. Two examples illustrate some of the consequences of the effective stress model, including a decrease in shear strength during unloading, and liquefaction.

24540 (CONF-9109114–Vol.1, pp. 208-225) **Sensitivities of calculated residual stress to separation distances of two simultaneous events.** Rambo, J.T. (Lawrence Livermore National Lab. CA (US)); Moss, W.C. Lawrence Livermore National Lab., CA (United States). [1991]. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

LLNL has developed calculational capabilities to model simultaneous explosions of different yields with DYNA2D. Past experimental experience suggests that double events are contained when the work points are separated by no less than twice the sum of the final radii of the two cavities with the higher yield device buried at a safe depth and above the lower yield device. In the past, this non-optimal use of the drill hole was chosen to ensure safe containment and to provide cost savings. Although additional savings can be realized by placing the lower yield device above the higher yield device, there is no really relevant experimental experience. Given current and projected funding levels for the nuclear testing program, study (calculationally) of the feasibility of a low-overhigh emplacement could make possible significant savings. In this study we examine the sensitivity of the residual stress field to work point separation for a one kiloton device placed above a ten kiloton device. The geometry is cylindrically symmetric. Work point separations were varied between 50 and 300 m. The depth of burial for the upper device was fixed at 270 m so that overburden would not be a sensitivity factor in the residual stress calculation.

24541 (CONF-9109114–Vol.1, pp. 229-253) **Containment phenomenology using a new shear-strain-based computational damage model for TUFF.** Rimer, N. (S-Cubed, La Jolla, CA (US)); Proffer, W. Lawrence Livermore National Lab., CA (United States). [1991]. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

This paper presents the results of a series of spherically symmetric free-field ground motion calculations made using a new constitutive model for the damage assumed to occur in zeolitized tuff as a result of a nuclear explosion. The major difference in this damage model is that the transition between the "virgin" failure surface and the lower "damaged" strength after shock passage is based now upon the maximum shear strain recorded in the tuff element during the calculation rather than upon the peak volumetric strain used in older damage models. For the new model, the damaged strengths are obtained from the results of laboratory material properties tests on core samples of tuff which have been removed from near the cavity produced by the nuclear event. These tests show much lower strengths at confining pressures on the order of one kilobar than are shown in the standard "laboratory damage" tests in which virgin core samples are damaged using a uniaxial strain loading to a peak stress of 4 kb followed by a biaxial strain unload. Use of the new damage model did not change the calculated peak stresses, peak particle velocities, and cavity size which are in agreement with the usual ground motion measurements. Thus, the phenomenology and the constitutive models are not sufficiently constrained by the types of laboratory damage measurements presently being made. In the absence of experimental confirmation of the magnitude of the residual stress fields around a nuclear cavity, better material properties data are clearly needed to constrain these constitutive models that are used to calculate the grout stemming motions in horizontal line-of-sight (HLOS) events.

24542 (CONF-9109114–Vol.1, pp. 254) **Calculations of ground motion on Pahute Mesa.** App, F.N. (Los Alamos National Lab., NM (US)); Brunish, W.M. Lawrence Livermore National Lab., CA (United States). [1991]. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

The ground motion in the overburden sections of dense tuffs and lavas was studied by calculation. It was indicated that the dense layers are significantly more compressible and prone to shear failure than implied by tests on the core; this might be due to fractures in the hard rocks on Palute Mesa. It is believed that the gauges reflect accurately the motion of the rock mass.

24543 (CONF-9109114–Vol.1, pp. 257-274) **Thermodynamic evolution of nuclear cavities.** Peterson, E. (S-Cubed, La Jolla,

CA (US)); Lie, K.; Rimer, N.; Nilson, R.; Higgins, G. Lawrence Livermore National Lab., CA (United States). [1991]. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

The cavity pressure history of an underground nuclear explosion is of critical importance in nearly all aspects of containment phenomenology and engineering. During the dynamic ground motion phase of an event, the variation of pressure with cavity volume is important in determining the fraction of the device energy which is coupled to the ground and, ultimately, the final volume and associated equilibrium pressure of the cavity. At later times, the cavity pressure gradually decreases as the energy is radiated from the cavity gas to the cooler rock walls, causing ablation of wall material and heat loss to the surroundings. Throughout both of these periods, early and late, the cavity pressure is the primary force which drives the gas leakage that we seek to contain. The thermodynamic evolution of the cavity is strongly influenced by the amount of material which is mixed into the cavity by (1) early-time stress release subsequent to shock loading and (2) late-time thermal ablation of wall material. Through post-processing of ground motion calculations under different suppositions concerning thermal equilibrium within the cavity, it is estimated that although thermally-induced mixing might eventually envelop as much as 2700 Mg/kt, early-time stress unloading should release no more than 500 Mg/kt into the cavity. To explore the effect of early-time material mixing on quantities of containment interest, ground motion calculations are executed with a gradual release of mass into the cavity on a time scale consistent with shock loading and unloading of the added material. The results indicate that the time and amount of mixing has an important influence on the late-time cavity pressure, even though the effect on ground motion is nearly undetectable. Additional parameter studies illustrate the variations in cavity pressure and ground motion caused by variations in rock strength, water content, air void, and equation of state.

24544 (CONF-9109114–Vol.1, pp. 275-290) **Cavity pressure measurements on DISKO ELM.** Hudson, B.; Stubbs, T. Lawrence Livermore National Lab., CA (United States). [1991]. DOE Contract W-7405-ENG-48. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

Cavity pressure measurements were made on the DISKO ELM event using six stainless steel, pressurized, capillary tubes extending from the working point region to an alcove in the by-pass drift. Each pressure measurement system included two pressure transducers in the alcove and one in the stemming on the working point side of three check valves. Three water-filled tubes were pressurized to about 5000 psia before zero time with the full nitrogen-filled volume of the pressure tank. Two water-filled tubes were pressurized before zero time with essentially zero driving gas volume. The sixth tube was nitrogen-filled. The purpose of these measurements was to gain some knowledge concerning the performance of various measurement configurations as well as to obtain a cavity pressure history for DISKO ELM. Sixteen of the 18 pressure transducers appear to have given good data. The tubes that remained liquid-filled came into equilibrium with the cavity pressure first (about one minute). Data from the air-filled tube suggest blockage until collapse at about 2 h. The pressure transducers on the working point side of the check valves appear to be the most representative of cavity pressure. Four tubes (12 pressure transducers) gave very similar results from about 3 min until collapse at about 28 h. A comparison of the data from Rhyolite, Cornucopia, and Mission Ghost supports the conclusion that the DISKO ELM data are representative of cavity pressure.

24545 (CONF-9109114–Vol.1, pp. 291-310) **Dalhart post shot investigation.** Mathews, M.A. (Los Alamos National Lab., NM (US)); Hahn, K.; Thompson, J.; Gadeken, L.; Madigan, W. Lawrence Livermore National Lab., CA (United States). [1991]. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

Multiple radioactive isotopes tracers are used in borehole operations in the petroleum industry and these tracers are monitored by gamma ray spectroscopy logging tools. The nuclear test DALHART, U4u, was executed at a depth of 2100 ft on October 13, 1988. This test has multiple radioactive isotopes or fission products associated with it and knowledge of the distribution of these isotopes is desirable for the Nuclear Test Program. A slant post shot hole was drilled in late August, 1990 to sample the geologic material from the collapsed zone or chimney above DALHART. This 9 7/8 inch borehole was drilled at approximately 19 degrees from the vertical toward the DALHART execution depth. This borehole started at approximately 734 ft due south of the DALHART event. Drilling was completed to 2280 ft (2156 ft TVD). The water level was encountered at a depth of 1741 ft (1644 ft TVD). A Halliburton 1 11/16 in diameter TracerScan gamma-ray-spectroscopy log was run inside the drill string at a speed of 10 ft/min. Spectra obtained from TD to the surface indicated that radioactive material produced by the test was present from TD to 1850 ft (1746 ft TVD). Spectra were acquired at 0.25 ft depth intervals and averages recorded digitally every ten ft and thirty ft were displayed on the blue line log together with the total observed gamma ray and casing collar locater signal. Eleven samples were acquired from the depth interval 2212 ft to 1823 ft (2089 to 1721 ft TVD). None of these samples contained enough activity to be measured with normal drillback survey instruments. An onsite intrinsic Ge detector showed that each sample contained ^{137}CS, ^{125}Sb and ^{106}Ru. The samples were sent to Los Alamos to determine the radionuclide content at each depth. These analyses were compared with the spectral data obtained from the spectroscopy log and radionuclide distribution was mapped.

24546 (CONF-9109114–Vol.1, pp. 311-315) **Cavity collapse safety system.** Deupree, R.G. (Los Alamos National Lab., NM (US)); Neergaard, J.R.; Turner, W.J. Lawrence Livermore National Lab., CA (United States). [1991]. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

The EXCOR time domain reflectometer has been used to determine cavity collapse properties on Los Alamos nuclear weapons tests for several years. We have now extended the system to provide warning for data recovery teams in the trailers that cavity collapse has begun to take place. This new approach is far more reliable than the previous practice of examining geophone traces.

24547 (CONF-9109114–Vol.1, pp. 319-358) **RAMS data for selected LANL events.** Trent, B.C. (Los Alamos National Lab., NM (US)); Marusak, N.L. Lawrence Livermore National Lab., CA (United States). [1991]. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

Data from downhole RAMS (remote area monitoring station) packages have been compiled for several LANL events. We are making this data easily available so that a more effective analysis can be made of the performance of LANL emplacement design. For each event, general information is available such as hole designator, number and location of RAMS packages fielded and other information such as cavity collapse time and some specific radiation history data. The actual curves plotted for a given event might include the low and/or high pressure record(s), the radiation time history and the measured acceleration, depending on the availability and readability of the RAMS unit. Although some components of these data have been presented elsewhere, the actual curves (especially the pressure records) have not been previously available.

24548 (CONF-9109114–Vol.1, pp. 359-375) **Field measurements of tracer gas transport induced by barometric pumping.** Nilson, R.H. (S-Cubed, La Jolla, CA (US)); Lagus, P.L.; McKinnis,

W.B.; Hearst, J.R.; Burkhard, N.R.; Smith, C.F. Lawrence Livermore National Lab., CA (United States). [1991]. DOE Contract W-7405-ENG-48. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

Vertical gas motions induced by barometric pressure variations can carry radioactive gases out of the rubblized region produced by an underground nuclear explosion, through the overburden rock, into the atmosphere. To better quantify the transit time and amount of transport, field experiments are being conducted at two sites on Pahute Mesa, and Kapelli Tierra, where radioactive gases have been earlier detected in surface cracks. At each site, two tracer gases are injected into the rubblized chimney 300-400 m beneath the surface and their arrival is monitored by concentration measurements in gas samples extracted from shallow collection holes and tented areas located near surface cracks. The first "active" tracer is driven by a large quantity of injected air, the second "passive" tracer is introduced with minimal gas drive to observe the natural transport by barometric pumping. Kapelli was injected over a year ago, whereas Tierra was injected just recently. At both Kapelli and Tierra, no surface arrival of tracer was observed during the active phase of the experiment despite the injection of several million cubic feet of air, suggesting that cavity pressurization is likely to induce horizontal transport along high permeability layers, rather than vertical transport to the surface. Soon thereafter, a quasisteady pumping regime was established, with tracer concentrations in effluent gases typically 1000 times smaller than concentrations thought to exist in the chimney. Comparison of this thousand-fold dilution with theoretical calculations indicates that the prominent surface crack at Kapelli is not, by itself, the primary breathing passage of the chimney, but rather that there are likely to be many more cracks, spaced several meters apart, having comparable transport but less obvious surface expression.

24549 (CONF-9109114–Vol.1, pp. 376-398) **Parametric studies of gas flow in LLNL and LANL stemming.** Trent, B.C. (Los Alamos National Lab., NM (US)). Lawrence Livermore National Lab., CA (United States). [1991]. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

Fairly high levels of radiation were detected relatively high in the hole for the LLNL Barnwell event at relatively early times. In an effort to understand the phenomenology of such transport, an extensive array of gas flow calculations was performed. After 21 calculations, reasonable agreement was achieved with the pressure and radiation records at all the elevations in terms of magnitude, shape of the curves and time-of-arrival. The results indicate that for this event, which is not typical of LLNL stemming performance, there was fairly high permeability (100 darcy) flow through (or around) the lower four SGC plugs, high permeability (10 to 20 darcy) in the upper formation (above 384 m), and a reasonably high cavity pressure (134 bars) with slow decay. These same boundary conditions and formation properties were used to drive gas through typical LANL stemming, i.e. alternating layers of coarse and fines. The results of those calculations indicated lower magnitudes and later arrivals of radiation and pressure, particularly for the case where the fines were assumed to have been compacted to a lower permeability within the 1 kbar stress region.

24550 (CONF-9109114–Vol.1, pp. 399-411) **Sustained growth of multiple gas-driven fractures.** Nilson, R.H. (S-Cubed, La Jolla, CA (US)); Halda, E.J.; Griffiths, S.K. Lawrence Livermore National Lab., CA (United States). [1991]. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

The long-range extension of a single hydrofracture is frequently considered as a possible threat to the containment of an underground nuclear test. However, the results of explosively driven field experiments, like Sandia's junior jade series, suggest that conditions strongly favoring hydrofracture are likely to produce several fractures of moderate length rather than a single one of excessive length. Improved understanding of multifracture phenomena should, therefore, lead to a more realistic assessment of the hydrofracture threat and perhaps a better understanding of fragmentation, energy dispersal, and material mixing. In particular, the present paper seeks to define the conditions necessary for sustained propagation of multiple fractures. Multiple fractures emanating from a common source compete with one another because an increase in the aperture of any one crack increases the compressive stress on its neighbors, reducing their apertures. Furthermore, since a larger aperture will generally increase the speed of driving gases, a wider crack will elongate faster than its counterparts, further increasing its aperture and speed at their expense. So a fracture which gains a slight advantage will rapidly squelch its neighbors whenever fracture growth rates are limited by frictional effects in the driving gasses. However, it should be possible to sustain the growth of multiple fractures if the driving gas pressure is great enough to drive them all at the so-called "terminal" speed which is controlled by inertial and/or micromechanical affects occurring within the rock. Similarly, it may also be sufficient that the driving pressure be large enough to sustain choked flow at the inlets to all of the cracks. Under either of these conditions, fracture speeds become less sensitive to aperture and length, thereby disabling the fracture-competition mechanism which would otherwise prevent the long-range extension of multiple fractures.

24551 (CONF-9109114–Vol.1, pp. 412-449) **Gas flow calculations and measurements for the Ledoux event.** Trent, B.C. (Los Alamos National Lab., NM (US)); Lowry, W.E. Lawrence Livermore National Lab., CA (United States). [1991]. From 6. symposium on containment of underground nuclear explosions; Reno, NV (United States); 24-26 Sep 1991. In *Sixth symposium on containment of underground nuclear explosions: Proceedings: Volume 1.* 491p. Order Number DE92041091. Source: OSTI; NTIS (US Sales Only).

In addition to the standard pressure and radiation measurements made in the stemming materials, gas pressure measurements were also made in the diagnostic drift (in communication with the zero room) and in specially drilled holes adjacent to the main drift. The results of these measurements ranged from excellent to very limited knowledge gained. The results are presented along with recommendations for improved design for future experiments. The purpose of making such measurements is to help validate porous flow calculations. Extensive pre-shot gas flow and radiation transport calculations were performed, and the results are compared to the actual data.

24552 (ORNL/Sub–91-SG105/1) **HEMP emergency planning and operating procedures for electric power systems: Power Systems Technology Program.** Reddoch, T.W. (Electrotek Concepts, Inc., Knoxville, TN (United States)); Markel, L.C. Oak Ridge National Lab., TN (United States); Electrotek Concepts, Inc., Knoxville, TN (United States). [1991]. 97p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012094. Source: OSTI; NTIS; GPO Dep.

Investigations of the impact of high-altitude electromagnetic pulse (HEMP) on electric power systems and electrical equipment have revealed that HEMP creates both misoperation and failures. These events result from both the early time E_1 (steep-front pulse) component and the late time E_3 (geomagnetic perturbations) component of HEMP. In this report a HEMP event is viewed in terms of its marginal impact over classical power system disturbances by considering the unique properties and consequences of HEMP. This report focuses on system-wide electrical component failures and their potential consequences from HEMP. In particular, the effectiveness of planning and operating procedures for electric systems is evaluated while under the influence of HEMP. This assessment relies on published data and characterizes utilities using the North American Electric Reliability Council's regions and guidelines to model electric power system planning and operations. Key issues addressed by the report include how electric power systems are affected by HEMP and what actions electric utilities can initiate to reduce the consequences of HEMP. The report also reviews the salient features of earlier HEMP studies and projects, examines

technology trends in the electric power industry which are affected by HEMP, characterizes the vulnerability of power systems to HEMP, and explores the capability of electric systems to recover from a HEMP event.

24553 (SAND–93-0368) **Estimation of partial decoupling of cavity events.** Garbin, H.D. Sandia National Labs., Albuquerque, NM (United States). Mar 1993. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012439. Source: OSTI; NTIS; GPO Dep.

One proven method of evading the detection of a nuclear test is to decouple the explosion with a large air-filled cavity. Past tests have shown it is possible to substantially reduce the seismic energy emanating from a nuclear explosion by as much as two, orders of magnitude. The problem is not whether it can be done; the problem is the expense involved in mining a large cavity to fully decouple any reasonable size test. It has been suggested that partial decoupling may exist so some fraction of decoupling may be attained between factors of 1 to 100. MISTY ECHO and MINERAL QUARRY are two nuclear tests which were instrumented to look at this concept. MISTY ECHO was a nuclear explosion conducted in an 11 m hemispherical cavity such that the walls were over driven and reacted in a non-linear manner. MINERAL QUARRY was a nearby tamped event that is used as a reference to compare with MISTY ECHO. The scaled cavity radius of MISTY ECHO was greater than $2m/kt^{1/3}$. Both of these tests had free-field accelerometers located within 400 m of their respective sources. Analysis of surface ground motion is inconclusive on the question of partial decoupling. This is due to the difference in medium properties that the ray paths take to the surface. The free-field configuration alleviates this concern. The analysis consists of cube-root signal MINERAL QUARRYs signal to MISTY ECHO's yield and calculating the ratio of the Fourier amplitudes of both the acceleration and the reduced displacement potentials. The results do not indicate the presence of partial decoupling. In fact, there is a coupling enhancement factor of 2.

24554 (SAND–93-0738) **Defense Programs: A Sandia weapon review bulletin, Winter 1993.** Floyd, H.L.; Goetsch, B.; Doran, L. (eds.). Sandia National Labs., Albuquerque, NM (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013496. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This bulletin describes current efforts at Sandia National Laboratory to assist the US DOE defense programs. Topics in this issue include: compact electronic power circuits, stockpile stewardship, the SafeGuards transporter, laser diode ignition systems, an examination of the threat of nuclear weapon theft, and nuclear weapons testing.

24555 (UCRL-ID–112735) **A magnetically contained Mach three expansion.** Simonson, G.F.; Byers, J.A.; DiPeso, G.J.; Hewett, D.W.; Shumaker, D.E. Lawrence Livermore National Lab., CA (United States). Jan 1993. 82p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93013935. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The expansion of debris from a high altitude nuclear explosion (HANE) and its interaction with the geomagnetic field and ambient atmosphere have been calculated with a two-dimensional hybrid particle-in-cell (PIC) code. This work is distinct from the authors' previous simulations of detonations at very high altitude (VHANE) in that the surrounding air ion density is much increased and the air now plays a significant role in the dynamics of the expansion. The mean debris expansion velocity is 1,500 km/s, as in previous VHANE calculations, but the Alfven velocity in undisturbed air is now only 500 km/s, providing a Mach three expansion. The maximum distance over which weapon debris is dispersed, and the diamagnetic cavity radius, are considerably smaller than for a VHANE of like yield. The standard scaling of bubble radius with kinetic yield and field strength does not apply.

24556 (UCRL-JC–108751) **Fiber-optic cable replacement for NTS applications.** Sargis, P.D. Lawrence Livermore National Lab., CA (United States). Nov 1991. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920367–9: Department of Defense (DOD) fiber optics conference, McLean, VA (United States), 25 Mar 1992). Order Number DE93012548. Source: OSTI; NTIS; GPO Dep.

Coaxial cables are gradually beinq replaced by analog fiber-optic links at the Nevada Test Site. The capabilities of two recently developed systems will be discussed.

24557 (UCRL-JC–111562) **Interactions between shocks and turbulence: Large eddy simulations.** Buckingham, A.C. Lawrence Livermore National Lab., CA (United States). Nov 1992. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9211128–9: 1992 nuclear explosives code developers conference, Sunnyvale, CA (United States), 2-6 Nov 1992). Order Number DE93013352. Source: OSTI; NTIS; GPO Dep.

When a shock moves into and interacts with an existing turbulent field, a substantial enhancement of the after-shock turbulent intensity and a simultaneous distortion and realignment of the tensor strain rate field and associated tensor stress field results. Component mixing, random advective transport, and diffusion and associated momentum and energy dissipation are often substantially intensified over their preshocked levels. A combination of low preshocked turbulent intensity and strong shocks evidently produces the most pronounced change in the level of turbulent intensity. Combinations of high preshocked turbulent intensity and weaker shocks result in more modest changes to the turbulent field but much more pronounced dynamical distortion and erratic motion of the shock front itself during the interaction. Recent experimental observations suggest that substantial turbulent intensification and pronounced shock front distortion persists even for shocks propagating at Mach numbers in excess of 100. This discussion investigates the physics of the interaction process using numerical simulations to supplement and analyze the existing experimental data base. Use has been made of direct two dimensional Monte Carlo simulations to examine the influence of upstream turbulence on shock structure and front topography. Linear viscoelastic turbulence response parameters were developed in modeling the interaction. Compressible, two-dimensional large eddy simulations (LES) have been applied. Predicted amplification levels, modal energy partition, shock translational to turbulence kinetic energy transfer, and viscoelastic response of turbulence to shock interaction are examined in comparison with available experimental evidence. Developments in two-band dynamic eddy viscosity modeling for the subgrid scales are being implemented to improve results of the LES in the near wall region, under the influence of stochastic subgrid scale backscatter, and near the shock.

24558 (DNA-TR–92-131) **Validation of survivability validation protocols.** Stringer, T.A. (Kaman Sciences Corp., Colorado Springs, CO (United States)). Defense Nuclear Agency, Alexandria, VA (United States); Kaman Sciences Corp., Colorado Springs, CO (United States). May 1993. 18p. Sponsored by Department of Defense, Washington, DC (United States). Contract DNA 001-89-C-0080. Order Number DE93013096. Source: OSTI; NTIS.

Issues associated with the validation of survivability protocols are discussed. Both empirical and analytical approaches to protocol validation are included. The use of hybrid simulations (hardware-in-the-loop, scene generators, software generators, man-in-the-loop, etc.) for the validation of survivability protocols is discussed.

24559 (LA–12450-MS) **Comments on "global defense and strategic stability".** Canavan, G.H. Los Alamos National Lab., NM (United States). Apr 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93013594. Source: OSTI; NTIS; GPO Dep.

Recent Russian publications are used to explore disagreements over the stability characteristics of the regime we are leaving and the one we want to enter. Doing so gives a clear picture of how stability issues are quantified in current Russian thinking, what their main conclusions are, and how they serve as a guide to Former Soviet Republics thinking in moving towards this new world order. It demonstrates the convergence of exchange calculations and gives a prescription for connecting the results of US and Russian stability metrics, which could open the way for more fruitful discussions of the joint pursuit of offensive reductions and defenses.

24560 (LA–12489-MS) **Fast interceptors for theater boost-phase intercept.** Canavan, G.H. Los Alamos National Lab., NM (United States). Apr 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93013596. Source: OSTI; NTIS; GPO Dep.

Boost-phase theater intercept concepts are needed for known and existing countermeasures to current systems. Fast kinetic energy interceptors could be developed from existing and improved propulsion technology and miniaturized sensors to provide that capability. High velocity interceptors with achievable acceleration could achieve the ranges needed for protection of bases and populations, addressing most theater threats. Propulsion requires development. Drag and heating are largely predictable and controllable. Fast interceptors would also have useful applications in national and global missile defense.

24561 (UCRL-ID–109792) **Spacecraft Fabrication and Test MODIL: Quarterly report, December 1991–February 1992.** Saito, T.T.; Spellman, G.P.; Sanders, D.M.; Griffith, L.V.; Cruz, G.E. Lawrence Livermore National Lab., CA (United States). May 1992. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93012392. Source: OSTI; NTIS; GPO Dep.

MODILs (Manufacturing Operations and Development Integration Laboratories) wert established to mitigate the risk and cost escalation of producing SDI systems. The Spacecraft Fabrication and Test (SF&T) MODIL was first proposed by the Lawrence Livermore National Laboratory in February of 1991 and was initiated in late November 1991 with an initial funding of $2.0 M from the Department of Defense MANTECH program. The DoD focal point has been Mr. Greg Stottlemyer of SDI's Systems Integration and Command and Control office. The SF&T MODIL has been established to improve spacecraft producibility and create a spacecraft industry quantity production culture. We describe the background of MODILs, objectives and scope, current organization (including cooperating government agencies), and the current thrusts of Materials and Structures, Test and Assembly, Spacecraft Integration Technology, and Precision Technologies. We are preparing to participate in the Producible Technology Working Groups (PTWGs) being established by SDIO. The current plan is to initiate selected productivity demonstration projects with industry to show the benefits of the MODIL approach and prepare comprehensive plans for follow-up activities. Some major conclusions from this quarter are: The top producibility issues varied between SDIO contractors; Producibility issues must be re-prioritized based on changing mission requirements; and MODEL future success depends on addressing producibility issues that are important to SDIO Program offices. The whole-hearted concurrence of the contractor that will insert the production technology is required.

24562 (UCRL-JC–110271) **Spacecraft Fabrication and Test Manufacturing Operations and Development Integration Laboratory (MODIL): Establishing a spacecraft fabrication culture.** Saito, T.T. (Lawrence Livermore National Lab., CA (United States)); Sanders, D.M.; Stowers, I; Aswani, M. Lawrence Livermore National Lab., CA (United States). Apr 1992. 8p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920471–7: International Society for Photo Optical Engineering (SPIE) conference, Orlando, FL (United States), 20-24 Apr 1992). Order Number DE93012494. Source: OSTI; NTIS; GPO Dep.

MODILs (Manufacturing Operations and Development Integration Laboratory) were established to mitigate risk and cost escalation of producing SDI systems. The Spacecraft Fabrication and Test MODIL has been established to impact spacecraft producibility and create a spacecraft industry quantity production culture. We describe the background of MODILS, objectives and scope, current organization (including cooperating government agencies), and the current thrusts of Materials and Structures, Test and Assembly, Spacecraft Integration Technology, and Precision Technologies. The current plan is to initiate selected productivity demonstration projects with industry to show benefits of the MODIL approach and prepare comprehensive plans for follow-up activities.

24563 (UCRL-JC–110272) **Cryocooler producibility, within a MODIL concept.** Cruz, G.E. (Lawrence Livermore National Lab., CA (United States)); Saito, T.T.; Fehrenbacher, L. Lawrence Livermore National Lab., CA (United States). Apr 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9204112–4: 2. small satellite technology and applications, Orlando, FL (United States), 20-24 Apr 1992). Order Number DE93012493. Source: OSTI; NTIS; GPO Dep.

Cryocoolers are a key component for many spacecraft. We summarize some spacecraft cryocooler requirements and discuss our observations regarding the current production capabilities of cryocoolers. The MODILs interaction with industry, especially through the Producible Technology Working Groups is also summarized. The current Spacecraft Fabrication and Test MODIIL's plans to improve producibility include working closely with industry, executing a demonstration project, and holding a workshop to bring key members of the current cryocooler development network together.

4506 Chemical and Biological

24564 (UCRL-ID–111403) **Neutralization of chemical/biological ballistic warheads by low-yield nuclear interceptors.** Kruger, H.; Mendelsohn, E. Lawrence Livermore National Lab., CA (United States). 6 Aug 1992. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93012445. Source: OSTI; NTIS; GPO Dep.

We have investigated the capability of low-yield nuclear interceptors to neutralize chemical or biological tactical ballistic missile warheads using our TART coupled neutron-gamma Monte Carlo radiation transport code. In these calculations we used the neutron and gamma output spectra of a generic fission or fusion interceptor warhead and a generic chemical/biological warhead model. We made estimates of radiationneutralization criteria for biological organisms, biologically derived toxins, and chemical agents. We stipulated an interceptor miss distance of the order of one meter. Using these criteria, we find that a 100ton fission yield will neutralize the biological agent in all submunitions at an intercept distance of three meters. Neutralization of the chemical agent at this distance will require a fission yield of a few kilotons. This task can be accomplished with a fusion yield of only 100 tons. We would also expect 100 tons of either fission or fusion yield to neutralize unarmed or armed tactical ballistic missile nuclear warheads at a three meter miss distance by vaporization of fissile materials. Thus, we believe that a low-yield nuclear interceptor offers a defense capable of neutralizing tactical ballistic missiles carrying anyone of the three classes of mass-destruction warheads.

24565 (UCRL-ID–112014) **Neutron shielding of chemical/biological warheads to minimize the effects from low-yield nuclear interceptors.** Mendelsohn, E. Lawrence Livermore National Lab., CA (United States). Oct 1992. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93013101. Source: OSTI; NTIS (US Sales Only); GPO Dep.

We have previously reported results of Monte Carlo calculations in which we utilized the penetrating radiation from a small nuclear warhead to produce damaging energy deposition in chemical and biological warheads containing toxic agents. In the present work we have extended that study to include the effects of substantial neutron shielding on such energy deposition. This assumes that an attacker is willing to suffer a large payload penalty to assure the survival of a few submunitions elements. Our results show that there is a significant benefit from such a trade-off only for a fission source. For a fusion source the energy deposition in the shielded submunitions is approximately the same as in submunitions with the lowest energy deposition in the unshielded warhead.

24566 (Juel–2691) **Contributions to the environmental specimen bank. Pt. 8. Analysis of the concentration-time characteristics of selected sewage sludge constituents - derivation of a sampling strategy for representative sewage sludge specimens.** Osberghaus, U. (Analytisches Labor, Aachen (Germany)); Grimmer, G.; Stoeppler, M. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Chemie 4 - Angewandte Physikalische Chemie. Nov 1992. 184p. (In German). Order Number DE93792712. Source: OSTI; NTIS (US Sales Only).

Sewage sludge samples were taken from nine differently sized sewage treatment plants at monthly intervals. The samples were analyzed for dry residues, residues on ignition, 7 heavy metal components and 15 polycyclic aromatic hydrocarbons. Assuming a normal data distribution each concentration-time sequence was assigned a coefficient of variation for determination of the variance of distribution, and the sample size, which must be known for the purpose of representative sampling, was calculated for a statistical confidence level of 90%. (orig.).

Environmental Sciences Division Publication No. 4034.

This progress report summarizes the research and development activities conducted in the Environmental Sciences Division of Oak Ridge National Laboratory during fiscal year (FY) 1992, which which extended from October 1, 1991, through September 30, 1992. This report is structured to provide descriptions of current activities and accomplishments in each of the division's major organizational units. Section activities are described in the Earth and Atmospheric sciences, ecosystem studies, Environmental analysis, environmental biotechnology, and division operations.

Detailed examination and information was obtained on the Netherlands Energy Research Foundation designed Wet Annular Denuder that is used for the determination of ammonia, nitric acid and sulfur dioxide. We are now actively considering whether to borrow and or purchase an instrument for use in our field campaigns. If done it will be the first such instrument deployed in the US Highlights from the 4 German institutes visited include information on: sophisticated deployment of OH measuring capabilities involving lasers including laser induced fluorescence, long path UV, and differential optical absorption; tunable diode lasers utilized to measure a variety of substances; field investigations directed at elucidating cloud processes and reactions in ground based fogs; extensive use of spectroscopy to measure elemental and gaseous pollutants.

24569 (BNL–70309) **[The North Atlantic Regional Experiment (NARE)]: Foreign trip report, January 25, 1993–January 30, 1993.** Daum, P. Brookhaven National Lab., Upton, NY (United States). 22 Mar 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93010126. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A planning meeting for the North Atlantic Regional Experiment (NARE) summer 1993 field intensive was attended. The meeting was held at the University of East Anglia, Norwich, England from January 26–29, 1993. The meeting was organized by Stuart Penkett, and was attended by scientists from both North America and Europe. The summer intensive will be conducted during the month of August. Participating North American scientists will focus efforts on measurements along the northeastern coast of the US and in Nova Scotia. They will also support surface measurements in the Azores, Iceland, and in Bermuda. At least three instrumented aircraft will contribute to the North American effort. European activities will focus on the British Meteorological Office C-130 aircraft. The Europeans will also activate a number of existing sites to measure ozone concentration profiles. The coordination between measurements conducted on either side of the Atlantic will not be close because of the lack of meteorological data in the mid-Atlantic which would allow prediction of transoceanic transport.

24570 (CFS/OO–46-13/35-1991E, pp. 17-20) **The acid rain phenomenon.** Martin, H.C. (Atmospheric Environment Service, Environment Canada, Downsview, ON (Canada)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings*. 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

An overview is presented of the acid rain phenomenon, following the pollutants from their sources, through the atmosphere, to deposition and environmental responses. In the northern hemisphere, acidification is co-located with highly industrialized regions. Sulfur dioxide emitted into the atmosphere is deposited unoxidized in a dry form or is oxidized. It may react with water before or after oxidation to be deposited as a sulfate. Nitrogen oxides are similarly oxidized, however the process is complicated by photochemical effects. To measure surface deposition a network system is required. There are no long-standing networks for measuring dry deposition. Despite difficulty is assessing sensitivity, it is evident that regions at risk include upper New England and the eastern central portions of Ontario, Quebec and the Maritimes. The complexities of acid rain modelling are discussed. Aquatic responses to acidification include fish extinction, sphagnum moss invasion, and overall reduced diversity and populations of organisms.

24571 (CONF-920435–1) **Scale aggregation in semi-smooth flow.** Max-Planck-Institut fuer Meteorologie. Report. Claussen, M. Max-Planck-Institut fuer Meteorologie, Hamburg (Germany). Aug 1992. 23p. From 17. general assembly of the European Geophysical Society; Edinburgh (United Kingdom); 6-10 Apr 1992. Order Number DE93795283. Source: OSTI; NTIS (US Sales Only).

Recent work on vertical momentum, heat, and moisture transport over heterogeneous terrain has indicated that small areas of large roughness or obstacles dominate the regional momentum flux, whereas the regional heat and moisture fluxes are determined by the dominant surface cover. Therefore, it is hypothesized that regional momentum flux should be evaluated from an effective roughness length which implicitly accounts for the form drag of obstacles, whereas regional heat and moisture fluxes should be estimated from local surface parameters such as local roughness lengths. This hypothesis compares favorably with other proposals when testing it by using numerical simulations of regional surface fluxes in boudary-layer flow over homogeneous terrain with sparsely distributed roughness elements, i.e. in so-called semi-smooth flow. (orig.).

24572 (CONF-920791–, pp. 7, Paper 17) **Continuous emission monitor for incinerators.** Demirgian, J. (Argonne National Lab., IL (US)). USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring*

technologies. 261p. Order Number DE93005318. Source: OSTI; NTIS.

This paper describes the development of Fourier transform infrared (FTIR) spectroscopy to continuous monitoring of incinerator emissions. Fourier transform infrared spectroscopy is well suited to this application because it can identify and quantify selected target analytes in a complex mixture without first separating the components in the mixture. Currently, there is no on-stream method to determine the destruction of hazardous substances, such as benzene, or to continuously monitor for hazardous products of incomplete combustion (PICS) in incinerator exhaust emissions. This capability is especially important because of Federal regulations in the Clean Air Act of 1990, which requires the monitoring of air toxics (Title III), the Resource Conservation and Recovery Act (RCRA), and the Toxic Substances Control Act (TSCA). An on-stream continuous emission monitor (CEM) that can differentiate species in the ppm and ppb range and can calculate the destruction and removal efficiency (DRE) could be used to determine the safety and reliability of incinerators. This information can be used to address reasonable public concern about incinerator safety and aid in the permitting process.

24573 (CONF-920791–, pp. 6, Paper 31) **Characterization sites field analytical methods.** Guerin, M.R. (Oak Ridge National Lab., TN (US)); Wise, M.B. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

Direct Sampling Ion Trap Mass Spectrometry (DSITMS) has been under development in our laboratory for several years for the rapid determination of organics in environmental samples. This technology involves the introduction of samples directly into the mass spectrometer without sample preparation or compound separation and has been shown to have great promise for sample screening and target compound analysis. Both laboratory and field-based instruments have been developed and are being evaluated. These instruments are equipped with a specially designed direct sampling system and a set of quick connecting sampling modules for the analysis of air, water, and soil which allow the instrument to be converted from one sampling configuration to another without breaking vacuum to the ion trap. Tests of the laboratory and field DSITMS instruments have been highly successful and have demonstrated the ability to quickly and easily perform measurements of volatile organic compounds (VOCS) such as benzene, chlorinated solvents, and gasoline and in a wide range of environmental samples. Analysis times range from real time for direct air monitoring applications to approximately 3 minutes for the quantitative determination of VOCs in water and soil samples. Detection limits for VOCs in water are typically in the range of 1 to 5 ppb and in air range from 1 to 100 ppb by volume (ppbv).

24574 (CONF-9209353–1) **Biomes computed from simulated climatologies.** Max-Planck-Institut fuer Meteorologie. Report. Claussen, W.; Esch, M. Max-Planck-Institut fuer Meteorologie, Hamburg (Germany). Sep 1992. 21p. From 2. international conference on modelling of global climate change and variability; Hamburg (Germany); 7-11 Sep 1992. Order Number DE93792714. Source: OSTI; NTIS (US Sales Only).

The biome model of Prentice et al. is used to predict global patterns of potential natural plant formations, or biomes, from climatologies simulated by ECHAM, a model used for climate simulations at the Max-Planck-Institut fuer Meteorologie. This study is undertaken in order to show the advantage of this biome model in comprehensively diagnosing the performance of a climate model and assessing effects of past and future climate changes predicted by a climate model. Good overall agreement is found between global patterns of biomes computed from observed and simulated data of present climate. But there are also major discrepancies indicated by a difference in biomes in Australia, in the Kalahari Desert, and in the Middle West of North America. These discrepancies can be traced back to failures in simulated rain fall as well as summer or winter temperatures. Global patterns of biomes computed from an ice age simulation reveal that North America, Europe, and Siberia should have been covered largely by tundra and taiga, whereas only small differences are seen for the tropical rain forests. A potential North-East shift of biomes is expected from a simulation with enhanced CO_2 concentration according to the IPCC Scenario A. Little change is seen in the tropical rain forest and the Sahara. Since the biome model used is not capable of predicting changes in vegetation patterns due to a rapid climate change, the latter simulation has to be taken as a prediction of changes in conditions favorable for the existence of certain biomes, not as a prediction of a future distribution of biomes. (orig.).

24575 (CONF-921276–, pp. 227-230) **New catalyst for CO2 reduction.** Osaki, T. (Government Industrial Research Institute, Nagoya, Nagoya (Japan)); Taoda, H.; Yamakita, H. 3 Dec 1992. 305p. (In Japanese). From 1992 Japan Solar Energy Society, Japan Wind Energy Association joint converence; Osaka (Japan); 3-4 Dec 1992. In *1992 JSES (Japan Solar Energy Society)/JWEA (Japan Wind Energy Association) Joint Conference.* Order Number DE93793955. Source: OSTI; NTIS (US Sales Only).

Discussions were given on contact hydrogenation of CO2 using newly prepared catalysts to cope with the CO2 emission problem and regenerate CO2 into usable resources. Hydrogen and argon gas mixture was passed through (NH4)2WS4 at 400°C to prepare a WS2 catalyst (catalyst No. 1). Similarly, an MoS2 catalyst (catalyst No. 4) was made from (NH4)2MoS4. A contact hydrogenation reaction of CO2 at 450°C for 50 hours produced only CO as a reduction product with a selection factor of 99.9% or higher. The conversion factor from CO2 to CO was about 25% for the catalyst No. 1, and about 15% for the catalyst No. 4, which are higher than in catalysts of identical composition that are available commercially. The activation energy (kJ/mol) showed lower values from 24.7 to 20.5 than commercially available products at from 66.5 to 72.8. The catalysts No. 1 and 4 have larger surface area and lower crystallinity than those in catalysts available on the market. Chemical analysis of the subject catalysts detected a large quantity of oxygen (oxygen from CO2), which suggests that there are a large number of activation points for reduction. 3 refs., 7 figs., 3 tabs.

24576 (CONF-930701–2) **Guidance on management of nonresidential indoor air quality.** Gammage, R.B. (Oak Ridge National Lab., TN (United States)); Sowinski, E.J.; Tiffany, J. Oak Ridge National Lab., TN (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 6. international conference on indoor air quality and climate; Helsinki (Finland); 4-8 Jul 1993. Order Number DE93010278. Source: OSTI; NTIS; INIS; GPO Dep.

An interdisciplinary approach is needed for the effective recognition, evaluation, and control of indoor air quality (IAQ), which also requires a performance oriented management plan. Industrial hygienists are uniquely suited to play a central role, along with HVAC mechanical and building engineers and architects. IAQ problems are typically associated with inadequate performance of heating, ventilation, and air conditioning (HVAC) systems. Typical environmental measuring techniques, and the use of threshold limit values (TLVs), are usually not relevant to IAQ investigations. Research priorities aimed at multiple chemical sensitivity, standardization of air sampling procedures, and demonstration of technology in model buildings are presented.

24577 (DOE/ER–0586T) **Program Operations Plan: Atmospheric Chemistry Program.** USDOE Office of Energy Research, Washington, DC (United States). Office of Health and Environmental Research. Apr 1993. 105p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93012765. Source: OSTI; NTIS; GPO Dep.

The Department of Energy's Atmospheric Chemistry Program (ACP) was initiated in 1991 to coordinate DOE's university and federal-laboratory atmospheric-chemistry research, and to focus these efforts on national and international information requirements in the atmospheric-chemistry field. This Program Operations Plan describes the structure and vision of the effort designed to fulfill these needs, and is divided into two major components. The first of these is a Strategic Plan, which outlines the ACP's rationale, objectives, and vision, and describes its products that are anticipated

over a future ten-year period. Although based on realistic appraisals of goals that are attainable given the financial, material, and intellectual resources of the ACP community, this Strategic Plan does not describe these resources themselves. The second component of the Program Operations Plan, the Implementation Plan, deals directly with these resource considerations. As such it focuses on practical implementation of Strategic-Plan elements at the individual research institutions, the anticipated scientific contributions of these groups, and their coordination within the ACP. In contrast to the Strategic Plan, this Implementation Plan extends only five years into the future.

24578 (DOE/ER–0588) **Radon Research Program, FY 1992.** USDOE Office of Energy Research, Washington, DC (United States). Office of Health and Environmental Research; Oak Ridge Inst. for Science and Education, TN (United States). Apr 1993. 251p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-76OR00033. Order Number DE93013736. Source: OSTI; NTIS; INIS; GPO Dep.

The United States Department of Energy, Office of Health and Environmental Research (DOE/OHER) is the principal federal agency conducting basic research related to indoor radon. The scientific information being sought in this program encompasses research designed to determine radon availability and transport outdoors, modeling transport into and within buildings, physics and chemistry of radon and radon progeny, dose response relationships, lung cancer risk, and mechanisms of radon carcinogenesis. There still remains a significant number of uncertainties in the currently available knowledge that is used to estimate lung cancer risk from exposure to environmental levels of radon and its progeny. The main goal of the DOE/OHER Radon Research Program is to develop information to reduce these uncertainties and thereby provide an improved health risk estimate of exposure to radon and its progeny and to identify and understand biological mechanisms of lung cancer development and required copollutants at low levels of exposure. Information useful in radon control strategies is also provided by the basic science undertaken in this program.

24579 (DOE/ER/60372–8) **Recent changes of weather patterns in North America: Progress report, August 15, 1992–April 1, 1993.** Kukla, G.J. (Columbia Univ., Palisades, NY (United States). Lamont-Doherty Geological Observatory); Karl, T. Columbia Univ., Palisades, NY (United States). Lamont-Doherty Geological Observatory; National Climatic Data Center, Asheville, NC (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER60372. Order Number DE93013982. Source: OSTI; NTIS; INIS; GPO Dep.

Climate models predict a general increase of surface air temperature and drought frequency in parts of the North American continent due to increased CO_2 concentrations. Regional climate change results in part from the changed frequency of the atmospheric and oceanic circulation patterns in addition to the changed properties of the different air mass types. We are investigating the frequency and properties of the air mass types differentiated by moisture dependent variables and comparing the findings to that simulated by numerical climate models. The objectives of this project are to analyse the time related changes and variability in the properties and frequency of air masses and weather extremes over North America. To determine the agree to which the observed changes agree with climate model predictions.

24580 (DOE/ER/61417–1) **[Tools for determining health of phytoplankton cells].** Oregon Univ., Eugene, OR (United States). Dept. of Biology. [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-92ER61417. Order Number DE93015060. Source: OSTI; NTIS; GPO Dep.

The primary purpose of the proposed research is to develop molecular tools for determining the health of marine phytoplankton on an individual cell basis. Since the definition of healthy in phytoplankton cells is elusive, we propose to develop markers for several different metabolic processes indicative of physiological state: photosynthetic activity, esterase activity, membrane permeability, and mitochondrial activity. One underlying motivation is to develop methods which will allow us to evaluate the hypothesis that, while healthy cells release very little dissolved organic carbon (DOC), many phytoplankton communities are comprised of unhealthy or physiologically stressed cells which release a large proportion of total photosynthate directly into the pool of labile DOC. This is proposed to be especially true in continental shelf and coastal environments where zones of productivity are patchy and phytoplankton populations adapted to one regime can be easily transported into waters which differ in salinity, nutrient supply, and/or turbidity. The significance of the work, however, extends beyond this immediate goal since there are presently relatively few methods which allow us to estimate the physiological state of phytoplankton cells.When we evaluate population sizes of phytoplankton in the water column or examine fecal pellets, particulate aggregates, or other material, we generally work in ignorance of the activity of the cells except as the average cell-specific activity is estimated from bulk measurements. This approach effectively hides any differences in the relative contribution of different taxa or individuals to overall productivity eventhough most flux processes are sensitive to physiological and taxonomically determined differences among members of the community.

24581 (DOE/MC/29116–3355) **Novel mass spectrometric instrument for gaseous and particulate characterization and monitoring: Technical progress report, September 25, 1992–December 31, 1992.** Coggiola, M.J. SRI International, Menlo Park, CA (United States). Feb 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29116. Order Number DE93014093. Source: OSTI; NTIS; GPO Dep.

SRI International will develop a unique new instrument that will be capable of providing real-time, quantitative, chemical characterization of gaseous and particulate pollutants generated from DOE waste cleanup activities. The instrument will be capable of detecting and identifying volatile organic compounds, polynuclear aromatic hydrocarbons, heavy metals, and transuranic species released during waste cleanup activities. The instrument will be unique in its ability to detect and quantify in real-time these diverse pollutants in both vapor and particulate form. The function of the sampler is to obtain a sufficient and representative quantity of air pollutants from a wide range of waste cleanup activities, both vapor and particulate. In addition, the sampler must deliver the vapors and particles to the detection instrument with minimal material loss.

24582 (EGG–10617-1227) **An aerial radiological survey of Par Pond and associated drainage pathways of the Savannah River Site, Aiken, South Carolina: Date of survey: August 19–November 11, 1991.** EG and G Energy Measurements, Inc., Las Vegas, NV (United States). Remote Sensing Lab. Dec 1992. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-88NV10617. Order Number DE93008084. Source: OSTI; NTIS; INIS; GPO Dep.

The first of a three-phase effort to radiologically monitor the lowering of Par Pond and associated drainage pathways was conducted over three areas of the Savannah River Site (SRS). The areas surveyed during this first phase included Par Pond, the Savannah River swamp from Steel Creek to Little Hell Landing, and Lower Three Runs Creek from the mouth of Lower Three Runs to the Highway 301 Bridge. The first phase was conducted to coincide with the lowering of the water level of Par Pond to an elevation of 190 feet above sea level. Additional surveys were conducted when the water level was at an elevation of 180 feet and prior to refill. The first survey began August 19, 1991, and was completed September 11, 1991. The second survey was conducted in October/November, 1991, during the SRS site-wide survey, and the third survey was conducted in August/September, 1992. Only the Par Pond area itself was surveyed during the third and final phase. The radiation detected over the Creek Plantation portion of the Savannah River swamp and Lower Three Runs areas during the August 1991 survey was consistent with the spatial distribution, quantity, and kinds of radionuclides detected during the 1983 and 1986 surveys. No migration of man-made gamma emitting materials was detected when compared to the prior surveys. The major differences occurred along the Par Pond shoreline where lowered water levels exposed the contaminated pond bed. The activity in the pond bed was attenuated by the water cover prior to the start of the lowering of Par Pond in June 1991. The data collected during each survey were processed in the field and

were presented to SRS. A comparison report is being generated after the completion of each survey. A final report will be generated for the three surveys and will include a quantitative comparison of the three surveys in the Par Pond area only.

24583 (EML–549) **Project AIRSTREAM: Trace gas final report.** Leifer, R. Department of Energy, New York, NY (United States). Environmental Measurements Lab. Dec 1992. 164p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93008849. Source: OSTI; NTIS; INIS; GPO Dep.

The results of 10 years of sampling for trace gases in the upper troposphere and lower stratosphere are presented. These samples were collected under the auspices of the Atomic Energy Commission (AEC), the Energy Research and Development Administration (ERDA) and the Department of Energy (DOE). Almost 1000 whole air samples were collected during the years 1973 to 1983 under Project AIRSTREAM. Project AIRSTREAM was part of the Environmental Measurements Laboratory's (EML, at that time called the Health and Safety Laboratory/HASL) research effort to investigate the impact of the injection of radionuclides and stable compounds into the stratosphere. One or more of the following compounds were analyzed: CCl_3F, CCl_2F_2, CCl_4, N_2O, SF_6, CO_2, CH_4, CH_3CCl_3, and COS. Details of the Project's quality assurance program are discussed. Also included in the report are two-dimensional plots of the concentration of CCl_3F and a complete tabulation of the data.

24584 (ES/ER/TM–62) **Aerial remote sensing surveys progress report: Helicopter geophysical survey of the Oak Ridge Reservation.** Doll, W.E. (Oak Ridge National Lab., TN (United States)); Nyquist, J.E.; King, A.D.; Bell, D.T.; Holladay, J.S.; Labson, V.F.; Pellerin, L. Oak Ridge National Lab., TN (United States). Mar 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011828. Source: OSTI; NTIS; INIS; GPO Dep.

The 35,252 acre Department of Energy Oak Ridge Reservation (ORR) in the western portion of the Appalachian Valley and Ridge Province in Tennessee, has been a nuclear production and development facility for50 years. Contaminants in the many waste sites on the ORR include a wide variety of radioactive isotopes as well as many organic and inorganic compounds. The locations, geometry, and contents of many of these waste sites are reasonably well known, while others are poorly known or unknown. To better characterize the reasonably well known sites and search for additional potentially environmentally hazardous sites, a two-phase aerial survey of the ORR was developed. Phase I began in March 1992 and consisted of aerial radiation, multispectral scanner, and photographic (natural color and color infrared) surveys. Phase II began in November 1992 and is described in this report. Phase II consisted of helicopter electromagnetic (HEM), magnetic, and gamma radiation surveys. Targets of the survey included both man-made (drums, trench boundaries, burn pits, well heads) and geologic (fractures, faults, karst features, geologic contacts) features. The Phase II survey has three components: testing, reconnaissance, and high-resolution data acquisition. To date, the testing and reconnaissance data acquisition have been completed, and some of the data have been processed. They indicate that: (1) magnetic and HEM data are complementary and do not always highlight the same anomaly; (2) under favorable circumstances, helicopter magnetometer systems are capable of detecting groups of four or more 55-gal drums at detector altitudes of 15 m or less; (3) HEM data provide data that compare favorably with surface data collected over burial trenches, (4) well casings may be related to magnetic monopole anomalies, as would be expected; and (5) changes in HEM and magnetic anomaly character are related to lithologic changes and may be used to track contacts between known outcrops.

24585 (ETDE-mf–93792551) **Remote sensing of cloud base temperature of convective clouds over the ocean.** Berichte aus dem Zentrum fuer Meeres- und Klimaforschung der Universitaet Hamburg. Manschke, A. Hamburg Univ. (Germany). Zentrum fuer Meeres- und Klimaforschung; Hamburg Univ. (Germany). Fachbereich 15 - Geowissenschaften. 1991. 114p. (In German). Order Number DE93792551. Source: OSTI; NTIS (US Sales Only).

The possibility to derive the cloud base temperature by remote sensing for convective cloudfields over oceans with the spaceborne infrared radiometer AVHRR is investigated. First, a set of atmospheric data for polar cold air outbreaks is prescribed, containing different cloud base temperature, cloud droplet size distributions, and other parameters influencing the radiative transfer properties. Top of the atmosphere radiances are then calculated with the help of a one-dimensional adding and doubling model of radiative transfer in order to simulate the expected signals in the thermal infrared channels of the AVHRR. Finally, the effect of cloud base temperature on the radiation budget of the ocean surface is estimated. Results of radiative transfer calculations show an increase of longwave downward flux densities by up to 90 W/m^2 for the cloud covered sky as compared to cloudless conditions. This considerable increase is due to the low water vapour amount in polar boundary layers. The sensitivity of the longwave net flux density to cloud base temperature is about 2 W/m^2 per Kelvin. (orig.).

24586 (ETDE-mf–93792573) **Development and practical use of a mobile lidar system to measure the ozone concentration in the troposphere up to 13 km high by means of differential absorption. Final report.** Carnuth, W.; Trickl, T. Fraunhofer-Institut fuer Atmosphaerische Umweltforschung (IFU), Garmisch-Partenkirchen (Germany); Bundesministerium fuer Forschung und Technologie, Bonn (Germany). 1 Feb 1992. 32p. (In German). Contract BMFT 07EU7104. Order Number DE93792573. Source: OSTI; NTIS (US Sales Only).

In the context of this project, a UV lidar system was developed to measure the change with time of the vertical ozone distribution in the troposphere between about 0.1 km and 12 km above the site of the lidar (740 m above 0D). This very large range of measurement with regard to the back scatter signal reduced by more than six orders of magnitude in the troposphere is achieved by the use of a powerful KrF laser, two separate receiving telescopes and various electronic circuits. The accuracy of measurement estimated in the description of project (5 to 15 ppbv depending on height) was proved. It was found that considerable improvements are even possible. In 1991, a first complete year's series of ozone soundings of over 500 individual measurements was carried out. It was found that the lidar equipment represents a valuable supplement to the mountain stations operated by the IFU. (orig.) With 6 refs., 12 figs.

24587 (ETDE-mf–93795279) **Investigations into the chemistry of atmospheric peroxides. Final report. Pt. A and B.** Forschungsberichte zum Forschungsprogramm des Landes Nordrhein-Westfalen 'Luftverunreinigungen und Waldschaeden'. Becker, K.H. (Wuppertal Univ. (Gesamthochschule) (Germany). Lehrgebiet Physikalische Chemie); Brockmann, K.J.; Bechara, J.; Klockow, D.; Cramer, C.; Esser, G.; Hoffmann, T.; Jacob, P.; Troost, G.; Valdes, J. Wuppertal Univ. (Gesamthochschule) (Germany). Lehrgebiet Physiaklische Chemie; Institut fuer Spektrochemie und Angewandte Spektroskopie (ISAS), Dortmund (Germany); Ministerium fuer Umwelt, Raumordnung und Landwirtschaft des Landes Nordrhein-Westfalen, Duesseldorf (Germany). Jun 1992. 161p. (In German). Order Number DE93795279. Source: OSTI; NTIS (US Sales Only).

This project investigates the atmospheric-chemical behaviour of hydroperoxides as a part of the atmospheric oxidants blamed for contributing to novel forest decline. In particular, the investigations covered such processes as form hydrogen peroxide in the gas or liquid phase or on icy surfaces, by the effect of light or by reactions of ozone with biogenous alkenes. A diode laser spectroscope was used in combination with a long-path infra-red absorption cell and a temperature-adjustable photoreactor for studying the reactions of ozone with different terpenes and some non-biogenic alkenes, under atmospheric conditions, regarding H_2O_2 formation. The reaction with water vapour of the intermediate products from the ozone/terpene reactions represents a hitherto unknown source of H_2O_2 in forest air. This formation of H_2O_2 acquires importance particularly where high levels of atmospheric NO (> 10 pptV) and ozone occur at a close distance to intense sources of biogenic alkenes. (orig./EF).

24588 (ETDE-mf–93795282) **Optimal fingerprints for the detection of time dependent climate change.** Max-Planck-Institut fuer Meteorologie. Report. Hasselmann, K. Max-Planck-Institut fuer

Meteorologie, Hamburg (Germany). Aug 1992. 43p. Order Number DE93795282. Source: OSTI; NTIS (US Sales Only).

An optimal linear filter (fingerprint) is derived for the detection of a given time-dependent, multi-variate climate-change signal in the presence of natural climate variability noise. Application of the fingerprint to the observed (or model-simulated) climate data yields a climate-change detection variable (detector) with maximal signal-to-noise ratio. The optimal fingerprint is given by the product of the assumed signal pattern and the inverse of the climate variability covariance matrix. The data can consist of any, not necessarily dynamically complete climate data set for which estimates of the natural variability covariance matrix exist. The single-pattern analysis readily generalizes to the multi-pattern case of a climate-change signal lying in a prescribed (in practice relatively low-dimensional) signal-pattern space: the single-pattern result is simply applied separately to each individual base pattern spanning the signal pattern space. Multi-pattern detection methods can be applied either to test the statistical significance of individual components of a predicted multi-component climate change response, using separate single-pattern detection tests, or to determine the statistical significance of the complete signal, using a multi-variate test. (orig.).

24589 (ETDE-mf–93795284) **Simulation of the present-day climate with the ECHAM model: Impact of model physics and resolution.** Max-Planck-Institut fuer Meteorologie. Report. Roeckner, E. (Max-Planck-Institut fuer Meteorologie, Hamburg (Germany)); Arpe, K.; Bengtsson, L.; Duemenil, L.; Esch, M.; Brinkop, S.; Ponater, M.; Sausen, R.; Kirk, E.; Lunkeit, F.; Schubert, S.; Windelband, M.; Rockel, B. Max-Planck-Institut fuer Meteorologie, Hamburg (Germany). Oct 1992. 175p. Order Number DE93795284. Source: OSTI; NTIS (US Sales Only).

A detailed description of the third-generation atmospheric general circulation model ECHAM is presented. The climatology of ECHAM3, as simulated at low and high resolution (T21 and T42, respectively), is compared with ECMWF analyses (1981-1990) and also with the climatology of two earlier low resolution versions ECHAM1 and ECHAM2. At low resolution, the impact of the improved model physics is evident primarily in the simulated time-mean state which is more successfully reproduced by the more recent model versions, particularly by ECHAM3. The impact of increased horizontal resolution can be identified not only by a generally improved time-mean circulation, particularly in the Southern Hemisphere, but most-significantly by the increased level of high-frequency variability. In the low-frequency range, however, the impact of increased horizontal resolution is modest, and all models fail to reproduce the observed level of low-frequency intraseasonal variability. (orig.).

24590 (ETDE-mf–93795285) **Signal-to-noise analysis of time-dependent greenhouse warming experiments. Pt. 1. Pattern analysis.** Max-Planck-Institut fuer Meteorologie. Report. Santer, B.D. (Lawrence Livermore Lab., CA (United States). Program for Climate Model Diagnosis and Intercomparison); Brueggemann, W.; Cubasch, U.; Hasselmann, K.; Hoeck, H.; Maier-Reimer, E.; Mikolajewicz, U. Max-Planck-Institut fuer Meteorologie, Hamburg (Germany). Jan 1993. 54p. Order Number DE93795285. Source: OSTI; NTIS (US Sales Only).

Results from a control integration and time-dependent greenhouse warming experiments performed with a coupled ocean-atmosphere model are analysed in terms of their signal-to-noise properties. The aim is to illustrate techniques for efficient description of the space-time evolution of signals and noise and to identify potentially useful components of a multivariate greenhouse-gas 'fingerprint'. The three 100-year experiments analysed here simulate the response of the climate system to a step-function doubling of CO_2 and to the time-dependent greenhouse-gas increases specified in Scenarios A ('Business as Usual') and D ('Draconian Measures') of the Intergovernmental Panel on Climate Change (IPCC). (orig.).

24591 (ETDE-mf–93795286) **Air pollution by polycyclic aromatic hydrocarbons (PAH) in the city of Hamburg.** Hamburger Umweltberichte. Kersten, W.; Reich, T. Umweltbehoerde, Hamburg (Germany). 1992. 110p. (In German). Order Number DE93795286. Source: OSTI; NTIS (US Sales Only).

Polycyclic aromatic hydrocarbons (PAH) and their leader components benzo(a)pyrenes (BaP) are considered critical air pollutants on account of their carcinogenic action. PAH/BaP air pollution in the city of Hamburg was assessed in the course of a twelve-months' test program in 1989/90. Mean annual values were determined for 22 PAH constituents in eight selected areas of different air qualities. Twenty samples were taken in each measuring place. In addition to the usual analyses of PAH bound in airborne particles 60 out of 160 samples were analyzed for constituents which pass the filter. Air pollution by PAH bound in airborne particles and by PAH which pass the filter was put at 15 ng/m^3 or 24 ng/m^3, respectively for the sum of the 22 PAH constituents. A concentration of about 0.9 ng/m^3 was found for benzo(a)pyrenes. Higher values were measured in places located in the vicinity of frequented roads or residential buildings with coal-fired space heating systems. The city of Hamburg was found to be ranking with the less polluted crowded areas. (orig./BBR).

24592 (ETDE-mf–93796945) **Economic Commission for Europe NO_x Task Force 'Operating experience with NO_x abatement at stationary sources'.** Rentz, O.; Ribeiro, J. Karlsruhe Univ. (T.H.) (Germany). Inst. fuer Industriebetriebslehre und Industrielle Produktion. Dec 1992. 325p. Order Number DE93796945. Source: OSTI; NTIS (US Sales Only).

The report gives an overview of the operational experience of NO_x abatement technologies at stationary sources and the implementation status of these technologies in the various emission sectors. Besides this, NO_x emission data of some ECE countries are listed and a compilation of the regulative measures for NO_x emissions control of several ECE countries is given. The report is based on information submitted by Task Force members and from data published elsewhere, as well as from plant operators. (orig.).

24593 (FEMP–2270) **Statistical analysis of real-time, environmental radon measurement results at the Fernald Environmental Management Project.** Liu, Ning (Univ. of Cincinnati, OH (United States). Dept. of Mechanical, Industrial, and Nuclear Engineering); Spitz, H.; Dai, L.; Tomczak, L. Westinghouse Environmental Management Co. of Ohio, Cincinnati, OH (United States). Fernald Environmental Management Project. Sep 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-86OR21600. (CONF-930130–15: 26. Health Physics Society midyear topical meeting on environmental health physics; 38. annual conference on bioassay, analytical and environmental radiochemistry, Coeur d'Alene, ID (United States); Santa Fe, NM (United States), 24-28 Ja Order Number DE93012894. Source: OSTI; NTIS; INIS; GPO Dep.

A comprehensive real-time, environmental radon monitoring program is being conducted at the Fernald Environmental Management Project (FEMP) where approximately 8,800 metric tons of uranium residues produced during operation of the plant have been stored in underground, covered silos since the 1950's. Statistical analyses of the radon measurements were undertaken to investigate what impact, if any, radon emitted by the radium bearing materials contained in the silos makes to the natural background radon concentration. For evaluation purposes, the site was divided into four general areas; (1) the site boundary or perimeter, (2) the production/administration areas, (3) the waste storage areas (silos), and (4) offsite background located approximately 13 km away from FEMP. Results from monitors located in each of the four areas were analyzed independently and as group by area to investigate the temporal and spatial variations in the measurements. A series of contrast tests applied to the radon measurement results obtained from February 1991 and 1992 demonstrate that, at any nine, the radon concentration is statistically equal (at the 95% confidence level) in all areas of the FEMP except for the silo area. That is, differences in the measured radon concentration in and around the FEMP during 1991 and 1992 were not detectable at any area unless you were very close to the silos. In November, 1991, a new sealant barrier was applied to the silos which appears to have significantly reduced the radon concentration near the source but made no detectable reduction elsewhere.

24594 (GKSS–92/E/51) **Numerical modeling of the transport and chemical transformation of mercury over Europe.** Petersen, G. (GKSS-Forschungszentrum Geesthacht GmbH,

Geesthacht-Tesperhude (Germany). Inst. fuer Physik). GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany); Hamburg Univ. (Germany). Fachbereich 15 - Geowissenschaften. 1992. 153p. (In German). Order Number DE93792029. Source: OSTI; NTIS (US Sales Only).

Numerical models based on the transport and diffusion module of the EMEP model have been developed to investigate the long-range transport, the chemical transformation and the atmospheric deposition of mercury. A number of physical and chemical processes of atmospheric mercury recently investigated in Sweden have been implemented into the model. Model runs were focussed on estimates of atmospheric mercury input into the North Sea and the Baltic Sea and on scenario runs on divalent inorganic mercury compounds and on the role of soot particles for the atmospheric mercury load. Since the model has been successfully verified with Scandinavian land-based measurements, the calculated range of 5-12 tonnes mercury per year for the North Sea and 6-13 tonnes per year for the Baltic are considered to be the most reliable data currently available. (orig.) With70 figs., 20 tabs.

24595 (LA-UR–93-857) **Regional climatology sensitivity studies.** Bossert, J.E. (Los Alamos National Lab., NM (United States)); Kao, C.Y.J.; Winterkamp, J.L.; Roads, J.O.; Chen, Shyh-C. Los Alamos National Lab., NM (United States). Feb 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9303122–1: 3. ARM science team meeting, Norman, OK (United States), 1-5 Mar 1993). Order Number DE93010712. Source: OSTI; NTIS; GPO Dep.

Recent interest in understanding climate and climate change at regional-scales has led to the application of mesoscale models for regional climatology studies. These models can provide an understanding of climate processes in a physically consistent way at much higher resolution than presently offered by GCMs. In recent work, we have tried to address questions in the RAMS mesoscale model to establish confidence in our modeling procedure. A more rigorous comparison of our modeling results with various data sets is reported in Roads et al. (1992). In the present paper, we use two simple numerical experiments to examine the impact of grid configuration on the predicted precipitation field from the RAMS model. We intend to demonstrate that the choice of the lateral boundaries and grid configurations can significantly impact the predicted fields of interest.

24596 (NEI-DK–1102) **Objectives for next generation of practical short-range atmospheric dispersion models: Proceedings of the workshop.** Olesen, H.R.; Mikkelsen, T. (eds.). Dansk Center for Atmosfaereforskning (DCAR), Roskilde (Denmark). 1992. [271p.] (CONF-9205345–: Workshop on objectives for next generation of practical short-range atmospheric dispersion models, Roskilde (Denmark), 6-8 May 1992). Order Number DE93625642. Source: OSTI; NTIS; INIS.

The proceedings contains papers from the workshop "Objectives for Next Generation of Practical Short-Range Atmospheric Dispersion Models". They deal with two types of models, namely models for regulatory purposes and models for real-time applications. The workshop was the result of an action started in 1991 for increased cooperation and harmonization within atmospheric dispersion modelling. The focus of the workshop was on the management of model development and the definition of model objectives, rather than on detailed model contents. It was the intention to identify actions that can be taken in order to improve the development and use of atmospheric dispersion models. The papers in the proceedings deal with various topics within the broad spectrum of matters related to up-to-date practical models, such as their scientific basis, requirements for model input and output, meteorological preprocessing, standardisation within modelling, electronic information exchange as a potentially useful tool, model evaluation and data bases for model evaluation. In addition to the papers, the proceedings contain summaries of the discussions at the workshop. These summaries point to a number of recommended actions which can be taken in order to improve "modelling culture". (AB).

24597 (NEI-DK–1102, pp. 41-48) **Standardization in the field of air quality: Activities of ISO and CEN.** Grefen, K. (Kommission Reinhaltung der Luft im VDI und DIN (Germany)); Weber, K. Dansk Center for Atmosfaereforskning (DCAR), Roskilde (Denmark). 1992. (CONF-9205345–: Workshop on objectives for next generation of practical short-range atmospheric dispersion models, Roskilde (Denmark), 6-8 May 1992). In *Objectives for next generation of practical short-range atmospheric dispersion models: Proceedings of the workshop.* [271p.] Order Number DE93625642. Source: OSTI; NTIS; INIS.

The importance of guidelines and standards related to air pollution abatement technology is explained, also in relation to the European Single Market. The responsibilities of the joint committee of "Verein Deutscher Ingenieure" and "Deutsches Institut fuer Normung" in producing guidelines for air quality protection in Germany, and their organization and scope are clarified. The CEN (Comite Europeen de Normalisation) is also dealt with and some of its activities are described. The activities and scope of the International Organization for Standardization (ISO) are elucidated. The author concludes that all European national institutions for standardization should take a more active part in standard setting procedures, via CEN. (AB).

24598 (NEI-DK–1102, pp. 49-61) **Summary of 19. NATO/CCMS international technical meeting (ITM) round table discussion on the harmonization of atmospheric dispersion models.** Irwin, J.S. (Atmospheric Sciences Modeling Division, Air Resources Laboratory, National Oceanic and Atmospheric Administration, (United States)). Dansk Center for Atmosfaereforskning (DCAR), Roskilde (Denmark). 1992. (CONF-9205345–: Workshop on objectives for next generation of practical short-range atmospheric dispersion models, Roskilde (Denmark), 6-8 May 1992). In *Objectives for next generation of practical short-range atmospheric dispersion models: Proceedings of the workshop.* [271p.] Order Number DE93625642. Source: OSTI; NTIS; INIS.

A Round Table discussion was held at the 19th NATO/CCMS Conference on Atmospheric Dispersion with participation of approximately 50 scientists involved with various aspects of air quality assessment from over 15 countries. The premise of discussion was there is a need within the European Countries to provide a basis for developing an approach towards harmonization of air quality modeling. The term "harmonization" was used mostly in the sense that for the same input a simulation model would compute the same output. Concern was expressed that this usage was overly simplistic, prohibitively restrictive and counterproductive. The main benefits of achieving harmonization were 1) proper use of available meteorological data and 2) consistent treatment of source impacts throughout the European Community. The challenge before the European Community is to resolve in a realistic manner the problem of assessing environmental impacts in a manner that is fair throughout the European Community and proper within the scientific community. The resolution will involve compromises between 'being fair' and 'being state-of-the-science'. Accuracy and realism may be willingly sacrificed in order to achieve fairness. Developing consensus on how and what is to be achieved in the process of harmonization will involve difficult value judgments. But the consensus process should be encouraged given the significant and worthwhile benefits. (au).

24599 (NEI-DK–1102, pp. 63-75) **Improving practical atmospheric dispersion models: The scientific basis.** Hunt, J.C.R. (U.K. Meteorological Office, Bracknell (United Kingdom)); Hudson, B.; Thomson, D.J. Dansk Center for Atmosfaereforskning (DCAR), Roskilde (Denmark). 1992. (CONF-9205345–: Workshop on objectives for next generation of practical short-range atmospheric dispersion models, Roskilde (Denmark), 6-8 May 1992). In *Objectives for next generation of practical short-range atmospheric dispersion models: Proceedings of the workshop.* [271p.] Order Number DE93625642. Source: OSTI; NTIS; INIS.

The new generation of practical atmospheric dispersion model (for short range $\leq$ 30 km) are based on dispersion science and boundary layer meteorology which have widespread international acceptance. In addition, recent improvements in computer skills and the widespread availability of small powerful computers make it possible to have new regulatory models which are more complex than the previous generation which were based on charts and simple formulae. This paper describes the basis of these models and how they have developed. Such models are needed to satisfy the

urgent public demand for sound, justifiable and consistent environmental decisions. For example, it is preferable that the same models are used to simulate dispersion in different industries; in many countries at present different models are used for emissions from nuclear and fossil fuel power stations. The models should not be so simple as to be suspect but neither should they be too complex for widespread use; for example, at public inquiries in Germany, where simple models are mandatory, it is becoming usual to cite the results from highly complex computational models because the simple models are not credible. This paper is written in a schematic style with an emphasis on tables and diagrams. (au) (22 refs.).

24600 (NEI-DK–1102, pp. 77-85) **Effects of data limitations on hopes for improved short range atmospheric dispersion models.** Hanna, S.R. (Sigma Research Corporation, Concord, MA (United States)). Dansk Center for Atmosfaereforskning (DCAR), Roskilde (Denmark). 1992. (CONF-9205345–: Workshop on objectives for next generation of practical short-range atmospheric dispersion models, Roskilde (Denmark), 6-8 May 1992). In *Objectives for next generation of practical short-range atmospheric dispersion models: Proceedings of the workshop.* [271p.] Order Number DE93625642. Source: OSTI; NTIS; INIS.

The author identifies areas in which short-range dispersion models, in relation to air pollution, can be improved. Emphasis is on boundary layer parameterizations, which feed directly into plume rise and dispersion algorithms. The topics of mixing depth, vertical profiles of turbulence temperature and wind speed, the formation of the nocturnal jet, non-steady state periods, surface constants, moisture parameters, roughness length, surface energy balance relations and Lagrangian time scales are dealt with. (AB).

24601 (NEI-DK–1102, pp. 87-94) **Harmonization in the preprocessing of meteorological data for dispersion models.** Thompson, N. (Meteorological Office, Bracknell (United Kingdom)). Dansk Center for Atmosfaereforskning (DCAR), Roskilde (Denmark). 1992. (CONF-9205345–: Workshop on objectives for next generation of practical short-range atmospheric dispersion models, Roskilde (Denmark), 6-8 May 1992). In *Objectives for next generation of practical short-range atmospheric dispersion models: Proceedings of the workshop.* [271p.] Order Number DE93625642. Source: OSTI; NTIS; INIS.

It is suggested that the National Meteorological Services should attempt to coordinate the methods they will use to provide the data for predicting atmospheric dispersion models regarding air pollution. Standard data need significant processing in order to provide the fundamental parameters which will eventually represent meteorological influences in all methods of dispersion prediction. The paper outlines a framework intended to lead to uniform responses to the requirements of dispersion modellers'. (AB).

24602 (NEI-DK–1102, pp. 99-107) **Boundary layer parameterizations and long-range transport.** Irwin, J.S. (Atmospheric Sciences Modeling Division, Air Resources Laboratory, National Oceanic and Atmospheric Administration, NC (United States)). Dansk Center for Atmosfaereforskning (DCAR), Roskilde (Denmark). 1992. (CONF-9205345–: Workshop on objectives for next generation of practical short-range atmospheric dispersion models, Roskilde (Denmark), 6-8 May 1992). In *Objectives for next generation of practical short-range atmospheric dispersion models: Proceedings of the workshop.* [271p.] Order Number DE93625642. Source: OSTI; NTIS; INIS.

A joint work group between the American Meteorological Society (AMS) and the EPA is perusing the construction of an air quality model that incorporates boundary layer parameterizations of dispersion and transport. This model could replace the currently accepted model, the Industrial Source Complex (ISC) model. The ISC model is a Gaussian-plume multiple point-source model that provides for consideration of fugitive emissions, aerodynamic wake effects, gravitational settling and dry deposition. A work group of several Federal and State agencies is perusing the construction of an air quality modeling system for use in assessing and tracking visibility impairment resulting from long-range transport of pollutants. The modeling system is designed to use the hourly vertical profiles of wind, temperature and moisture resulting from a mesoscale meteorological processor that employs four dimensional data assimilation (FDDA). FDDA involves adding forcing functions to the governing model equations to gradually "nudge" the model state toward the observations (12-hourly upper air observations of wind, temperature and moisture, and 3-hourly surface observations of wind and moisture). In this way it is possible to generate data sets whose accuracy, in terms of transport, precipitation, and dynamic consistency is superior to both direct interpolation of synoptic-scale analyses of observations and purely predictive mode model result. (AB) (19 refs.).

24603 (NEI-DK–1102, pp. 109-130) **Atmospheric dispersion models for real-time application in the decision support system being developed within the CEC.** Mikkelsen, T. (Department of Meteorology and Wind Energy, Risoe National Laboratory, Roskilde (Denmark)). Dansk Center for Atmosfaereforskning (DCAR), Roskilde (Denmark). 1992. (CONF-9205345–: Workshop on objectives for next generation of practical short-range atmospheric dispersion models, Roskilde (Denmark), 6-8 May 1992). In *Objectives for next generation of practical short-range atmospheric dispersion models: Proceedings of the workshop.* [271p.] Order Number DE93625642. Source: OSTI; NTIS; INIS.

A number of Commission of the European Communities member states are presently coordinating their research and development of a "Real-time On-line DecisiOn Support" (RODOS) for emergency assistance in the event of nuclear accident. In addition to atmospheric dispersion, the system involves multiple other radiological disciplines. The ability to estimate a specific atmospheric dispersion scenarios in real-time becomes a first-priority task and is of uttermost importance for the subsequent success or failure of such a comprehensive decision support system to guide off-site emergency situations. No single dispersion model is at present able to cover all possible release-types and scales of dispersion. A hierarchy of atmospheric flow and dispersion models is presently being ranked for suitability to real-time calculate air and integrated-air concentrations. Starting at the short-range scale, models are discriminated with respect to principle, adequacy and flexibility, CPU-time constraints, experimental evaluation record, instantaneous or short-time release handling, deposition measures (wet and dry), input and output data flexibility and uncertainty-handling and model-interpretation. Additional features of particular importance are: Robustness in schemes for meteorological preprocessing of meteorological input data, and on-line backfitting and data-assimilation procedures. Models demonstrating practical and operational use, including real-time operational experience, have in this context the highest priority, as opposed to the more sophisticated and theoretical "development-type" models. Real-time methods founded on our present knowledge and data concerning flow and dispersion in the atmospheric boundary layer, are of primary interest. (au) (18 refs.).

Based on standards of EPA and IEEE, quality criteria have been formulated which address the development of air pollution models, the transformation towards user-friendly software and "after-sales" service. A Dutch standard on the description of air pollution models is being finalized. The standard formulates minimal requirements on the theoretical and practical description of models. This paper provides a survey of the quality criteria and it summarizes the standard. Further, the current practice of model development at RIVM is discussed. (au) (24 refs.).

The UK Atmospheric Dispersion Modelling System is described in considerable detail. The principle modules are dealt with. A key to the methodology is that vertical profiles of mean velocity, temperature and turbulence in the boundary layer depend on the relative values of the height above the ground, the height of the boundary layer, and a length scale determined by the friction velocity and the heat flux and air temperature at the surface. The models can be used at any location. (AB) (15 refs.).

Mainly in polluted urban and industrial areas, a real-time prediction system has to be set up in order to be able to give the alarm whenever the forecast concentrations of sulfur dioxide etc. in the air exceed the legal limits, so that appropriate action can be taken in order to prevent critical episodes. A good tool for this purpose could be the class of "grey box" stochastic models for computerized simulation which make use of current and past concentration measures together with meteorological and emission data. The parameters of the model can assume different sets of values according to different categories in order to better simulate non-stationary behaviours of pollutant concentrations, mainly in situations of forthcoming critical episodes. The model is further described. (AB).

On 1 April 1991 a new regime for industrial pollution control was introduced in England and Wales: Integrated Pollution Regulation (IPR). For those industrial processes which involve releases of pollutants into the atmosphere, the relevant primary legislation includes: the Environmental Protection Act 1990, which established a system of Integrated Pollution Control for those industries which have the greatest potential to cause pollution, and the Radioactive Substances Act 1960, which is concerned with the regulation of radioactive releases. There is a requirement for the operator of a process to make an application to HMIP for authorization to operate the process and dispose of waste arisings, and an environmental impact assessment must form part of that application. HMIP does not prescribe the type of assessment techniques that the applicant should use. But the Inspectorate will audit the applicant's assessment, and also carry out its own calculations if appropriate. The assessment standards used by HMIP are being published in the form of "Chief Inspector's Guidance to Inspectors", which can be referred to by applicants. HMIP makes use of both short-range and longer-range atmospheric dispersion models to fulfill its regulatory duties. Within the former category, the Inspectorate is one of the UK organisations which is sponsoring the development of the UK-ADMS model. (AB).

The key requirements of air pollution dispersion models used in the public domain are: clear objectives and limits to applicability, full and open documentation, unambiguous version control, openly reported performance evaluation and unrestricted use or availability. Model documentation must be openly available, either through the public domain or commercial spheres. It should be adequately detailed and supported by sufficient references for a third party to be able to create an effectively identical model. Unrestricted access must exist to either the model itself or to its use (through third parties). Version control must be sufficiently tight to identify unambiguously the actual model used in any particular application. The skill in developing standards and guidelines is to avoid the imposition of unnecessarily excessive overheads on model development. Simple tests for the level required can be based on the consequences of error in the final product or the economic value of decisions based on the application of the product. A particular problem lies in dealing in a reasonable manner with models currently in use. Here, the aim is to work towards the same overall standards through a form of backward quality assurance. Guidelines for model development are presented. (AB).

24622 (NEI-DK–1102, pp. 225-241) **Tracer experiment data sets for the verification of local and meso-scale atmospheric dispersion models including topographic effects: Acquisition, storage and distribution of the data sets.** Sartori, E. (OECD/NEA Data Bank, Issy les Moulineaux (France)); Schuler, W. Dansk Center for Atmosfaereforskning (DCAR), Roskilde (Denmark). 1992. (CONF-9205345–: Workshop on objectives for next generation of practical short-range atmospheric dispersion models, Roskilde (Denmark), 6-8 May 1992). In *Objectives for next generation of practical short-range atmospheric dispersion models: Proceedings of the workshop.* [271p.] Order Number DE93625642. Source: OSTI; NTIS; INIS.

Software and data for nuclear energy applications are acquired, tested and distributed by several information centres; in particular, relevant computer codes are distributed internationally by the OECD/NEA Data Bank (France) and by ESTSC and EPIC/RSIC (United States). This activity is coordinated among the centres and is extended outside the OECD area through an arrangement with the IAEA. This article proposes more specifically a scheme for acquiring, storing and distributing atmospheric tracer experiment data (ATE) required for verification of atmospheric dispersion models especially the most advanced ones including topographic effects and specific to the local and meso-scale. These well documented data sets will form a valuable complement to the set of atmospheric dispersion computer codes distributed internationally. Modellers will be able to gain confidence in the predictive power of their models or to verify their modelling skills. (au).

24623 (NEI-DK–1102, pp. 203-207) **The Dutch standard on the description of air pollution models.** Noordijk, H. (National Institute of Public Health and Environmental Protection (RIVM), Bilthoven (Netherlands)). Dansk Center for Atmosfaereforskning (DCAR), Roskilde (Denmark). 1992. (CONF-9205345–: Workshop on objectives for next generation of practical short-range atmospheric dispersion models, Roskilde (Denmark), 6-8 May 1992). In *Objectives for next generation of practical short-range atmospheric dispersion models: Proceedings of the workshop.* [271p.] Order Number DE93625642. Source: OSTI; NTIS; INIS.

This standard establishes requirements which the description of mathematical models for air quality has to meet. The standard is applicable to models which assist in calculating the concentration of compounds in the air and/or the deposition. Users should be able to judge the usefulness of a mathematical model for their own use on the basis of its description. This is often necessary for granting licences or policy planning. Equipment, software and other requirements are not given. The description of a mathematical model should give the user a good insight into the value of the model and the results obtained. To do this the field of application and the underlying scientific concepts should be clearly described. Besides the results of possible validation procedures the way in which broader acceptance is aimed at and the degree to which this is achieved has to be reflected. (au).

24624 (NEI-DK–1102, pp. 209-224) **Characteristics of a third generation regulatory models.** Kallos, G. (University of Athens, Department of Applied Physics, Meteorology Lab., Athens (Greece)); Pilinis, C.; Kassomenos, P.; Hatzakis, G. Dansk Center for Atmosfaereforskning (DCAR), Roskilde (Denmark). 1992. (CONF-9205345–: Workshop on objectives for next generation of practical short-range atmospheric dispersion models, Roskilde (Denmark), 6-8 May 1992). In *Objectives for next generation of practical short-range atmospheric dispersion models: Proceedings of the workshop.* [271p.] Order Number DE93625642. Source: OSTI; NTIS; INIS.

A new class of air pollution dispersion models has to be used for regulatory purposes in the future and they should have the following capabilities: Adequate spatial and temporal characterization of the PBL, wind and turbulence fields, enhancement and regionalization of existing air quality models to yield a model applicable on both urban and regional scales, adequate characterization of the chemical transformation of the gaseous pollutants in the atmosphere, adequate description of the dispersion and the physical changes of the toxic material released (i.e. evaporation and condensation), good description of the chemistry in aqueous phases, like fog and cloud chemistry, and accurate predictions of the removal processes of the gas and particulate matter (i.e. wet an dry deposition). Some of these model requirements are already satisfied in some research oriented models. In general, there is no unique model that satisfies all of the above, and even if it existed there is not the necessary database for such application and testing. The two major areas of development of regulatory modeling in the future, i.e. development of a complete meteorological and air quality model and development of the database capabilities for the routine application of the model, in the urban and rural areas of interest. With the computer power available in the near future, this kind of models will be able to be used even for emergency cases. (AB) (20 refs.).

24625 (NEI-DK–1143) **CO_2 technology: A literature study on the extraction and deposition of CO_2 from flue gases.** Matre, M. (Berdal Stroemme a.s. (Norway)); Olshausen, A.; Lindland, K. Nordisk Gasteknisk Center, Hoersholm (Denmark). Mar 1993. 59p. (In Norwegian). Order Number DE93794683. Source: OSTI; NTIS.

Extraction of carbon dioxide and deposition would be most feasible for large amounts of CO_2. This study is based on a 700 MWel gas-fired power station in use for 7400 hours per annum, producing 2.2 million tons CO_2 per annum. Absorption with amines, adsorption processes, use of seawater and use of chemicals are the methods of carbon dioxide extraction described. In the case of a absorption by amines, the gases are absorbed into a fluid. This process is the most promising so far for extracting CO_2 from fossil fuel flue gas. The most useful amines are Monoethanol and Diethanol. Adsorption is a separation process where gas or liquid comes in contact with a porous substance and components of the gas or liquid accumulate in that substance. It is expensive on account of the large quantities of exhaust gases. Use of seawater is a technically feasible method of removing CO_2, but requires very large quantities of water. There are several chemicals which combine with CO_2 more or less permanently but production of these requires so much energy, that a similar amount of CO_2 is produced. Recycling up to 40% of the exhaust gas will increase the CO_2 concentration and reduce the water and CO_2 content. This simplifies the extraction of CO_2. A pipeline is the best method for transporting 2.2 million tons of CO_2 as a gas or liquid with a typical pipeline pressure of 100 bar or more. Possibilities for depositing CO_2 are ocean disposal, depositing in aquifers, depositing in exhausted oil or gas reservoirs, land deposits and deposition in salt domes. These methods are described in detail. (AB) (42 refs.).

24626 (NEI-DK–1165) **Durability of fabric filters: Chemical influences. Literature survey. Performance.** Energiministeriets Energiforskningsprogram. Miljoe og restprodukter. Christiansen, K. Dk-TEKNIK, Soeborg (Denmark). Energi og Miljoe. Dec 1991. 64p. (In Danish). Contract ENS-1323/89-8. Order Number DE93794731. Source: OSTI; NTIS.

EFP-89.

Fabric filters used in connection with solid fuel combustion systems often have a very short service life because the bag tears or becomes hard. This could be caused by chemical processes on the surface and within the filter material. These aspects are described and discussed. Also described are specific tests of the fabric's susceptibility to nitrogen oxides and an investigation of hydrolysis of fabric materials. The performance/service life of fabric filters in actual cases of, for example, coal-fired, straw-fired and wood fuelled systems are examined and results are presented in detail. It was found that the most commonly used filter bags in the coal-fired systems observed were made of Dralon-T. Where 1 kg limestone is added per ton of coal these filters will last for two years. Nomex filter bags were most used in straw-fuelled plants and Dralon-T in wood-fuelled plants. Both of these types are composed of felt and last for about one year. Woven filter bags are seldom used because they deteriorate at high temperatures. (AB) (16 refs.).

24627 (NEI-DK–1176) **Methane reduction by catalysts for natural gas motors: Status report.** Boman, H. (Vattenfall Energisystem AB (Sweden)). Nordisk Gasteknisk Center, Hoersholm (Denmark). Mar 1993. 57p. (In Swedish). Order Number DE93794750. Source: OSTI; NTIS.

Methane comprises 80%-90% of the hydrocarbon exhaust emission from natural gas engines. The status of catalysator emission control technology, with the emphasis on methane, is described.

The description is based on a review of relevant literature and contacts with catalysator manufacturers. Excellent performance has been observed for several lean burn and stoichiometric converters but after only a few hours of aging the conversion performance is reduced in the case of most of the catalysts used for methane reduction. Gas engine manufacturers have mainly concentrated on controlling emissions of nitrogen oxides and carbon monoxide. Methane has been neglected in this respect because it does not play a role in ozone formation and because most methane in the atmosphere arises from natural biological sources. Future regulations will determine the extent of research and development within the field of methane reduction by catalysts but, it is stated, if they only control non-methane hydrocarbons, the reduction of methane emissions will probably not be necessary. (AB) (15 refs.).

24628 (NEI-DK–1179) **Integrated energy and environmental analyses.** Juul-Kristensen, B.; Emborg, L. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Fysisk Lab. 3. Jun 1991. 107p. (In Danish). Order Number DE93794744. Source: OSTI; NTIS.

The publication takes the form of a resume and conclusions related to a series of analyses of the coordinated energy and environmental problems experienced in Denmark and the Nordic countries in general. A number of these studies concerned actual methods and tools of analysis. The method was to construct a number of scenarios of the Danish energy system in the year 2010. These were built up in such a way that it would be possible to choose a total energy system which, under specific degrees of social and technological development, satisfied certain environmental goals at the lowest possible cost. On this basis conclusions are made and the suitability of the working methods are discussed. Conclusions mainly concern the feasibility of general strategies for the reduction of carbon dioxide, sulphur dioxide and nitrogen oxides, through energy conservation, pollutive emission reduction and changing from district heating to natural gas cogeneration plants. Economical aspects are emphasised. It is stated that the transport sector contributes a significant amount to air pollution. The discussion is presented in considerable detail. (AB) (25 refs.).

24629 (NEI-FI–202) **Aulanko meeting on models to describe the geographic extent and time evolution of acidification and air pollution damage: Abstracts.** Ministry of the Environment, Helsinki (Finland). 1988. 73p. (CONF-8807220–: Seminar on models to describe the geographic extent and time evolution of acidification and air pollution damage, Haemeenlinna (Finland), 5-8 Jul 1988). Order Number DE93794807. Finnish Research Project on Acidification (HAPRO).

This report contains the proceedings of the meeting on models to describe the geographic extent and time evolution of acidification and air pollution damage. The meeting held is a part of the Finnish Research Project of Acidification, abbreviated as HAPRO: The topics covered include; sensitivity distributions, time evolution of regional impacts and uncertainty in model applications.

24630 (NREL/TP–430-5399) **Mercury emissions from municipal solid waste combustors: An assessment of the current situation in the United States and forecast of future emissions.** National Renewable Energy Lab., Golden, CO (United States); Solid Waste Association of North America, Silver Spring, MD (United States). May 1993. 107p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93000100. Source: OSTI; NTIS; GPO Dep.

This report examines emissions of mercury (Hg) from municipal solid waste (MSW) combustion in the United States (US). It is projected that total annual nationwide MSW combustor emissions of mercury could decrease from about 97 tonnes (1989 baseline uncontrolled emissions) to less than about 4 tonnes in the year 2000. This represents approximately a 95 percent reduction in the amount of mercury emitted from combusted MSW compared to the 1989 mercury emissions baseline. The likelihood that routinely achievable mercury emissions removal efficiencies of about 80 percent or more can be assured; it is estimated that MSW combustors in the US could prove to be a comparatively minor source of mercury emissions after about 1995. This forecast assumes that diligent measures to control mercury emissions, such as via use of supplemental control technologies (e.g., carbon adsorption), are generally employed at that time. However, no present consensus was found that such emissions control measures can be implemented industry-wide in the US within this time frame. Although the availability of technology is apparently not a limiting factor, practical implementation of necessary control technology may be limited by administrative constraints and other considerations (e.g., planning, budgeting, regulatory compliance requirements, etc.). These projections assume that: (a) about 80 percent mercury emissions reduction control efficiency is achieved with air pollution control equipment likely to be employed by that time; (b) most cylinder-shaped mercury-zinc (CSMZ) batteries used in hospital applications can be prevented from being disposed into the MSW stream or are replaced with alternative batteries that do not contain mercury; and (c) either the amount of mercury used in fluorescent lamps is decreased to an industry-wide average of about 27 milligrams of mercury per lamp or extensive diversion from the MSW stream of fluorescent lamps that contain mercury is accomplished.

24631 (ORNL/FTR–4221) **[International Atomic Energy Agency Coordinated Research Program on the Validation of Assessment Model Predictions for urban, aquatic, terrestrial, and multiple pathway systems, and the first technical meeting of the second phase of the International Biospheric Model Validation Study, in Austria]: Foreign trip report, February 28–March 14, 1992.** Barnthouse, L.W.; Blaylock, B.G.; Hoffman, F.O.; Trabalka, J.R. Oak Ridge National Lab., TN (United States). 14 Apr 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011242. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The International Atomic Energy Agency (IAEA) and the International Biospheric Model Validation Study (BIOMOVS) provide an opportunity for scientists around the world to test the validity of assumptions, parameters, and perditions of mathematical models used for environmental radiological assessments. The IAEA has a coordinated research program called the Validation of Assessment Model Predictions which involves model testing in the urban, terrestrial, and aquatic environments. VAMP includes a special working group concerned with testing model predictions of the transfer of radionuclides from an initial deposition through multiple exposure pathways. The travelers actively participated in the VAMP multiple pathways working group; explored opportunities for broadening the scope BIOMOVS II to include nonradiological contaminants and ecological endpoints; and developed collaborative model testing efforts with scientists from eastern Europe and the former Soviet Union.

24632 (ORNL/TM–11212) **Disposal of chemical agents and munitions stored at Umatilla Depot Activity, Hermiston, Oregon: Final Phase 1 environmental report.** Zimmerman, G.P.; Hillsman, E.L.; Johnson, R.O.; Miller, R.L.; Patton, T.G.; Schoepfle, G.M.; Tolbert, V.R.; Feldman, D.L.; Hunsaker, D.B. Jr.; Kroodsma, R.L.; Morrissey, J.; Rickert, L.W.; Staub, W.P.; West, D.C. Oak Ridge National Lab., TN (United States). Feb 1993. 176p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93013452. Source: OSTI; NTIS; GPO Dep.

The Umatilla Depot Activity (UMDA) near Hermiston, Oregon, is one of eight US Army installations in the continental United States where lethal unitary chemical agents and munitions are stored, and where destruction of agents and munitions is proposed under the Chemical Stockpile Disposal Program (CSDP). The chemical agent inventory at UMDA consists of 11.6%, by weight, of the total US stockpile. The destruction of the stockpile is necessary to eliminate the risk to the public from continued storage and to dispose of obsolete and leaking munitions. In 1988 the US Army issued a Final Programmatic Environmental Impact Statement (FPEIS) for the CSDP that identified on-site disposal of agents and munitions as the environmentally preferred alternative (i.e., the alternative with the least potential to cause significant adverse impacts), using a method based on five measures of risk for potential human health and ecosystem/environmental effects; the effectiveness and adequacy of emergency preparedness capabilities also played a key role in the FPEIS selection methodology. In some instances, the FPEIS included generic data and assumptions that were developed to allow a consistent comparison of potential impacts among programmatic alternatives and did not include detailed conditions at

each of the eight installations. The purpose of this Phase 1 report is to examine the proposed implementation of on-site disposal at UMDA in light of more recent and more detailed data than those included in the FPEIS. Specifically, this Phase 1 report is intended to either confirm or reject the validity of on-site disposal for the UMDA stockpile. Using the same computation methods as in the FPEIS, new population data were used to compute potential fatalities from hypothetical disposal accidents. Results indicate that onsite disposal is clearly preferable to either continued storage at UMDA or transportation of the UMDA stockpile to another depot for disposal.

24633 (PNL–3826) **Atmospheric radionuclide concentrations measured by Pacific Northwest Laboratory since 1961.** Young, J.A.; Thomas, C.W. Pacific Northwest Lab., Richland, WA (United States). Mar 1981. 273p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93008062. Source: OSTI; NTIS; GPO Dep.

The atmospheric concentrations of a wide spectrum of radionuclides produced by nuclear weapons, nuclear reactors, cosmic rays, radon and thoron decay and the SNAP-9A burn-up (^{238}Pu) have been measured at Richland, Washington, since 1961; at Barrow, Alaska, since 1964; and at other stations for shorter periods of time. There has been considerable concern over the health hazard presented by these radionuclides, but it has also been recognized that atmospheric mixing and deposition rates can be determined from their measurement. Therefore, Pacific Northwest Laboratory began the continuous measurement of the atmospheric concentrations of a wide spectrum of radionuclides produced by nuclear weapons, nuclear reactors, cosmic rays, and radon and thoron decay. This report will discuss the concentrations of the longer-lived radionuclides (T 1/2 > 12 days). The concentrations of shorter-lived radionuclides measured following Chinese nuclear tests since 1972 are discussed in another report.

24634 (PNL-SA–20914) **A parameterization of cloud droplet nucleation.** Ghan, S.J. (Pacific Northwest Lab., Richland, WA (United States)); Chuang, C.; Penner, J.E. Pacific Northwest Lab., Richland, WA (United States). Jan 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930142–4: 4. American Meteorological Society (AMS) symposium on global change studies, Anaheim, CA (United States), 14-19 Jan 1993). Order Number DE93007998. Source: OSTI; NTIS; INIS; GPO Dep.

Droplet nucleation is a fundamental cloud process. The number of aerosols activated to form cloud droplets influences not only the number of aerosols scavenged by clouds but also the size of the cloud droplets. Cloud droplet size influences the cloud albedo and the conversion of cloud water to precipitation. Global aerosol models are presently being developed with the intention of coupling with global atmospheric circulation models to evaluate the influence of aerosols and aerosol-cloud interactions on climate. If these and other coupled models are to address issues of aerosol-cloud interactions, the droplet nucleation process must be adequately represented. Here we introduce a droplet nucleation parametrization that offers certain advantages over the popular Twomey (1959) parameterization.

24635 (PNL-SA–21377) **Boundary layer structure over areas of heterogeneous heat fluxes.** Doran, J.C. (Pacific Northwest Lab., Richland, WA (United States)); Barnes, F.J.; Coulter, R.L.; Crawford, T.L. Pacific Northwest Lab., Richland, WA (United States). Jan 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830 ;W-31109-ENG-38 ;W-7405-ENG-36. (CONF-930142–5: 4. American Meteorological Society (AMS) symposium on global change studies, Anaheim, CA (United States), 14-19 Jan 1993). Order Number DE93007887. Source: OSTI; NTIS; INIS; GPO Dep.

In general circulation models (GCMs), some properties of a grid element are necessarily considered homogeneous. That is, for each grid volume there is associated a particular combination of boundary layer depth, vertical profiles of wind and temperature, surface fluxes of sensible and latent heat, etc. In reality, all of these quantities may exhibit significant spatial variations the grid area, and the larger the area the greater the likely variations. In balancing the benefits of higher resolution against increased computational time and expense, it is useful to consider what the consequences of such subgrid-scale variability may be. Moreover, in interpreting the results of a simulation, one must be able to define an appropriate average value over a grid. There are two aspects of this latter problem: (1) in observations, how does one take a set of discrete or volume-averaged measurements and relate these to properties of the entire domain, and (2) in computations, how can subgrid-scale features be accounted for in the model parameterizations? To address these and related issues, two field campaigns were carried out near Boardman, Oregon, in June 1991 and 1992. These campaigns were designed to measure the surface fluxes of latent and sensible heat over adjacent areas with strongly contrasting surface types and to measure the response of the boundary layer to those fluxes. This paper discusses some initial findings from those campaigns.

24636 (PNL-SA–21478) **A paleoscience approach to estimating the effects of climatic warming on salmonid fisheries of the Columbia River Basin.** Chatters, J.C.; Butler, V.L.; Scott, M.J.; Anderson, D.M.; Neitzel, D.A. Pacific Northwest Lab., Richland, WA (United States). Oct 1992. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9210326–1: Pacific Science Organization international symposium, Vancouver (Canada), 13-16 Oct 1992). Order Number DE93008991. Source: OSTI; NTIS; GPO Dep.

To understand how climatic warming might affect salmonid populations, we are following a four-step procedure, incorporating paleoenvironmental data at the beginning and ending points, as follows. First, we used geomorphic, paleobotanical, and paleomalacological data to reconstruct stream conditions during the last 8000 years. Second, we estimated the effect on salmon of conditions extant approximately 6000 to 7000 radiocarbon years before present (B.P.), when temperatures were as much as 2°C warmer than at present. This became an analog of future warmer climate and its effects on spawning, incubation, and rearing parameters of the NPPC's Tributary Parameter Model (TPM) for estimating salmoned production. Third, we ran the TPM in conjunction with the NPPC System Planning Model (SPM) to calculate the effect of these analog conditions on the population of returning adult fish in selected stream systems. Ultimately, we will run the models for all salmon-accessible subbasins of the Columbia River system. Finally, we are identifying fish remains obtained from archaeological sites along the Columbia River to compare variations in the taxonomic composition of ancient fish assemblages with model predictions.

24637 (PNL-SA–21486) **Binary homogeneous nucleation: Temperature and relative humidity fluctuations and nonlinearity.** Easter, R.C. (Pacific Northwest Lab., Richland, WA (United States)); Peters, L.K. Pacific Northwest Lab., Richland, WA (United States). Jan 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930133–9: 73. American Meteorological Society (AMS) annual meeting, Anaheim, CA (United States), 17-22 Jan 1993). Order Number DE93007884. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses binary homogeneous nucleation involving H_2SO_4 and water vapor is thought to be the primary mechanism for new particle formation in the marine boundary layer. Temperature, relative humidity, and partial pressure of H_2SO_4 vapor are the most important parameters in fixing the binary homogeneous nucleation rate in the H_2SO_4/H_2O system. The combination of thermodynamic calculations and laboratory experiments indicates that this rate varies roughly as the tenth power of the saturation ratio of H_2SO_4 vapor. Furthermore, the vapor pressure of H_2SO_4 is a function of temperature, and similar dependencies of the binary homogeneous nucleation rate on relative humidity can be noted as well. These factors thus introduce strong non-linearities into the system, and fluctuations of temperature, relative humidity, and H_2SO_4 vapor concentrations about mean values may strongly influence the nucleation rate measured in the atmosphere.

24638 (PNL-SA–21492) **Spatial and temporal variability of precipitation and chemistry: Case studies from the Frontal Boundary Study.** Dana, M.T. Pacific Northwest Lab., Richland, WA (United States). Jan 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930133–10: 73. American Meteorological Society (AMS)

annual meeting, Anaheim, CA (United States), 17-22 Jan 1993). Order Number DE93007883. Source: OSTI; NTIS; INIS; GPO Dep.

Regional and larger-scale models of pollutant transport and deposition generally, by practical necessity, must be limited in output of precipitation rate and chemical composition to values for selected time intervals representing areas on the order of 10^4 km^2. Naturally, it is of some concern that these values be reasonably representative of natural variations both in time and space. This question may be approached through field studies involving detailed spatial (using a network of samplers on the model grid scale) and temporal (using sequential sampling) measurements. This paper presents an initial analysis, using simple statistical concepts, of data bases from such a field study, the Frontal Boundary Study (FBS).

24639 (PNL-SA–21966) **Development of a balloon-borne stabilized platform for measuring radiative flux profiles in the atmospheric boundary layer.** Whiteman, C.D.; Alzheimer, J.M.; Anderson, G.A.; Shaw, W.J. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9303122–2: 3. ARM science team meeting, Norman, OK (United States), 1-5 Mar 1993). Order Number DE93013186. Source: OSTI; NTIS; GPO Dep.

A stabilized platform has been developed to carry broadband short-wave and long-wave radiometric sensors on the tether line of a small tethered balloon that ascends through atmospheric depths of up to 1.5 km to obtain vertical profiles of radiative flux and flux divergence for evaluating atmospheric radiative transfer models. The Sky Platform was designed to keep the radiometers level despite unpredictable movements of the balloon and tether line occasioned by turbulence and wind shear. The automatic control loop drives motors, gears, and pulleys located on two of the vertices of the triangular frame to climb the harness lines to keep the platform level. Radiometric sensors, an electronic compass, and an onboard data acquisition system make up the remainder of the Sky Platform. Because knowledge of the dynamic response of the tether line-platform system is essential to properly close the automatic control loop on the Sky Platform, a Motion Sensing Platform (MSP) was developed to fly in place of the Sky Platform on the tether line to characterize the Sky Platform's operating environment. This unstabilized platform uses an array of nine solid-state linear accelerometers to measure the lateral and angular accelerations, velocities, and displacements that the Sky Platform will experience. This paper presents field performance tests of the Sky and Motion Sensing Platforms, as conducted at Richland, Washington, on February 17, 1993. The tests were performed primarily to characterize the stabilization system on the Sky Platform. Test flights were performed on this cold winter day from 1400 to 1800 Pacific Standard Time (PST). During this period, temperature profiles were near the dry adiabatic lapse rate. Flights were made through a jet wind speed profile having peak wind speeds of 7 m/s at a height of 100 m AGL. Wind directions were from the northwest. All flights were performed as continuous ascents, rather than ascending in discrete steps with halts at set altitudes.

24640 (PNL-SA–22394) **A review of the global emissions, transport, and effects of heavy metals in the environment: Handout.** Friedman, J.R.; Ashton, W.B.; Rapoport, R.D. Pacific Northwest Lab., Richland, WA (United States). May 1993. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93013507. Source: OSTI; NTIS; GPO Dep.

The purpose of this report is to describe the current state of knowledge regarding the sources and quantities of heavy metal emissions, their transport and fate, their potential health and environmental effects, and strategies to control them. The approach is to review the literature on this topic and to consult with experts in the field. Ongoing research activities and research needs are discussed.

24641 (SAND–93-8558C) **A laser-based technique to continuously monitor metal aerosol emissions.** Flower, W.L. (Sandia National Labs., Livermore, CA (United States)); Peng, L.W.; French, N.B.; Johnsen, H.A.; Ottesen, D.K.; Renzi, R.F.: Westbrook, L.V.; Bonin, M.P. Sandia National Labs., Livermore, CA (United States). [1993]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DR00789. (CONF-9305183–1: EPRI workshop, Scottsdale, AZ (United States), 19-22 May 1993). Order Number DE93012836. Source: OSTI; NTIS; INIS; GPO Dep.

Sandia National Laboratories is developing an instrument to continuously monitor metal aerosol emissions. Applications for this monitor range from industrial process vents (e.g., exhaust stacks from electroplating baths) to waste treatment processes (incinerators), to boilers and industrial furnaces (coal-fired power plants). The monitoring technique is based on Laser Spark Spectroscopy (LASS; also known as Laser-Induced Breakdown Spectroscopy – LIBS), in which a pulsed laser is used to rapidly heat a particle and produce a plasma (or laser "spark"). The light emission from the spark is spectrally resolved and analyzed to identify the elemental constituents of the particle and quantify the abundance of the measured species. One feature of LASS is that it can measure atomic species embedded in either solid particles or fine liquid droplets, which account for a large percentage of metal emissions from applications of interest. Presented here are a description of the technique and initial results from laboratory simulations to determine sensitivity and to establish calibration procedures. Our project is currently focused on measuring chromium emissions from electroplating baths. This work forms the basis for future applications to incineration and fossil power plants since chromium is one of the more toxic metals under regulation by the Clean Air Act.

24642 (SCPRI-RM–12-1992) **Monthly results of measurements; December 1992.** Service Central de Protection contre les Rayonnements Ionisants, 78 - Le Vesinet (France). 1992. [62p.] (In French). Order Number DE93625786. Source: OSTI; NTIS (US Sales Only); INIS.

This report of the SCPRI exposes the principal results concerning the routine monitoring of environmental radioactivity in France: atmospheric dusts, rainwater, surface water, underground water, sewage water, drinking water, food chain (milk, vegetables, fishes), sea water around nuclear sites and other sites. The activities of various radioisotopes are presented in tables.

24643 (UCRL-ID–108158) **A modeling perspective on cloud radiative forcing.** Potter, G.L. (Lawrence Livermore National Lab., CA (United States)); Corsetti, L.; Slingo, J.M.; Morcrette, J.J. Lawrence Livermore National Lab., CA (United States). Feb 1993. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (PCMDI–9). Order Number DE93012383. Source: OSTI; NTIS; INIS; GPO Dep.

Radiation fields from a perpetual July integration of a T106 version of the ECM-WF operational model are used to identify the most appropriate way to diagnose cloud radiative forcing in a general circulation model, for the purposes of intercomparison between models. Differences between the Methods I and II of Cess and Potter (1987) and a variant method are addressed. Method I is shown to be the least robust of all methods, due to the potential uncertainties related to persistent cloudiness, length of the sampling period and biases in retrieved clear-sky quantities due to insufficient sampling of the diurnal cycle. Method II is proposed as an unambiguous way to produce consistent radiative diagnostics for intercomparing model results. The impact of the three methods on the derived sensitivities and cloud feedbacks following an imposed change in sea surface temperature is discussed. The sensitivity of the results to horizontal resolution is considered by using the diagnostics from parallel integrations with T21 version of the model.

24644 (UCRL-ID–111532) **AMIP: The Atmospheric Model Intercomparison Project.** Gates, W.L. Lawrence Livermore National Lab., CA (United States). Sep 1992. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93007413. Source: OSTI; NTIS; GPO Dep.

The Atmospheric Model Intercomparison Project (AMIP) is an international effort to determine the systematic climate errors of atmospheric models under realistic conditions, and calls for the simulation of the climate of the decade 1979–1988 using the observed monthly-averaged distributions of sea-surface temperature and sea ice as boundary conditions. Organized by the Working Group on Numerical Experimentation (WGNE) of the World Climate

Resource Programme, AMEP involves the international atmospheric modeling community in a major test and intercomparison of model performance; in addition to an agreed-to set of monthly averaged output variables, each of the participating models will generate a daily history of state. These data will be stored and made available in standard format by the Program for Climate Model Diagnosis and Intercomparison (PCMDI) at the Lawrence Livermore National Laboratory. Following completion of the computational phase of AMEP in 1993, emphasis will shift to a series of diagnostic subprojects, now being formed, for the detailed examination of model performance and the simulation of specific physical processes and phenomena. AMIP offers an unprecedented opportunity for the comprehensive evaluation and validation of current atmospheric models, and is expected to provide valuable information for model improvement.

24645 (UCRL-ID–111532-Rev.1) **AMIP: The Atmospheric Model Intercomparison Project: Program for Climate Model Diagnosis and Intercomparison: Revision 1.** Gates, W.L. Lawrence Livermore National Lab., CA (United States). Dec 1992. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (PCMDI–7). Order Number DE93007400. Source: OSTI; NTIS; GPO Dep.

The Atmospheric Model Intercomparison Project (AMIP) is an international effort to determine the systematic climate errors of atmospheric models under realistic conditions, and calls for the simulation of the climate of the decade 1979–1988 using the observed monthly-averaged distributions of sea-surface temperature and sea ice as boundary conditions. Organized by the Working Group on Numerical Experimentation (WGNF) as a contribution to the World Climate Research Programme, AMIEP involves the international atmospheric modeling community in a major test and intercomparison of model performance; in addition to an agreed-to set of monthly-averaged output variables, each of the participating models will generate a daily history of state. These data will be stored and made available in standard format by the Program for Climate Model Diagnosis and Intercomparison (PCMDI) at the Lawrence Livermore National Laboratory. Following completion of the computational phase of AMIP in 1993, emphasis will shift to a series of diagnostic subprojects, now being planned, for the detailed examination of model performance and the simulation of specific physical processes and phenomena. AMIP offers an unprecedented opportunity for the comprehensive evaluation and validation of current atmospheric models, and is expected to provide valuable information for model improvement.

24646 (UCRL-ID–113623) **Preliminary validation of the low frequency variability of tropospheric temperature and circulation simulated for the AMIP by the ECMWF model.** Boyle, J.S. Lawrence Livermore National Lab., CA (United States). Apr 1993. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (PCMDI–11). Order Number DE93012382. Source: OSTI; NTIS; INIS; GPO Dep.

The ECMWF global model is used to simulate the climate from 1979 to 1988. This integration is in support of the WGNE Atmospheric Model Intercomparison Project (AMIP). The model uses the observed monthly sea surface temperature for the ten year period during the integration. Anomaly correlation and RMS calculations are carried out between monthly mean observed circulation and the model results, although the use of monthly mean clata restricts the conclusions to the low frequency variability. The variables ancl regions considered are the 500 hPa geopotential and MSU temperatures for the Northern Hemisphere (30N to 70N), the 200 hPa zonal wind and MSU temperatures for the equatorial belt (15S to 15N), and the 1000 hPa zonal wind for the equatorial Pacific (15N to 15S ancl 120E to 100W). The results show: (1) For the midlatitude 500 hPa geopotential there is a signal in the model results for the ENSO events of 1982/1983 and 1986/1987; (2) the model underestimates the midlatitude 500 hPa geopotential interannual variability as measured by the RMS but overestimates the MSU temperature variability in this region; (3) in general, outside of the ENSO periods, there is little correlation between the model and observed data anomalies of midlatitude 500 hPa geopotential; (4) in the tropics the variables evince a stronger correlation with observations, with the 200 hPa winds yielding greater agreement than the MSU temperatures and the 1000 hPa zonal wind showing a significant correlation with observations in the interannual variation; (5) in the tropics the model underestimates the variability of the 200 hPa wind and MSU temperature; (6) the model, although non-interacting with the ocean, produces a credible simulation of the low frequency variability of the equatorial JPacific low level zonal wind.

24647 (UCRL-JC–107143) **A fugacity approach for modeling the transport of airborne organic chemicals in an air/plant/soil system.** Oliver, L.D. (North Carolina Univ., Chapel Hill, NC (United States)); McKone, T.E. Lawrence Livermore National Lab., CA (United States). May 1991. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-910659–36: 84. annual meeting and exhibition of the Air and Waste Management Association (AWMA), Vancouver (Canada), 16-21 Jun 1991). Order Number DE93009283. Source: OSTI; NTIS; INIS; GPO Dep.

An important issue facing both public and private agencies is the identification and quantification of exposures by indirect pathways to toxic chemicals released to the atmosphere. With recent public concerns over pesticides such as malathion and alar in foods, greater attention is being given to the process of chemical uptake by plants. Whether chemicals taken up by plants can accumulate and ultimately enter the human food chain are important questions for determining health risks and safe levels of toxic air-pollutant emissions and pesticide application. A number of plant-toxicokinetic, or "botanicokinetic," models have been developed to give estimates of how chemicals are partitioned and transported within plants. In this paper, we provide a brief review of these models, describing their main features and listing some of their advantages and disadvantages. We then describe and demonstrate a five-compartment air/plant/soil model, which builds on and extends the features included in previous models. We apply this model to the steady-state chemical partitioning of perchloroethylene, hexachlorobenzene, and 2,3,7,8-tetrachlorodibenzo-p-dioxin in grass as test cases. We conclude with a discussion of the advantages and limitations of the model.

24648 (UCRL-JC–108020) **Cloud radiative forcing: A modeling perspective.** Potter, G.L. (Lawrence Livermore National Lab., CA (United States)); Slingo, J.M.; Morcrette, J.J. Lawrence Livermore National Lab., CA (United States). May 1991. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9105202–9: 1. energy research power supercomputer users symposium, Gaithersburg, MD (United States), 21-22 May 1991). Order Number DE93009296. Source: OSTI; NTIS; GPO Dep.

Radiation fields from a perpetual July integration of a high resolution version of the ECMWF operational model are used as surrogate observations of the radiation budget at the top of the atmosphere, to illustrate various difficulties that modelers might face when trying to reconcile cloud radiative forcings derived from satellite observations with those generated by models. Differences between the so-called Methods I and II of Cess and Potter are addressed. Method I is shown to be the least robust of all methods, due to the potential uncertainties related to persistent cloudiness, length of the sampling period, and biases in retrieved clear-sky quantities due to insufficient sampling of the diurnal cycle.

24649 (UCRL-JC–108523) **Towards the development of a global inventory for black carbon emissions.** Penner, J.E. (Lawrence Livermore National Lab., CA (United States)); Eddleman, H.; Novakov, T. Lawrence Livermore National Lab., CA (United States). Oct 1991. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9104368–1-Rev.1: 4. international conference on carbonaceous particles in the atmosphere, Vienna (Austria), 3-5 Apr 1991). Order Number DE93014114. Source: OSTI; NTIS; INIS; GPO Dep.

The authors have developed a global inventory for black carbon (BC) emi measured ambient concentration ratios of black carbon and SO_2 at locations throughout the world. They have extended the data base for black carbon by using "smoke" measurements at a variety of monitoring sites and a calibration factor for black carbon derived herein from ambient "smoke" and BC measurements. They demonstrate that BC to SO_2 ratios are well correlated at

most sites and that distinct ratios of BC to SO_2 apply to source areas from economically distinct regions. However, within any one economic region, the ratio of BC to SO_2 appears to be relatively constant. These facts are used to construct a global inventory of black carbon emissions by using previously published inventories for the emissions of sulfur from fossil fuel use. The derived inventory totals nearly 24 Tg C/yr. This inventory is compared to a crude inventory based on emission factors and published fuel use statistics for wood and bagasse burning, diesel fuel, and domestic and commercial coal use. The combined emissions from wood, diesel, and coal can explain more than 75% of the total global emissions and usually are within a factor of two of the derived regional emissions from the BC/S ratio method. The black carbon inventory, totaling nearly 24 Tg C/yr, is used in the Lawrence Livermore National Laboratory global chemistry/climate model to simulate the world-wide distribution of black carbon. The predicted concentrations are compared with available measurements from throughout the world. This comparison supports the magnitude of the inventory which the authors have derived to within a factor of two, although significant uncertainties with respect to the treatment of scavenging and deposition in the model remain.

24650 (UCRL-JC–108641) **Application of the Ames/ Salmonella assay to routine industrial hygiene work.** Miller, G.C.; Avila, J.; Elliott, J.; Felton, J.; Nielson, J. Lawrence Livermore National Lab., CA (United States). May 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9205215–3: American industrial hygiene conference and exposition, Boston, MA (United States), 30 May - 5 jun 1992). Order Number DE93009526. Source: OSTI; NTIS; GPO Dep.

We have used the Ames/Salmonella assay aggressively for swipe-testing surfaces and for sampling the air people breathe. Our technique for air sampling particulates and subsequently analyzing them using a simple gravimetric assay and the Ames/Salmonella (or other biological) assay is discussed herein. We also discuss some recent applications of the assay to test for mutagenic materials on surfaces and in the air at Lawrence Livermore National Laboratory (LLNL).

24651 (UCRL-JC–108847) **Two dimensional model study of atmospheric transport using carbon-14 and strontium-90 as inert tracers.** Kinnison, D.E. (Lawrence Livermore National Lab., CA (United States)); Wuebbles, D.J.; Johnston, H.S. Lawrence Livermore National Lab., CA (United States). Feb 1992. 44p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-7405-ENG-48 ;AC03-76SF00098. (CONF-9202172–1: NASA high speed research program models and measurements workshop, Satellite Beach, FL (United States), 2-7 Feb 1992). Order Number DE93012547. Source: OSTI; NTIS; INIS; GPO Dep.

This study tests the transport processes in the LLNL two-dimensional chemical-radiative-transport model using recently reanalyzed carbon-14 and strontium-90 data. These radioactive tracers were produced bythe atmospheric nuclear bomb tests of 1952–58 and 1961–62, and they were measured at a few latitudes up to 35 kilometers over the period 1955–1970. Selected horizontal and vertical eddy diffusion coefficients were varied in the model to test their sensitivity to short and long term transpose of carbon-14. A sharp transition of K_{zz} and K_{yy} through the tropopause, as opposed to a slow transition between the same limiting values, shows a distinct improvement in the calculated carbon-14 distributions, a distinct improvement in the calculated seasonal and latitudinal distribution of ozone columns (relative to TOMS observations), and a very large difference in the calculated ozone reduction by a possible fleet of High Speed Civil Transports. Calculated northern hemisphere carbon-14 is more sensitive to variation of K_{yy} than are global ozone columns. Strontium-90 was used to test the LLNL tropopause height at four different latitudes. Starting with the 1960 background distribution of carbon-14, we calculate the input of carbon-14 as the sum of each nuclear test of the 1961–62 series, using two bomb-cloud rise models. With the Seitz bomb-rise formulation in the LLNL model, we find good agreement between calculated and observedcarbon-14 (with noticeable exceptions at the north polar tropopause and the short-term mid-latitude mid-stratosphere) between 1963 and 1970.

24652 (UCRL-JC–109822) **Coupled ocean-atmosphere GCM simulation of Southern Oscillation phenomena.** Sperber, K.R. (Lawrence Livermore National Lab., CA (United States)); Hameed, S. Lawrence Livermore National Lab., CA (United States). Jul 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9209331–2: 7. Brazilian Meteorological Congress: climate change and the environment, Sao Paulo (Brazil), 28 Sep - 2 oct 1992). Order Number DE93012583. Source: OSTI; NTIS; GPO Dep.

The Oregon State University coupled upper ocean-atmosphere GCM has, been shown to qualitatively simulate the Southern Oscillation. A composite analysis of the warm and cold events simulated in this 23-year integration has been performed. During the low phase of the SO, when warm anomalies occur in the Eastern Pacific the model simulates for the Atlantic region during March–May (1) a deficit of precipitation over the tropical South American continent (2) Caribbean and Gulf of Mexico sea-level pressure and sea-surface temperature are in-phase with the Eastern Pacific anomalies, while those East of the Nordeste region are out-of-phase (3) northeast trade winds are anomalously weak and southwest trade winds are anomalously strong (as inferred from surface current anomalies). During the high phase of the simulated Southern Oscillation conditions in the atmosphere and ocean are essentially the reverse of the low phase. Thus the model produces a response in the South American region during the opposing phases of the Southern Oscillation which is in general agreement with observations.

24653 (UCRL-JC–110400) **The cloud radiative feedback of a midlatitude squall line system and implication for climate study.** Chin, H.N.S. Lawrence Livermore National Lab., CA (United States). 1 May 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920881–2: 11. international conference on clouds and precipitation, Montreal (Canada), 17-21 Aug 1992). Order Number DE93010511. Source: OSTI; NTIS; INIS; GPO Dep.

The main objectives of this study are (1) to study the impact of longwave and shortwave radiation on the thermodynamic and kinematic structure of a midlatitude squall line; and (2) to explore the influence of specifically including the ice phase in the cloud-radiation feedback mechanism for climate models.

24654 (UCRL-JC–110558) **A self-consistent model of nonlinear parameterization of turbulent diffusion in atmospheric boundary layer.** Gavrilov, V.P. (Institut Eksperimental'noj Meteorologii, Obninsk (Russian Federation)); Klepikova, N.V.; Rodean, H.C.; Gudiksen, P.H. Lawrence Livermore National Lab., CA (United States). Nov 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9209158–12: 10. symposium on turbulence and diffusion, Portland, OR (United States), 29 Sep - 2 oct 1992). Order Number DE93011950. Source: OSTI; NTIS; INIS; GPO Dep.

The paper presents a self-consistent model for pollutant dispersal in the atmosphere in which coefficients of turbulent diffusion are determined through concentration distribution function. Boundary and initial conditions with consideration for real meteorological information and real conditions of dispersal relate fieid measurements to concentration distribution function and correspondingly to diffusion coefficient.

24655 (UCRL-JC–110844) **Integration of measurements with atmospheric dispersion models: Source term estimation for dispersal of ^{239}Pu due to non- nuclear detonation of high explosive.** Edwards, L.L. (Lawrence Livermore National Lab., CA (United States)); Harvey, T.F.; Freis, R.P.; Pitovranov, S.E.; Chernokozhin, E.V. Lawrence Livermore National Lab., CA (United States). Oct 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921040–1: 3. international workshop on real-time computing of the environmental consequences of an accidental release to atmosphere from a nuclear installation: decision-making support for offsite emergency management installation, Klais (Germany), Order Number DE93012550. Source: OSTI; NTIS; INIS; GPO Dep.

The accuracy associated with assessing the environmental consequences of an accidental release of radioactivity is highly dependent on our knowledge of the source term characteristics and, in the case when the radioactivity is condensed on particles, the particle size distribution, all of which are generally poorly known. This paper reports on the development of a numerical technique that integrates the radiological measurements with atmospheric dispersion modeling. This results in a more accurate particle-size distribution and particle injection height estimation when compared with measurements of high explosive dispersal of ^{239}Pu. The estimation model is based on a non-linear least squares regression scheme coupled with the ARAC three-dimensional atmospheric dispersion models. The viability of the approach is evaluated by estimation of ADPIC model input parameters such as the ADPIC particle size mean aerodynamic diameter, the geometric standard deviation, and largest size. Additionally we estimate an optimal "coupling coefficient" between the particles and an explosive cloud rise model. The experimental data are taken from the Clean Slate 1 field experiment conducted during 1963 at the Tonopah Test Range in Nevada. The regression technique optimizes the agreement between the measured and model predicted concentrations of ^{239}Pu by varying the model input parameters within their respective ranges of uncertainties. The technique generally estimated the measured concentrations within a factor of 1.5, with the worst estimate being within a factor of 5, very good in view of the complexity of the concentration measurements, the uncertainties associated with the meteorological data, and the limitations of the models. The best fit also suggest a smaller mean diameter and a smaller geometric standard deviation on the particle size as well as a slightly weaker particle to cloud coupling than previously reported.

24656 (UCRL-JC–110846) **Comments on possible causes of recent global warming.** Duffy, P.B. Lawrence Livermore National Lab., CA (United States). 24 Sep 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9201148–1: 73. American Meteorological Society (AMS) meeting, Anaheim, CA (United States), 17-22 Jan 1992). Order Number DE93010501. Source: OSTI; NTIS; INIS; GPO Dep.

The researcher shows that recent global temperature changes cannot be due to solar luminosity variations coincident with changes in solar cycle amplitudes, since this would violate causality. In addition, a related suggestion using solar cycle lengths instead of amplitudes appears highly unlikely, since time lags between changes in the cycle lengths and observed temperatures are very different from those calculated with a climate model. Finally, lag correlations between historical land and sea temperates indicate that ocean temperatures follow land temperatures by 15 or 20 yr. This means that the oceans' response time must be at least this long, if these temperature changes are due to some change in external forcing. It also suggests that this is in fact the case, since "natural" climate variations might well entail SSTs changing before LATs, which is not observed.

24657 (UCRL-JC–110922) **The role of human activity and land use change in atmospheric chemistry and air quality.** Penner, J.E. Lawrence Livermore National Lab., CA (United States). Jul 1992. 45p. Sponsored by USDOE, Washington, DC (United States); Environmental Protection Agency, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract W-7405-ENG-48. DW89932676-01-0;NAGW-1827. (CONF-9107235–1: SNOWMASS meeting, Denver, CO (United States), 21 Jul - 10 aug 1991). Order Number DE93011871. Source: OSTI; NTIS; INIS; GPO Dep.

In the this paper, I review the importance of a mineral of fossil fuel emissions atmospheric chemistry, air quality, and climate. I then review current estimates of the sources for each specie, deriving the fraction of each source that is due to specific land use practices or land cover categories. Understanding the current trends of those species with known increasing abundances and projecting increases into the future is possible if the estimated sources from human activity and land use change can be projected and if the known atmospheric sinks and the interactions in atmospheric chemistry and climate change are appropriately taken into account. Regional trends in the short-lived species can be projected as well, assuming the estimated sources and sinks are correct. However, significant uncertainties continue to surround the estimated budgets for most of these species. Uncertainties and the estimated ranges in different source strength estimates for each are also discussed.

24658 (ANL/ER/CP–77595) **Site characterization for the in situ bioremediation of the vadose zone.** Montemagno, C.D. (Argonne National Lab., IL (United States)); Leo, A.; Craig, J. Argonne National Lab., IL (United States). [1993]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930585–2: 2. USA/CIS joint conference on environmental hydrology and hydrogeology, Washington, DC (United States), 16-29 May 1993). Order Number DE93010665. Source: OSTI; NTIS; INIS; GPO Dep.

Studies were conducted to determine whether bioremediation can be used to treat a diesel fuel spill in the deep vadose zone (>30 m). After laboratory studies confirmed the ability of the natural population of organisms to degrade the diesel fuel, the technological issue of transporting the required mass of nutrients to the contaminated soils was addressed. Laboratory studies demonstrated that nutrient and oxygen transport can be enhanced by the addition of divalent cations to injected waters. This addition of minerals caused the observed hydraulic conductivity to be maintained at elevated levels that allowed the macronutrient nitrogen, provided as ammonium ion, to be more uniformly distributed to target soil domains.

24659 (ANL/ES/CP–78514) **Separation of heavy metals: Removal from industrial wastewaters and contaminated soil.** Peters, R.W.; Shem, L. Argonne National Lab., IL (United States). Energy Systems Div. [1993]. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9303107–1: International conference on emerging separation technologies for metals and fuels, Palm Coast, FL (United States), 13-28 Mar 1993). Order Number DE93008657. Source: OSTI; NTIS; GPO Dep.

This paper reviews the applicable separation technologies relating to removal of heavy metals from solution and from soils in order to present the state-of-the-art in the field. Each technology is briefly described and typical operating conditions and technology performance are presented. Technologies described include chemical precipitation (including hydroxide, carbonate, or sulfide reagents), coagulation/flocculation, ion exchange, solvent extraction, extraction with chelating agents, complexation, electrochemical operation, cementation, membrane operations, evaporation, adsorption, solidification/stabilization, and vitrification. Several case histories are described, with a focus on waste reduction techniques and remediation of lead-contaminated soils. The paper concludes with a short discussion of important research needs in the field.

24660 (ANL/ESD/TM–42) **Geophysics: Building E5440 decommissioning, Aberdeen Proving Ground: Interim progress report.** McGinnis, L.D.; Miller, S.F.; Thompson, M.D.; McGinnis, M.G. Argonne National Lab., IL (United States). Energy Systems Div. Nov 1992. 35p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93009086. Source: OSTI; NTIS; GPO Dep.

Building E5440 was one of ten potentially contaminated sites in the Canal Creek and Westwood areas of the Edgewood section of Aberdeen Proving Ground examined by a geophysical team from Argonne National Laboratory in April and May 1992. Noninvasive geophysical surveys, including magnetics, electrical resistivity, and ground-penetrating radar (GPR), were conducted around the

perimeter of the building to guide a sampling program prior to decommissioning and dismantling. The results show several complex geophysical signatures. Isolated, one-point, magnetic anomalies surrounding the building may be associated with construction fill. A 10-ft-wide band of strongly magnetic positive anomalies bordering the north side of the building obliterates small magnetic sources that might otherwise be seen. A prominent magnetic "nose" extending northward from this band toward a standpipe at 100N,63E may be connected to an underground tank. The southeast corner of the site is underlain by a rectangular, magnetized source associated with strong radar images. A magnetic lineament extending south from the anomaly may be caused by a buried pipe; the anomaly itself may be caused by subsurface equipment associated with a manhole or utility access pit. A 2,500-gamma, positive magnetic anomaly centered at 0N,20E, which is also the location of a 12 Ω-m resistivity minimum, may be caused by a buried vault. It appears on radar imaging as a strong reflector.

Argonne National Lab., IL (United States). Energy Systems Div. Nov 1992. 33p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93011641. Source: OSTI; NTIS; INIS; GPO Dep.

Building E5476 was one of ten potentially contaminated sites in the Canal Creek and Westwood areas of the Edgewood section of Aberdeen Proving Ground examined by a geophysical team from Argonne National Laboratory in April and May of 1992. Noninvasive geophysical surveys, including magnetics, electrical resistivity, and ground-penetrating radar, were conducted around the perimeter of the building to guide a sampling program prior to decommissioning and dismantling. The large number of magnetic sources surrounding the building are believed to be contained in construction fill. The smaller anomalies, for the most part, were not imaged with ground radar or by electrical profiling. Large magnetic anomalies near the southwest comer of the building are due to aboveground standpipes and steel-reinforced concrete. Two high-resistivity areas, one projecting northeast from the building and another south of the original structure, may indicate the presence of organic pore fluids in the subsurface. A conductive lineament protruding from the south wall that is enclosed by the southern, high-resistivity feature is not associated with an equivalent magnetic anomaly. Magnetic and electrical anomalies south of the old landfill boundary are probably not associated with the building. The boundary is marked by a band of magnetic anomalies and a conductive zone trending northwest to southeast. The cause of high resistivities in a semicircular area in the southwest comer, within the landfill area, is unexplained.

24662 (ANL/ESD/TM–44) **Geophysics: Building E5481 decommissioning, Aberdeen Proving Ground: Interim progress report.** Thompson, M.D.; McGinnis, M.G.; McGinnis, L.D.; Miller, S.F. Argonne National Lab., IL (United States). Energy Systems Div. Nov 1992. 33p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93011754. Source: OSTI; NTIS; INIS; GPO Dep.

Building E5481 is one of ten potentially contaminated sites in the Canal Creek and Westwood areas of the Edgewood section of Aberdeen Proving Ground examined by a geophysical team from Argonne National Laboratory in April and May of 1992. Noninvasive geophysical surveys, including magnetics, electrical resistivity, and ground-penetrating radar, were conducted around the perimeter of the building to guide a sampling program prior to decommissioning and dismantling. The building is located on the northern margin of a landfill that was sited in a wetland. The large number of magnetic sources surrounding the building are believed to be contained in construction fill that had been used to raise the grade. The smaller anomalies, for the most part, are not imaged with ground radar or by electrical profiling. A conductive zone trending northwest to southeast across the site is spatially related to an old roadbed. Higher resistivity areas in the northeast and east are probably representive of background values. Three high-amplitude, positive, rectangular magnetic anomalies have unknown sources. The features do not have equivalent electrical signatures, nor are they seen with radar imaging.

24663 (BNL–48451) **A multilayer groundwater sampler for characterizing contaminant plumes: Final report.** Kaplan, E.; Heiser, J. Brookhaven National Lab., Upton, NY (United States). 18 Dec 1992. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93010935. Source: OSTI; NTIS; INIS; GPO Dep.

This final report describes activities related to the design and initial demonstration of a passive multilayer groundwater sampling system. The apparatus consists of remotely controlled cylinders filled with deionized water which are connected in tandem. Vertical fine structure of contaminants are easily defined. Using the apparatus in several wells may lead to three dimensional depictions of groundwater contamination, thereby providing the information necessary for site characterization and remediation.

24664 (BNL–48908) **Non-invasive multilevel groundwater samplers.** Kaplan, E.; Heiser, J. Brookhaven National Lab., Upton, NY (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930769–4: 1993 joint Canadian Society of Civil Engineers-American Society of Civil Engineers (CSCE-ASCE) national conference on environmental engineering, Montreal (Canada), 12-14 Jul 1993). Order Number DE93013398. Source: OSTI; NTIS; INIS; GPO Dep.

Two non-intrusive, passive multilayer groundwater sampling devices are described which collect data simultaneously at small vertical intervals in the same well, without disturbing the geohydrological environment. One system uses membranes, the other uses remotely operated stainless steel cylinders connected in tandem. When used in several wells sufficient information is collected to allow a three dimensional characterization of contaminants and flow in the aquifer. The systems were used during field trials at Savannah River Laboratory in November 1991 and June 1992, and collected water quality and flow data over a 3 meter interval below the water table in each of two wells. Data from 1991 indicate weak vertical profiles in temperature, dissolved oxygen, and pH over the 3 m sampling interval. Other measurements indicated a relatively uniform horizontal specific discharge of about 6 cm/year over the same sampling interval. No statistically significant vertical structure was evident for discharge. This presentation will compare this information with data obtained from field trials in June 1992.

24665 (BNL–70254) **[Experiments on CO_2 enrichment]: Foreign travel trip report, 22–31 October 1992.** Hendrey, G.R. Brookhaven National Lab., Upton, NY (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93008789. Source: OSTI; NTIS (US Sales Only); GPO Dep.

George Hendrey was invited to present seminars in Zurich, Switzerland, to discuss collaboration in research with groups in Switzerland and Germany, to visit laboratories and field research sites in Germany and to participate in the CO_2 Workshop on Design and Execution Experiments on CO_2 Enrichment in Germany. Hendrey will collaborate in setting up Free-Air CO_2 Enrichment field facilities in these two countries. Recommendation were made concerning development of the two FACE field sites. The Workshop, sponsored by IGBP, reviewed advantages and disadvantages of various controlled environments, field chambers and FACE with respect to studies of CO_2 enrichment at the whole ecosystem level. IGBP strongly endorses FACE experiments and will encourage formation of networks of field research efforts.

24666 (CFS/OO–46-13/35-1991E, pp. 21-28) **Acidic atmospheric deposition in eastern North America: Forest resources at risk.** Krause, H.H. (New Brunswick Univ., Fredericton, NB (Canada)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Acidic deposition above natural levels occurs over most of the North American continent east of the 100°W meridian. With an annual growth of ca 475 million m^3 of wood in the United States and 146 million m^3 in Canada, the forests of affected areas contribute significantly to the economies of both countries, but especially in Canada where one in ten jobs is dependent on forestry. In the U.S., ca 10% of the annual forest growth occurs in areas subjected to very heavy acidic deposition, and more than 75% in areas of heavy and moderate deposition. Among the forest ecosystems within the zone of very heavy deposition are sensitive combinations of conifer cover and low buffering capacity soils. In Canada, ca 53% of annual growth is within the zone of light deposition, 43% in zones of moderate and heavy deposition, and only 4% in zones with very heavy deposition. However, unlike the U.S., most of the growth is in regions with coniferous or mixed-growth forests on soils with low buffering capacity and a susceptibility to aluminum toxicity. Besides possible effects on the fibre-producing ability of forests, acidic deposition may indirectly affect terrestrial wildlife and aquatic habitats. Whereas information is still inconclusive with respect to forest productivity and terrestrial wildlife, adverse effects of acidic deposition, at present levels, have been proved for aquatic habitats, and a danger now exists for areas with soils and bedrock of low buffering capacity. 26 refs., 1 fig.

24667 (CFS/OO–46-13/35-1991E, pp. 35-54) **Wet deposition to forests.** Summers, P.W. (Atmospheric Environment Service, Environment Canada, Downsview, ON (Canada)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

The phenomena of wet deposition is discussed within the context of the observed global distribution of precipitation chemistry and atmospheric processes. It is related to the natural and anthropogenic sources of predominating chemical species. The development of sampling techniques and observing networks is summarized, and the important considerations of sampler location, time resolution, continuity of records and sources of error are discussed. The main emphasis is on regions of heavy wet deposition, caused by man-made sources in eastern North America and Europe. Both spatial and temporal variations of deposition for the major ions (H^+, SO_4^{2-}, NO_3^-, Ca^{2+}, Mg^{2+}) and heavy metals (Pb, Cd, Cu, V, etc.) are presented. The relationship between deposition patterns, meteorological and climatic factors and forest distribution is compared and contrasted between North America and Europe, in terms of events (short episodes of highly acidic deposition), seasonal variations (with special attention to snowpack accumulation) and longer term trends. Finally, the significance of a recently recognized form of wet deposition by fog and low cloud, especially on elevated forests, is discussed. 22 refs., 8 figs., 3 tabs.

24668 (CFS/OO–46-13/35-1991E, pp. 55-94) **Dry deposition and ambient concentrations.** Neumann, H.H. (Atmospheric Environment Services, Environment Canada, Downsview, ON (Canada)); Hartog, G. den; Bussieres, N. Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

The role of dry deposition in the acid rain problem is examined, particularly with regard to forests of northeastern North America. Available data on ambient concentrations of the relevant atmospheric pollutants are reviewed and related qualitatively to the distribution of emission sources and to the prevailing meteorology. Cyclic seasonal and diurnal variations in concentrations are discussed, as well as the episodic nature of high pollution events. Techniques for estimating dry deposition are briefly described. These include mass balance methods, dryfall collectors and surrogate surfaces, micrometeorological flux measurements, and methods of estimating deposition from ambient concentration. The concept of a deposition velocity is considered in relation to the familiar resistance analogue for atmospheric fluxes within the surface layer. The dependence of deposition velocity on atmospheric parameters and surface characteristics is noted. Finally, some estimates of dry deposition are presented. Results for particular experiments are given, as well as generalized regional patterns derived from the mean concentration fields. Direct measurements of deposition to forests have been relatively rare and so considerable uncertainty remains as to actual deposition rates to forests, especially for particulate deposition. 36 refs., 23 figs., 2 tabs.

24669 (CFS/OO–46-13/35-1991E, pp. 193-206) **The nature, forms and transformations of sulphur in soils.** Stewart, J.W.B. (Saskatchewan Inst. of Pedology, Saskatchewan Univ., Saskatoon, SK (Canada)); Bettany, J.R. Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

The importance of sulfur as an atmospheric pollutant and as an essential nutrient and the increasing occurrence of S deficiency around the world have emphasized the need to obtain an understanding of the nature, form and transformation of S in soils. In particular, although most soil S exists in combination with organic matter, the biological availability of S has only been quantified in a few areas and very rarely in soils receiving significant amounts of exogenous inorganic sulfate. Some of the process studies that have helped elucidate the S cycle dynamics are reviewed, and the possibility and probability of similar processes being active in forest soils are discussed. Information on S transformation processes are reviewed and related to changes that could occur with the addition of extra S in acid rain. Four distinct microbial processes work to transform S in soils: mineralization, immobilization, oxidation, and reduction. Data are presented on carbon, nitrogen and sulfur ratios of world soil types, including effect of parent material, effect of weathering, and effect of climate and cultivation. 52 refs., 1 fig., 1 tab.

24670 (CFS/OO–46-13/35-1991E, pp. 133-152) **Recent changes in the growth of the forest trees in the northeastern United States.** Johnson, A.H. (Pennsylvania Univ., Philadelphia, PA (United States)); Siccama, T.G.; Friedland A.J. Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

The extent and nature of growth changes in pines and spruce were studied to investigate the effects of acid rain on these species. Increment cores from Picea rubens Sarg. in the montane boreal forests of New York, Vermont and New Hampshire show a clear and substantial reduction in growth which began in the early to mid-1960s and preceded a general decline of that species in the high elevation forests of the northeast. In the sandy soils of southern New Jersey, Pinus rigida Mill. and Pinus echinata Mill. show a very similar decline in increment size beginning in the late 1950s. The decreased growth effect is, in each case, widespread, substantial and sustained through to the present, and suggests substantial physiological impairment. The timing of the shift to abnormally slow growth suggests that it is an after-effect of drought stress. Although there are many pathways by which pollutant stress (including acid deposition-induced stress) could contribute to stress in forests, there is currently no evidence which clearly links pollution stress to the observed changes in growth. 29 refs., 10 figs., 1 tab.

24671 (CFS/OO–46-13/35-1991E, pp. 177-186) **Acid rain and the buffer capacity of forest soils.** Hornbeck, J.W. (United States Dept. of Agriculture Forest Services, Durham, NH (United States)); Federer, C.A. Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Past reviews of the effects of acid rain on soil nutrients suggest five major concerns: increased leaching losses; reduction in cation exchange capacity; accelerated weathering of soil minerals; mobilization of toxic elements; and changes in soil biota. These effects assume that acid precipitation accelerated soil acidification. The capacity of forest soils to buffer H^+ in precipitation was studied by adding H^+ and OH^- to soil samples from forested sites in Maine, New Hampshire and Connecticut. The change in pH for a unit addition of H^+ or OH^- is nearly independent of pH for these soils. Buffer capacity ranged from 5 to 15 mmol(H^+)/kg/pH in the mineral soils, and from 20 to 100 mmol(H^+)/kg/pH in forest floors. The buffer capacity was closely related organic content. In a worst case situation, in which mitigating factors are neglected, the buffer capacity values indicate that a change in pH of one unit in the forest floor would require an addition of only 2-10 kmol(H^+)/ha while a change of one unit in the mineral soil would require 30-50 kmol(H^+)/ha. These data suggest that forest soils may not be as effective as a buffer as has previously been thought. 20 refs., 1 fig., 3 tabs.

24672 (CFS/OO–46-13/35-1991E, pp. 187-192) **Solubility and mobility of aluminum by acidification of soils.** Singh, S.S. (Chemistry and Biology Research Inst., Agriculture Canada, Ottawa, ON (Canada)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Soils are complex dynamic systems which occur as products of processes of soil formation and weathering. Acid precipitation is one of many components which have been added to soils by intensified economic activity. Aluminum is not a major component of acidic precipitations, however the concentration of Al in soil solution is pH dependent. Aluminum exists in soil in a number of solid and solution forms. The soluble forms of aluminum are controlled by the pH and the anion association. Aluminum hydrolyzes readily, and anions associated with Al have an effect on hydrolysis. The formation of soluble complexes of Al, such as $AlSO_4^+$, influences many reactions. A comparison of soil chemistry of Al in the presence of Cl and SO_4^{2-} ions shows significant differences in the distribution of aluminum species. In the presence of SO_4^{2-} ions, a substantial amount of aluminum exists as monovalent $AlSO_4^+$, which is not as effective as trivalent aluminum in competing with basic cations for occupying exchange sites. Thus, in SO_4^{2-} systems, a substantial amount of Al is present in a form which can easily move in the soil profile or can leach out of the soil profile to the aquatic environment. The ratio of $AlSO_4^+$ to Al^{3+} is controlled by the activity of SO_4^{2-} ions. A 10-fold change in SO_4^{2-} results in a 10-fold change in this ratio. On leaching of $AlSO_4^{2+}$ ions from soil systems to aquatic systems, dilution effects would effectively revert the $AlSO_4^+$ ions to Al^{3+} ions.

24673 (CFS/OO–46-13/35-1991E, pp. 209-229) **Acid rain effects on nitrogen availability from litter and organic matter decomposition.** Mahendrappa, M.K. (Canadian Forestry Service, Fredericton, NB (Canada)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

The combined effects of various nitrogen transformation processes in soil in relation to the nature of the plants or trees have to be taken into consideration in evaluating the availability of nitrogen in any ecosystem. The same edaphic factors that affect plant growth also influence nitrogen transformation processes and ecological stability. Litter decomposition and organic matter turnover are also integral parts of the cycle that limits nitrogen availability to trees. Normal growth and development of forest stands, therefore, depend on the continuity of all the inter-related processes that influence nitrogen availability. Acidification of forest ecosystems from external sources can affect chemical and biological nitrogen transformation processes within trees, in the soil, and also in the atmosphere. Data on nitrogen availability in acidified forest ecosystems indicate both favourable and deleterious effects of acidification. 92 refs., 5 figs., 1 tab.

24674 (CFS/OO–46-13/35-1991E, pp. 232-248) **Evolution of forest soils of Quebec under acid pH conditions.** Kimpe, C.R. de (Agriculture Canada, Ste-Foy, PQ (Canada)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

The large variety of Podzolic soils in Quebec, as illustrated by some typical profiles, depends on the nature of the parent material. The principal mechanisms responsible for the translocation of Al^{3+} cations released from primary minerals by protons are reviewed. The first mechanism involves the formation of organometallic complexes, but it cannot satisfactorily explain the formation of all types of Podzolic soils. The second mechanism considers that mineral aluminosilicate complexes, such as protoimogolite, are the main factors able to transport Al^{3+} down the profile. Dissolution of primary minerals and their transformation into secondary minerals, as well as the further evolution of secondary minerals, are largely dependent on the leaching of M^+ and M^{2-} cations and on the final Al_2O_3/SiO_2 molar ratio. Podzilic soils in Quebec still contain a large supply of cations, yet their ability to neutralize H^+ ions is determined by the availability of these cations and by the residence time of the percolating water. In the soils developed on till, saturated hydraulic conductivity is higher in the solum than in the parent material, and the solum is more depleted of cations. Some relationships between soil properties and H^+ neutralization are discussed. 36 refs., 5 figs., 3 tabs.

24675 (CFS/OO–46-13/35-1991E, pp. 251-265) **Acid deposition and element cycling in eastern North American forests.** Foster, N.W. (Canadian Forestry Service, Sault Ste-Marie, ON (Canada)); Nicolson, J.A.; Morrison, I.K. Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Current knowledge of the relationship between atmospheric deposition of acids and acid-forming substances on the one hand and element fluxes on the other in major eastern North American forest types is reviewed. A mature tolerant hardwood forest on a well-drained acid till soil at Turkey Lakes Watershed in northern Ontario serves as a point of reference. Nitrogen and sulfur fluxes between element pools within the ecosystem are emphasized because of the association of N and S forms with acid pollution. Nitrogen turnover (ca 45 kg/ha/y) in the reference forest ecosystem is much greater than atmospheric N input (ca 12 kg/ha/y) and streamflow N output (ca 7 kg/ha/y). Thus, a tight cycle of N is maintained in this undisturbed old-growth hardwood forest. Input/output of sulfate-S

(SO_4-S) in the watershed is roughly in balance. Sulfate concentrations are equal to 70% of the total base cation concentrations, on an equivalent-weight basis, in soil water below the rooting zone of the reference forest. At current levels, atmospheric inputs of SO_4-S contribute significantly to losses of base cations (K, Ca, Mg, Na) from the rooting zone of many eastern ecosystems. A reduction in the quantity of SO_4-S entering eastern forest soils would likely reduce cation losses from these ecosystems. 40 refs., 2 figs., 6 tabs.

24676 (CFS/OO–46-13/35-1991E, pp. 383-390) **Effects of acid deposition on soil and litter properties: Lysimeter and field studies.** Brown, K.A. (Central Electricity Research Lab., Leatherhead, Surrey (UK)); Skeffington, R.A. Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

A major effect of acidic deposition on litter and soil is claimed to be accelerated leaching of basic cations (Ca^{2+}, Mg^{2+}, K^+) from cation-exchange sites and their replacement by H^+. The mobilization of Al also increases, as in mineral soils of pH 3.5-5.5 solution and precipitation of Al are the main buffering mechanisms. The results of a long-term study in which soil was watered at a reasonably realistic pH are reported and compared with those found in a similar forest soil in the field, in order to highlight similarities and differences compared to the laboratory study. Pairs of lysimeters containing undisturbed soil cores received either distilled water or sulfuric acid (pH 3) at ca 1,500 mm/y for almost 5 years. Significant decreases in pH, base saturation, and basic cations were observed, with significant increases in extractable sulfate and aluminum. The depth distributions and concentrations of pH, extractable ions, Ca, Mg and Mn cations, extractable aluminum, and various biochemical properties are presented. The effects of the presence of trees on extractable Ca, Mg, Mn and Al are displayed. 7 refs., 2 figs., 6 tabs.

24677 (CFS/OO–46-13/35-1991E, pp. 391-399) **Impacts of acid rain on two forested watersheds in Haute Ardenne, Belgium.** Buldgen, P. (Liege Univ. (Belgium)); Remacle, J. Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Two forested watersheds have been studied for four years in eastern Belgium. One of the two watersheds is entirely covered by softwoods, whereas the other one is partly covered by softwoods and partly by hardwoods. The aim of the study is to evaluate the impact of vegetal cover and atmospheric pollution on nutrient turnover and aquifer and streamwater chemistry. Open-site precipitation over the country is acidic. The acidity increases significantly at the level of throughfall rain, through the interception of acidic pollutants by the vegetal cover. This interception is more pronounced for softwoods than for hardwoods, and the acidification by organic matter mineralization seems to depend on both the nature and thickness of the organic layers. The streamwaters flowing out from the two watersheds have percolated through the mineral soil, and in this way, their acidity is to some extent neutralized. Consequently, the watersheds accumulate annually 60-70% of the inputs of acidity from pollutants and organic matter mineralization. 14 refs., 4 figs., 1 tab.

24678 (CFS/OO–46-13/35-1991E, pp. 323-328) **Resource sensitivity assessment.** McFee, W.W. (Purdue Univ., West Lafayette, IN (United States)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

The assessment of resource sensitivity to acidic precipitation is discussed. All the assessments generalize spatially, but have varying scales and levels. Sensitivity generally refers to propensity to acidification, and does not infer more general extrapolations. Historical attempts at resource sensitivity assessment are described. The errors that are easily made in producing sensitivity maps are discussed, and shown to result generally from unwarranted assumptions and neglection of other factors. For example, mapping of agricultural soils at risk to acidification must take into account application of lime fertilizer or other treatments that vastly overshadow any effects of acidic deposition. Mapping should be limited to simple characteristics or at least very simple sets of characteristics.

24679 (CFS/OO–46-13/35-1991E, pp. 303-320) **Acid stress on forest habitats: Implications for terrestrial wildlife.** Schreiber, R.K. (U.S. Fish and Wildlife Service, Kearneysville, WV (United States)); Fischer, K.L. Canadian Forestry Service, Ottawa, ON (Canada). 1991. Forests and their stratified structure provide a diversity of habitats for a variety of wildlife species. Although the influence of acidic deposition on forests is incompletely known, preliminary research indicates that impacts may occur. Indirect impacts on wildlife are possible from modification of habitat and change in trophic relationships. Detection of changes distinguishable from normal spatio-temporal variations in wildlife populations is difficult. An overview is provided of the current information on the impacts of acidic deposition and its precursors on forest resources and the possible implications for terrestrial wildlife. Issues discussed include physiological and ecological responses of wildlife to air emissions, susceptibility of breeding habitat to pH depression for amphibians, effects on amphibians of pH depression, food resources of snake species that may be reduced due to acidic precipitation, habitat and diet of turtle species with range into acid-impacted areas of Canada, mammalian species with diet organisms susceptible to acid precipitation, and avian species most likely to be imapcted by reduced food resources due to acid rain. 79 refs., 1 fig., 10 tabs.

An overview is presented of the implications of acid rain and air pollution with respect to forestry. Possible interactions among air pollutants, ecosystem productivity and forest management that have implications for forest management in North America are discussed, emphasizing acidic deposition resulting from sulfur contamination of the atmosphere. Intensive harvesting techniques can accelerate nutrient removal from forest sites, and in general the degree of forest management must be considered so that potentially adverse effects of air pollution may be identified. Productive capacity and the eventual sustainability of harvests is most significantly determined by the harvesting interval. Clear-cut harvesting of any kind removes the forest canopy, which is the first layer receiving deposition. If understory canopy is removed and the floor is disturbed, the mineral soil will be exposed for some time to the full impacts of acidic precipitation. Whole tree harvesting leaves significantly less residue to contribute to site resilience. Harvesting and

post-harvest treatments influence patterns of snow deposition, and can interact with acid flush into soils or drainage systems. Species conversion can have a variety of implications related to the chemistry of deposition materials reaching the forest floor and mineral soil. 20 refs.

The stability of particular forest communities depends not only on pollutant dose, but on the nature of the ecosystem as well. Acid deposition and other pollutants may be slightly stimulatory or produce no perceptible effects where the dose is small or the ecosystem is complex and well buffered. Where the dose is large or the ecosystem is simpler or poorly buffered, a significantly altered state may ultimately result. Measures of broader aspects of ecosystem functioning can give clues to eventual community changes, but may not reflect changes in special amenities such as the loss or reduction of rare species. It is proposed that the risk of altering natural terrestrial ecosystems through acid deposition or other pollutants, with attendant loss of amenities, will generally increase with the number of following conditions which obtain: relict communities, major ecotones, or other community types growing near the limits of their natural range; communities containing a high proportion of specialists (usually late successional); communities having potentially unstable mineral cycles; and communities subject to major additional disturbances by abiotic or biotic agents such as fire, harvesting, or insect and disease epidemics. 32 refs., 2 figs., 1 tab.

24682 (CFS/OO–46-13/35-1991E, pp. 358-378) **Lake Laflamme catchement basin: Excursion guide.** Robitaille, G. (Centre de Foresterie des Laurentides, Ste-Foy, PQ (Canada)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). The Lake Laflamme catchment is situated 80 km north of Quebec City. The 825 m rise across the area causes an environmental gradient strong enough to delimit several vegetation zones. The climate of the area is characterized by low temperatures and abundant precipitation. Sampling is carried out at the catchment to obtain data on: precipitation and air quality, the deposition and concentration of several ions (H, Ca, Mg, Na, K, NH_4, SO_4, NO_3, PO_4 and Cl) to the terrestrial and aquatic systems, and the seasonal and yearly variations in deposition and concentration; changes in quantity and chemical composition of precipitation as it passes through the vegetation cover; the chemistry of soil percholates; quantity and quality of snowmelt; snow chemistry in the open and under forest cover; lake chemistry; chemistry of lake water inputs and outputs; ion flux through the catchment; and the potential effects of acidification on the accumulation of bioelements by the vegetation. Details are presented of the studies that are being carried out in the catchment, data collected, and agencies participating in the project. 6 figs., 8 tabs.

It has long been established that there is considerable alteration in rainwater chemistry during passage through a forest canopy. There is debate over whether the source of sodium, chloride and sulfate enriching rainwater passing over trees is leaching from the foliar surfaces of interception deposition. A study was carried out of rainwater acidity beneath a range of vegetation types. Data are presented on variations in pH and mean H^+ concentration in water collected from various points on its passage through a Scottish forest ecosystem over a period of 5 years. Considerable annual variation was found, and it was clear that the pattern of annual oscillation in throughfall and stemflow pH develops and intensifies with decreasing average pH of incident rainfall. No effect of soil or physical climate was identified. All species except old Pinus sylvestris reduced acidity in throughfall. It is suggested that crowns may have a role damping the impact of sudden excursions of acidity. 8 refs., 3 figs.

24684 (CFS/OO–46-13/35-1991E, pp. 441-463) **Chemical characteristics of sequential acid-rain episodes, canopy throughfall and steamwater quality in a yellow birch stand, Laurentides Park, Canada.** Jones, H.G. (Quebec Univ., Ste-Foy, PQ (Canada)); Auclair, J.C.; Cluis, D.; Ouellet, M. Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Sequential sampling of incident precipitation, throughfall and streamwaters during individual storm events in a mature yellow birch watershed showed that the effect of tree cover on the precipitation caused the resultant throughfall to reflect chemical characteristics related to dry deposition washoff and leaching of the vegetative canopy. Total canopy net exchange (deposition ratio) of soluble components ($<0.45\mu m$) with the incident precipitation increased in the order of $Pb<H^+<Na^+<SO_4^{2-}<Fe<NO_3^-<Ca^{2+}<Mg^{2+}<Mn<K^+$. The rate of dry deposition washoff was best estimated from Al and Fe analysis of sequential samples, which in turn permitted the determination of net leaching rates of elements where total deposition ratios were high (Ca, Mg, Mn and K). Marked differences between throughfall chemical characteristics of different events (eg. pH) were not reflected by the major headwater streams (pH 4.4-4.8) draining the watershed. Al, present in only low concentrations in both precipitation and throughfall, is found to be constantly present at high concentration in the streamwaters. 19 refs., 15 figs., 1 tab.

24685 (CFS/OO–46-13/35-1991E, pp. 485-494) **Direct and indirect acid-induced changes in foliar chemical content.** Malanchuk, J.L. (State Univ. of New York, Plattsburg, NY (United States)); Rhea, J.R.; Engelbride, E.; Smyth, B.; Miner, W.H. Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Acid deposition may involve changes in chemical content of plant foliage which might disturb forest element cycling. Although acid rain is known to accelerate the leaching of plant substances from foliar surfaces, it is not known whether such changes occur directly at foliar surfaces or indirectly through soil acidification. Pinto beans (Phaseolus vulgaris L.) were grown under greenhouse conditions for 70 days, using soil collected from Whiteface Mountain in the Adirondacks region of New York State. Plants received 50 ml of distilled water three times weekly for 63 days. Thirty days after planting, plants received the same volume of synthetic acid rain

adjusted to pH 2.5, 4.0, and 5.5 depending on treatment. Treatment I received rain by means of an air atomizer with rain percolating into the soil, Treatment II received rain by uniform application to the soil surface without wetting the foliage, while Treatment III received rain like Treatment I but rain was prevented from entering the soil, and 50 ml of distilled water was applied to prevent soil dessication. Leaves were separated after the plants were harvested and analyzed for Al, Ca, Mg, K, Mn, and total N. Results suggest there are differences in elemental concentrations of plant foliage among teatments. Differences varied with the pH of the simulated rain and the elements studied. No general trends for all elements were obvious. 3 refs., 7 figs.

24686 (CFS/OO–46-13/35-1991E, pp. 419-427) **Ion transfer through a tolerant hardwood canopy, Turkey Lakes Watershed, Ontario.** Foster, N.W. (Canadian Forestry Service, Sault Ste-Marie, ON (Canada)); Nicolson, J.A. Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Hydrogen, K, Ca, NO_3-N and SO_4-S were measured, during 1981, outside and within an old-growth sugar maple-yellow birch forest growing on an acid till soil at Turkey Lakes Watershed, Ontario. Mean concentration and contents of elements in precipitation, throughfall and stemflow were compared on an annual, growing season and dormant season basis. Throughfall solutions were similar to precipitation in ionic composition, with the exception of K concentration, during the dormant period, and were less acid and richer in bases and SO_4-S during the growing season. Stemflow solutions were highly enriched in Ca, K and SO_4-S and depleted in H and NO_3-N, during both periods. Throughfall was the major process of element transfer to soil: stemflow accounted for only 1-10% of the total annual deposition of each element to the soil. The role of H in promoting base leaching from the forest canopy is discussed in relation to other eastern North American tolerant hardwood forests, which are more heavily impacted with acid precipitation. 30 refs., 3 tabs.

24687 (CFS/OO–46-13/35-1991E, pp. 400-408) **Soil and bedrock characteristics of eastern Canada: Acidic deposition and implications for forest productivity.** Cowell, D.W. (Environment Canada, Burlington, ON (Canada)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Available soil and bedrock data for eastern Canada have been combined into eight map units representing five dominant terrain types. Three of these five categories describe dominant soil texture: sand, loam and clay. Organic soils and barren terrain (≥75% bedrock outcropping) are the remaining two categories. Given the absence of proven cause and effect relationships between acid deposition and forests, it is considered preferable to map terrain characteristics rather than forest-productivity sensitivity. Hypothetical sensitivity interpretations are provided for sensitivity to base-cation loss, soil acidification and aluminum solubilization. These sensitivities are based on predicted or expected soil properties for each map unit. It is suggested that those areas mapped as sand overlying any rock type or loam overlying granite (primarily acid Podzols and Brunisols) are the most sensitive with respect to forest productivity. This interpretation assumes that Al^{3+} solubilization and the loss of even small amounts of nutrient cations are most significant factors potentially impacting forest systems. The map base is however, sufficiently flexible to allow other interpretations. 20 refs., 1 fig., 2 tabs.

24688 (CFS/OO–46-13/35-1991E, pp. 409-417) **An experiment to assess the sensitivity of soil to acidification.** Dimma, D.E. (Ontario Ministry of Environment, Toronto, ON (Canada)); Griffith, M.A.; Linzon, S.N. Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

In an experiment, surface soil horizons from a variety of soil types across Ontario were treated with acidic reagents (nitric, sulfuric, nitric-sulfuric and simulated rain). Soil pH was then measured to determine the relative sensitivity of the soils to acidification. The surface samples collected from Podzolic soil profiles had pH below 4.5. They were the least sensitive to acidification, possibly due to their abundance of organic matter. Surface soils with pH above 4.5, when combined with acidic reagents, showed greater decreases in soil pH than Podzolic soils under the same conditions. This indicated a lower buffering capacity in the less acidic soils. Within-sample decreases in soil pH were largely a function of the type of acid added to the soil. Generally, nitric acid was the most effective in lowering soil pH while sulfuric acid was the least effective. 7 refs., 2 figs., 3 tabs.

24689 (CFS/OO–46-13/35-1991E, pp. 474-484) **Influence of acidification on metal uptake by plants.** Lobersli, E. (Trondheim Univ., Dragvoll (Norway)); Steinnes, E. Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Increased mobility of metals as a result of soil acidification may affect their availability to plants. A study was carried out to determine the possible influences of soil acidification on plant uptake of aluminum, iron and manganese, major elements in silicate rocks. A study of birch in a local acidification gradient indicated a strong influence on metal uptake. For example, the manganese content of Betula pubescens increases and the iron content decreases with increasing distance from the source. In a comparison of coniferous forest ecosystems in southern and central Norway, metal uptake in plants growing in soils with different acid-base conditions was studied. Corresponding ecosystems in the two regions are compared in search of possible effects of the great difference in exposure to acid precipitation that exists between different parts of the country. Certain spruce ecosystems in southern Norway appear to show higher contents of aluminum in soil extracts and in the wood anenome, Anemone nemorosa, than corresponding ecosystems in central Norway. 2 refs., 6 figs., 2 tabs.

24690 (CFS/OO–46-13/35-1991E, pp. 532-538) **The interaction between mobile anions and aluminum in a shallow podzol.** Nilsson, S.I. (Swedish Univ. of Agricultural Sciences, Uppsala (Sweden)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. The chemical properties of aluminum play a significant role in the acidification of soils and freshwaters. Several compounds and dissolved complexes act as proton buffers. High aluminum concentration can also cause toxicity effects in streams and lakes, which have a high level of other dissolved electrolytes. Data are presented which illustrate the importance of different anions for the aluminum concentration found in the soil solution of a shallow podzol under mixed coniferous forest on the Swedish west coast. The

site is situated within the L. Gardsjon catchment and has been intensively studied since 1979. It was found that a high nitrification potential in an acid soil has implications for the aluminum concentration in the soil solution. 25 refs., 2 figs., 1 tab.

24691 (CFS/OO–46-13/35-1991E, pp. 584-596) **Foliar buffering capacity in boreal species: Sources of variability and potential use of buffering capacity for indexing species sensitivity to acidic pollutants.** Sidhu, S.S. (Canadian Forestry Service, St. John's, NF (Canada)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Foliar buffering capacity (BC) of several boreal species of tree lifeforms (lichens to trees) was determined at nine different times from June 1980 to September 1981. BC varied very little diurnally and with north, south, east and west aspects. In the 1981 foliage of all species, BC was at a maximum during the first two weeks of July and decreased gradually towards fall. In evergreen species, BC of 1980 foliage was half that of the 1981 foliage in the spring and 20-30% lower than 1981 foliage at the end of the growing season. The BC of individual trees of the same species varied significantly and the differences were consistent. In spite of the diurnal, seasonal and intra-specific variations, average BC differences among species were real and genetically controlled. Nutrient analysis of the foliage samples collected in spring and fall of 1980 are also presented. Relative BC of species is compared to reported species sensitivity to sulfur dioxide or acid rain. The potential use of BC for indexing species sensitivity to acid rain appears promising, however requires testing under simulated as well as natural conditions. 12 refs., 3 figs., 5 tabs.

24692 (CFS/OO–46-13/35-1991E, pp. 501-506) **Significance of nutrient cycling processes in forest ecosystems in altering acid rain effects.** Mahendrappa, M.K. (Canadian Forestry Service, Fredericton, NB (Canada)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

The effects of acid rain on terrestrial ecosystems can often be explained in terms of its influence on various nutrient cycling processes. The ecosystems, being dynamic and resilient, can be expected to have mechanisms to buffer acid rain effects. Such resiliency can vary among different ecosystems depending on their components and their ability to counteract or withstand perturbations. Some of the discernible influences of tree species in altering acid rain effects are discussed. Nutrient cycling studies were started during the early 1970s in six softwood and three hardwood stands located at the Acadia Forest Experimental Station in central New Brunswick. From the data obtained, there are at least four distinct species-dependent processes that appear to alter acid rain effects. These processes include: partitioning of rain water; exchange reactions of nutrients at the plant (leaf and bark) surfaces; building up of organic matter (humus) horizons under the stands; and exchange reactions within the organic horizons. The relative significance of each of these processes in altering acid rain effects in different stands is discussed. 5 refs., 1 fig., 5 tabs.

24693 (CFS/OO–46-13/35-1991E, pp. 548-561) **Acid rain, drought, and red spruce growth responses.** Puckett, L.J. (United States Geological Survey, Reston, VA (United States)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Incremental growth cores were collected from red spruce (Picea rubens Sarg.) trees growing on bedrock and on glacial till at the Hubbard Brook experimental forest, West Thornton, New Hampshire. Results of regression analyses of tree growth indices against orthogonally transformed temperature and precipitation data for two time periods, 1932-1956 and 1956-1980 indicate that the relationship of tree growth to climate has been altered. For trees growing over bedrock the variance explained by climate decreased from 56.9 to 23.5% and the variance due to prior growth increased from 2.3 to 66.4%. Statistical t-tests and F-tests of climate data for the two periods indicate that climate has been essentially the same from 1932 through to 1980. The Palmer Drought Index indicates that droughts have occurred in 60% of the last 50 years with a peak magnitude in the mid-1960s. It has been shown that the hydrogen ion component of acid rain is neutralized through dissolution of reactive alumina in glacial till soils. The toxic Al^{3+} thus generated may damage the root systems of the red spruce. However, as a result of the formation of organometallic complexes in the humus layer of the glacial till soils, roots in the humus layer may not be damaged, thereby effectively restricting root systems of trees growing on glacial till to the humus layer. The root systems of trees growing in thick humus over bedrock would not be damaged to the same extent. During prolonged dry periods trees with restricted root systems would be more severely stressed than trees physiologically acclimated to growing in humus over bedrock. 32 refs., 4 figs., 3 tabs.

24694 (CFS/OO–46-13/35-1991E, pp. 562-568) **Alteration of precipitation chemistry by deciduous and coniferous canopies.** Puckett, L.J. (United States Geological Survey, Reston, VA (United States)); Kennedy, M.M. Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Throughfall was collected in adjacent coniferous and deciduous stands in the Mill Run watershed in northwestern Virginia. Nine sample sets during a period of 13 weeks between July and November 1982 had mean pH values of 4.40, 4.37, and 4.11 for precipitation, deciduous througfall and coniferous throughfall, respectively. The pH of coniferous throughfall differed significantly ($P<0.05$) from that of precipitation and deciduous throughfall. Beneath both canopy types there was a net gain of H^+, Ca^{2+}, Mg^{2+}, K^+, NO_3 and SO_{42-} and a net loss of NH_4^+. Calcium ions and Mg^{2+} were preferentially leached from conifers and K^+ from hardwoods. It is assumed that cations are leached from these plant tissues at accelerated rates by H^+ exchange reactions, and by diffusion and mass flow. 19 refs., 1 fig., 2 tabs.

24695 (CFS/OO–46-13/35-1991E, pp. 517-525) **Effects of artificial acid rain on percolate chemistry of two jack pine forest soils.** Morrison, I.K. (Canadian Forestry Service, Sault Ste-Marie, ON (Canada)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Two soils, both acid glacio-fluvial sands from beneath semimature jack pine (Pinus banksiana Lamb.) forest in northern Ontario were reconstructed in 1 m deep column-lysimeters in a greenhouse compartment. Over a 5 1/2 year period, the soils, a humo-ferric Podzol from Wells township and a Dystric Brunisol from Dupuis township were subjected on a weekly basis to artificial acid rain consisting of H_2SO_4 at pH 2, 3, and 4, together with a distilled water control (pH 5.7). The application rate of the simulated rain was equivalent to 1000 mm/y. Percolates were recovered and volumes were recorded weekly; every fourth week, pH, conductivity and

concentrations of SO_4^{2-}, K^+, Na^+, Ca^{2+}, Mg^{2+} and several trace metals including Al, Mn and Zn were determined. The focus was on soil reactions as interpreted from percolate chemistry. Particular attention was paid to the course of events over time. The results of the experiment suggested a stage-by-stage process of element loss: first, both soils, but particularly the humo-ferric Podzol, exhibited considerable initial resistance to base leaching, with SO_4^{2-} movement hampered by strong SO_4^{2-} retention; second, when SO_4^{2-} adsorption capacity reached the saturation point, bases moved freely with excess SO_4^{2-} ions; third, as exchangeable cations were depleted, H^+ ions increasingly dominated the charge composition; concurrently, with the pH of the percolating solutions declining from 6.5 to less than 4.0 during this stage in soils treated with acid rain having a pH of 2, there was substantial mobilization of trace metals, particularly Al. 22 refs., 3 figs., 1 tab.

24696 (CFS/OO–46-13/35-1991E, pp. 508-516) **Biomass and macroelements in a tolerant hardwood stand, Turkey Lakes Watershed, Ontario.** Morrison, I.K. (Canadian Forestry Service, Sault Ste-Marie, ON (Canada)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Data are presented on the distribution of standing-crop biomass and of N, P, K, Ca, Mg and S by components (foliage, live branches, dead branches, stem bark, stem wood, stumps and roots) in an old-growth sugar maple-yellow birch stand on a shallow, Precambria-derived acid till soil in Turkey Lakes Watershed, Ontario. The most abundant element in the standing crop was Ca followed by N>K>Mg>S>P. Presented also, for the same site, are estimates made over a 3 year period of annual total litterfall and the annual cycle of elements from vegetation to soil by this route. The most abundant element in the annual litterfall was N, followed by Ca>K>Mg>S>P. In addition, data are presented on distributions of total organic matter and of elements in the forest floor of the study stand. The order of elements in the forest floor was N>Ca>S>K>Mg>P. The role of litterfall in replenishing bases removed from the soil through plant uptake and leaching is discussed. 24 refs., 1 fig., 3 tabs.

24697 (CFS/OO–46-13/35-1991E, pp. 571-577) **Chemical effects of simulated acid rain on two forest soils.** Rutherford, G.K. (Queen's Univ., Kingston, ON (Canada)); Mortensen, S.F.; Hern, J.A.; Loon, G.W. van. Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Parallel laboratory and field experiments were conducted in which soil columns from the Turkey Lake and Montmorency Forest watersheds were watered with simulated rainfall of pH 5.7, 3.5 and 2.0. The watering solutions had been acidified with dilute H_2SO_4/HNO_3 in a ratio of 2.5:1. Soil pore water samples were analyzed for H^+, NH_4^+, Na, K, Ca, Mg, Fe, Mn, Al, SO_4^{2-}, NO_3^- and Cl. Following treatment, a number of soil properties were studied. Accelerated leaching of cations, especially Ca and Al (and NH_4^+ in the laboratory columns) was observed as a result of pH 2 acid treatment; SO_4^{2-} was the principle anion carrier. Deposition of SO_4^{2-} was most prominant in the litter-humus layer and in the region of the Bfh horizon. The highly acidic treatment led to significant replacement of metallic cations by hydrogen on the exchange complex, and there is tentative evidence of accelerated podzolization under these conditions. There were smaller changes in cation content of pore water when watering was done with pH 3.5 compared with pH 5.7 rainfall. 4 refs., 5 tabs.

24698 (CFS/OO–46-13/35-1991E, pp. 526-531) **Ion movement in terrestrial basins in the Turkey Lakes Forest Watershed.** Nicolson, J.A. (Canadian Forestry Service, Sault Ste-Marie, ON (Canada)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Twenty small feeder streams with basins of 4-65 ha are being monitored so that their contribution to the main aquatic system can be estimated and gross chemical changes in the terrestrial ecosystem measured. Unit flow rates in five streams monitored ranged from 5.0 to 6.3 m^3/ha/y with snowmelt providing 38-55% of total annual discharge. Streams draining headwater areas with shallow soil are generally lower in pH, alkalinity, and conductivity than streams in the main watershed in areas with deeper soil at lower elevations. Feeders with large groundwater flow, as evidenced by annual temperature profiles, have the highest alkalinities and higher values for some major ions, primarily because percolating water has more contact time with soils and unweathered parent material. Nitrogen input exceeded outputs in four of five watersheds, so N appears to be accumulating in this ecosystem. Output of major cations (Ca^{2+}, Mg^{2+}, K^+ and Na^+) exceeded input by precipitation in all cases except for K^+ in one watershed. Sulfate-sulfur input and output are nearly in balance in four basins. Bicarbonate, as reflected in alkalinity values, was more important in balancing cation losses in areas of lower elevation and deeper soil, whereas sulfate appears to play this role in shallow soil headwater basins. Chemical variability between streams in a watershed can be large and some areas are sensitive to increased hydrogen ion load. 4 refs., 1 fig., 3 tabs.

24699 (CFS/OO–46-13/35-1991E, pp. 578-582) **Cuticular and dendrochronological features as indicators of environmental pollution.** Sharma, G.K. (Tennessee Univ., Martin, TN (United States)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Several plant populations of red oak (Quercus rubra) and sweetgum (Liquidambar styraciflua) growing in habitats characterized by varied levels of environmental pollution were studied for dendrochronological and cuticular patterns. Growth rings, ring and porous wood, and related features were analyzed with a dendrochronograph. Cuticular patterns such as stomatal frequency, stomatal size, and trichome frequency and type were studied in relation to environmental pollution in various habitats. Most plant populations under investigation were in the industrial areas of Nashville, Tennessee, known for their high levels of environmental pollution including sulfur dioxide. Statistical analysis of the data revealed the significance of plant features as indicators of environmental pollution in the area. Growth rings were extremely narrow in highly polluted areas, whereas the plant population exhibited fully developed annual increments in relatively low levels of environmental pollution. Trichome frequency increased with pollution, whereas stomatal frequency decreased with polluted habitats. Stomatal size was not signficantly affected by different levels of pollution. Certain morphological features showed adaptations to varied amounts of environmental pollution. 14 refs., 1 tab.

24700 (CFS/OO–46-13/35-1991E, pp. 602-611) **Heavy metal contamination of terrestrial ecosystems from long-range atmospheric transport.** Solberg, W. (Trondheim Univ. (Norway)); Steinnes, E. Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

The deposition of some toxic elements has been shown to be substantially higher in the southernmost part of Norway than in areas further north, mainly because of transport of polluted air from other parts of Europe. Natural surface soils have been shown to exhibit a very similar geographical pattern with respect to the same group of elements. For example, the surface soil Pb content is 10 times higher in the far south than in parts of central and northern Norway, which are not appreciably affected by long-range atmospheric transport of pollutants. Studies of the vertical distribution of metals in soil profiles from different parts of the country lend further support to the idea of atmospheric deposition being the main source of excess Pb and Cd in the surface soils of southern Norway. A comparison of coniferous forest ecosystems in central and southern Norway with respect to heavy metal content of common species of higher plants shows a similar trend as for soils. Concerning Pb and Cd, plants from localities in southernmost Norway show substantially higher contents than those from equivalent localities in central Norway, the difference in many cases amounting to a factor of 5 or more. The essential elements Cu and Zn do not exhibit a similar trend. 9 refs., 6 figs.

24701 (CFS/OO–46-13/35-1991E, pp. 613-620) **Microbial incorporation of sulfate into organic matter in forest soils.** Swank, W.T. (United States Dept. of Agriculture, Forest Service, Otto, NC (United States)); Fitzgerald, J.W.; Ash, J.T. Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

The metabolism of inorganic sulfate into organic matter by microbial populations can be an important process in the sulfur cycle of forest ecosystems. A study was conducted on Coweeta Watershed 18, a 12.5 ha north-facing catchment which has been a primary site of long-term nutrient cycling research. Soils were incubated and then washed and extracted to recover sulfate. The influence of varying amounts of $^{35}SO_4^{2-}$ added to soil samples on the recovery of various fractions is illustrated. Additional recovery data for salt-extractable and non-salt extractable fractions for forest floor and horizons are presented. Potential annual incorporation in forest floor and soil horizons in a mixed deciduous forest in the southern Appalachian mountains was estimated to be 30 kg/ha. The process is partially responsible for apparent sulfur accumulation indicated by ecosystem budgets and affects sulfate mobility, cation leaching, and hence the interpretation of atmospheric sulfuric acid effects on forest ecosystems. 16 refs., 3 figs., 3 tabs.

24702 (CFS/OO–46-13/35-1991E, pp. 621-628) **Stratifying wet atmospheric deposition samples.** Verry, E.S. (United States Dept. of Agriculture, Forest Service, Grand Rapids, MN (United States)); Harris, A.R. Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Changes in forest trees, soils and lakes related to atmospheric deposition cannot be ascribed to the total deposition of sulfate or nitrate and their assumed correlation with hydrogen. Of the total deposition, one portion is associated with high concentrations of salt derived from soil dust or sea spray, and another is associated with normally low salt concentrations and high hydrogen concentrations. A procedure to stratfiy samples into one stratum dominated by basic cations (Ca, Mg, K, Na, and NH_4) and one stratum dominated by hydrogen is presented. Correlation between hydrogen and nitrate, sulfate, or the sum is dramatically improved in the H-dominated stratum. It is suggested that data in this stratum relate better to emissions and measures of resource degradation. 4 refs., 3 figs., 2 tabs.

24703 (CONF-920791–, pp. 7, Paper 8) **In situ fiberoptic monitors for site characterization.** Haas, J.W. III (Oak Ridge National Lab., TN (US)); Matthews, T.G.; Gammage, R.B. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

Contamination of soil and groundwater in the U.S. and many other parts of the world is an enormous problem. Environmental cleanup is requiring considerable expenditures of time and money, especially for initial site characterization and long-term monitoring. Methods that are faster and more efficient are needed to help contain escalating costs. One way to do this is to employ inexpensive instruments to make field measurements of contaminants. Devices that can make direct (in situ) measurements rapidly (in a few minutes or less) are best and can potentially provide more reliable information than conventional sampling and analysis. For example, conventional approaches rely on samples obtained from a few subsurface locations to represent a much larger sampling volume; multipoint sampling is too expensive and time consuming. Also, samples can change composition during transport, holding, and preparation for analysis, ultimately producing unreliable results. Rapid, in situ detection overcomes these limitations by readily providing multipoint measurements without the need to collect and handle samples. In situ monitoring is also safer - site workers and analysts need not be exposed to contaminated samples. The objective is to develop and deploy cost effective, in situ monitoring devices at DOE sites. Specifically, the authors have been designing and fabricating portable spectrometers equipped with fiberoptic probes for in situ detection of contaminants in groundwater and soil gas. In some cases, selective probes are being developed to detect particular classes of contaminants that are difficult to determine by direct spectroscopic analysis (e.g., chlorinated hydrocarbon solvents). This paper will describe progress in the development and demonstration of two of these fiberoptic instruments, a derivative ultraviolet absorbance spectrometer (DUVAS) and a spectroelectrochemical sensor.

24704 (CONF-920791–, pp. 7, Paper 12) **A multisorbent arrayed sampler for in-situ collection of vadose zone volatile organic compounds.** Jenkins, R.A. (Oak Ridge National Lab., TN (US)); Higgins, C.E.; Gayle, T.M.; Allin, G.W.; Smith, R.R. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

This presentation describes briefly the development and initial field demonstrations of multisorbent sampler for in-situ collection of volatile species at depths up to 125 in the vadose zone. The sampler consists of an array of six traps each packed with sequential beds of sorbent materials. One end of each trap can be opened to a screened space. The sampler can be lowered into a 4 diameter screened borehole and controlled from the surface. Air samples of nearly any volume and/or time duration can be passed through the traps and the volatile organics retained. The arrayed sampler is then returned to the surface and the traps analyzed. Inflatable packers can be used to isolate the geologic zone being sampled if appropriate. The system has been successfully deployed and demonstrated at the Savannah River Integrated Demonstration Project site in January and March, 1992. Numerous vadose zone samples were collected. Data acquired during the sampling yielded a wide range of apparent soil gas concentrations. Although recommendations for system modifications are made, it is clear that in its current configuration, the system can provide time and spatially resolved chemical information concerning the impact, effectiveness, and zone of influence of candidate remediation technologies, for both target (trichloroethylene) and non-target species in the vadose zone.

24705 (CONF-920791–, pp. 7, Paper 13) **Passive multi-layer groundwater samplers.** Kaplan, E. (Brookhaven National Lab., Upton, NY (US)). USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

Non-invasive, multi-level groundwater sampling systems were designed and are being tested at the VOC Nonarid ID at the Savannah River Laboratory (SRL). They provide information on the concentration of contaminants and horizontal flows in an aquifer, simultaneously at several depths in the same well. This information is necessary to properly design remediation but cannot be obtained using existing technologies instead, clusters of wells are usually installed at great expense, and samples are pumped from each well. Unfortunately pumping has been shown to perturb the aquifer being investigated and samples which are collected. In addition, samples collected using standard methods represent conditions over some large zone in the vicinity of the pump, not necessarily those conditions where contaminants actually exist. Two different system were constructed using commercially available components. These apparatus were first tested in the laboratory and field at Brookhaven National Laboratory, after which an initial field trial was conducted at SRL in November 1991. Measurements were made on samples collected over a 300 cm interval below the water table. Preliminary results indicate weak vertical profiles of several inorganic species, and a uniform horizontal specific discharge of approximately 6 cm/day. A second field trial in the same wells is scheduled for June 1992. During FY93 these systems will be used in several existing wells at the SRL ID site. Resulting data will be combined to provide a three dimensional perspective of aquifer chemistry and flow, and will be used in numerical models of contaminated fate and transport. Cost/benefit analyses will be made to indicate the substantial savings which are expected.

24706 (CONF-920791–, pp. 6, Paper 18) **Cross borehole electromagnetic imaging of chemical and mixed waste landfills.** Borns, D.J. (Sandia National Labs., Albuquerque, NM (US)). USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

The Mixed Waste landfill Integrated Demonstration (MWLID) seeks to test noninvasive characterization methods at several locations. One location is the Chemical Waste Landfill (CWL) at Sandia National Laboratories, which consists of unlined disposal pits or trenches (10 ft. wide by 1 0 ft. long by 8 feet deep). Another possible location is the Mixed Waste Landfill (MWL), also at Sandia National Laboratories, which consists of unlined pits (10 ft. by 10 ft. by 25 ft. deep) and trenches (40 ft. wide by 100 ft. long by 30 ft. deep). The soils of the landfills are alluvial, predominantly sand with small quantities of sifts and clays. At these mixed-waste sites, the authors are demonstrating two high frequency EM methods (a continuous waveform (CW) and a pulsed radar system) for site characterization. The CW system is a frequency domain system that is driven by a sinusoidal transmitter waveform. Signal amplitude and phase relative to the transmitter waveform are measured. The pulsed system is a time domain system, in which the transmitter is pulsed and the resulting signal is picked up at the receiving antennae. The measurement consists of transient time and signal strength. The authors will interpret the data using existing interpretation methods and new forward and inverse modeling schemes that are under development within the Geophysics Department at Sandia National Laboratories. Both the CW and pulsed methods are sensitive to variations in either electrical conductivity or dielectric constant in the soils or host rock at a waste site. These earth properties are some of the most responsive geophysical indicators of metallic, acidic and water-based subsurface contaminants. Electrical properties are not best suited to map organic contaminants, such as TCE, except in special cases where the organic contaminant reacts with the clays in the subsurface thus changing the conductivity of the clay-bearing unit.

24707 (CONF-920791–, pp. 6, Paper 19) **Nonintrusive and intrusive sensing of environmentally important objects.** Duray, J.R. (Chem-Nuclear Geotech, Inc., Grand Junction, CO (US)); Snyder, D.D.; Mac Lean, H.D.; Hasbrouck, J.C.; George, D.C. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

Integration of various nonintrusive and intrusive geophysics techniques provides an optimum selection of corroborating, complementary data that can be used effectively to characterize buried contamination. This paper briefly presents the substance of live technical tasks that focus on rapid, economical geophysical techniques. Two integrated demonstrations provide the funding support for these tasks: the Buried-Waste Integrated Demonstration (BWID) and the Mixed-Waste Landfill Integrated Demonstration (MWLID). The tensor magnetic gradiometer task is intended to identify magnetic objects and their coordinates. The broadband electromagnetic and other surface techniques task is intended to nonintrusively locate buried wastes, characterize the contents of buried wastes, and detect contaminant plumes. The prompt fission logging task is intended to perform in situ assays for fissile elements and heavy metals.

24708 (CONF-920791–, pp. 4, Paper 20) **Ground-penetrating radar (GPR) for remotely controlled site characterization.** Davis, K.C. (Pacific Northwest Lab., Richland, WA (US)); Sandness, G.A. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

Ground-penetrating radar (GPR) is a non-intrusive sensing method that provides a means of investigating the subsurface of the earth to depths of roughly 0-10 m in typical ground materials. The GPR method is one of the primary tools being used to characterize and remediate hazardous waste burial sites, including those at U.S. Department of Energy (DOE) facilities. Many such sites have already been studied and some have received remedial actions. However, the vast majority still require field investigations, including surface-based geophysical surveys. Survey objectives include: (1) location and characterization of buried waste deposits, (2) detection and mapping of contaminant plumes in groundwater and (3), definition of subsurface geologic and hydrologic features. In comparison with other available sensing methods, GPR offers significant benefits in terms of survey efficiency, spatial resolution, imaging, data interpretability, and versatility. In recent years it has become a primary tool for characterizing hazardous waste burial sites. Unfortunately, the success of the GPR method is strongly site dependent because of the complexity and diversity of the earth materials. The combinations of soil, rock, water, ice, air, plant material, and man-made materials tend to be strong absorbers and reflectors of radar signals; hence, the ground tends to be an unfavorable signal propagation medium. At any given site, the quality of the data is determined largely by the rate of signal absorption in the ground and by clutter (signals reflected from features other than those of interest). The depth at which a given target can be detected and the spatial resolution with which detected objects and structures can be defined are usually determined by the signal-to-clufter ratio in the GPR.

24709 (CONF-920791–, pp. 6, Paper 21) **In situ mapping of radionuclides in subsurface and surface soils.** Schilk, A.J. (Battelle, Pacific Northwest Lab., Richland, WA (US)); Perkins, R.W.; Robertson, D.E.; Brodzinski, R.L. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting

on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

The operation of nuclear facilities at several Department of Energy (DOE) sites has resulted in local contamination of some surface and subsurface soils which commonly occurs within waste burial sites, cribs, and pond bottom sediments, as well as areas surrounding waste tanks, uranium ore and tailings areas, scrap, and slag heaps. The three-dimensional distribution of contaminants within underlying soils must be adequately determined before effective remediation protocols can be established. A specific site of concern is the DOE's Fernald Environmental Management Project (FEMP) facility near Cincinnati, Ohio. The overall objective of this project is to adapt, develop, and demonstrate technologies for the measurement of uranium in surface and subsurface soils at the Integrated Demonstration (ID) Site which lies within the FEMP boundaries, and to evaluate these for other types of radionuclide contamination. To accomplish the subsurface characterization phase of this program, the authors are employing downwell gamma-ray spectrometry sensors for measuring natural and "added" uranium contents as a function of depth and compass direction within existing and yet to be made boreholes. The surface characterization phase of this program will employ two separation detection systems, one of which will measure the gamma-ray emitting radionuctides over relatively large surface areas. This particular technique is expected to be particularly useful in the preliminary screening of the site for identifying areas of elevated uranium concentrations and generating an initial map of surface activity contours. An additional system is being designed to observe the beta radiation emanating from smaller surface areas for the purpose of obtaining a near-instantaneous indication of uranium surface contamination, before and after actual clean-up efforts.

24710 (CONF-920791–, pp. 4, Paper 22) **In situ permeable flow sensor: A device for measuring groundwater flow velocity.** Ballard, S. (Sandia National Labs., Albuquerque, NM (US)). USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

A new instrument which uses a thermal perturbation technique to directly measure the 3-dimensional groundwater flow velocity vector in permeable geologic formations is being developed at Sandia National Laboratories. Since groundwater flow is perhaps the most important mechanism for dispersal of many types of toxic waste once they have been released into the subsurface, accurate information about the groundwater flow field is critical to the characterization of waste sites, monitoring of waste remediation activities and monitoring the post-closure performance of remediated waste sites. The basic operating principle is to bury a thin cylindrical heater in the ground at the point where the groundwater flow velocity is to be measured. If the heat flux out of the cylinder is uniform over the surface of the cylinder then the temperature distribution on the surface of the cylinder will vary as a function of the direction and magnitude of the groundwater flow velocity past the cylinder. In the absence of any flow past the device, the temperature on the surface of the probe will be independent of azimuth and symmetric about the vertical midpoint of the probe. The vertical midpoint will be warmer than the ends of the probe because of end effects. Groundwater flow past the device perturbs the temperature distribution, with the pattern and magnitude of the temperature variations reflecting the direction and magnitude of the groundwater flow velocity. In essence, warmer temperatures are observed on the downstream side of the probe than on the upstream side because the heat introduced into the formation by the heater is advected around the instrument.

24711 (CONF-920791–, pp. 5, Paper 23) **Crosshole seismic characterization and monitoring of an in situ air stripping waste remediation process.** Elbring, G.J. (Sandia National Labs., Albuquerque, NM (US)). USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

New remediation technologies are also being developed and, along with them, methods for monitoring their physical processes and effectiveness need to be developed. In an effort to address both these concerns, crosshole seismic techniques are being developed and applied to assess their imaging capabilities. One of the new remediation technologies is being demonstrated at the Savannah River Site near Aiken, South Carolina. The technology involves the in situ air stripping of contaminated soils and groundwater. A leaking process sewer line contaminated the area under study with volatile chlorinated solvents, primarily trichloroethylene (TCE). To remove the contaminants, two horizontal wells were drilled. Air is injected into the lower well (53 meters deep) and a vacuum is applied to the upper well (20 meters deep) to extract the injected air. As the air passes through the subsurface, the TCE's are picked up and brought out the extraction well. The general geology underlying the site had been mapped through well logs from monitoring wells, but more information was needed between these wells. Little was known about the expected distribution of the air injected into the earth, and this distribution has a direct effect on which areas are remediated and also on the flow regimes set up during the air injection process. Several laboratory studies have shown that the degree of fluid saturation in a formation will affect both the seismic compressional (P) and shear (S) wave velocities, though to different extents. To take advantage of this property, P and S-wave surveys were conducted before the beginning of the air injection to provide a baseline and to image the site geology; and again during the air injection to measure changes caused by the injected air. In this way, paths travelled by the injected air in the subsurface could be imaged.

24712 (CONF-920791–, pp. 5, Paper 24) **The colloidal borescope an instrument for in situ assessment of local subsurface flow parameters.** Cronk, T.A. (Oak Ridge National Lab., TN (US)); Kearl, P.M. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

The colloidal borescope is designed to determine groundwater flow velocity (in the vector sense) by observing the advective transport velocity of indigenous micro-scale particles flowing through a screened well. The observed wellbore velocity is a direct result of the local specific discharge in the surrounding aquifer and, a site-specific determination of groundwater contaminant transport potential is thus achieved. The instrument consists of a charge coupled device (CCD) camera, optical magnification system, illumination source, and stainless steel housing. The device is approximately 60-cm long and has a diameter of 44 mm, facilitating use in a 5-cm observation well. After insertion into the observation well, the electronic image is transmitted to the surface where it is viewed on a 22.9-cm monitor and recorded on VHS tape for further analysis. The magnification factor of the system is 140X, which results in a field of view of approximately 1.0 mm x 1.4 mm x 0.1 mm. Comparison of the observed colloids with microspheres of known size indicates that the viewing size detection limit is on the order of 1 micron. Field use of the colloidal borescope consists of first lowering the instrument into an observation well to the desired depth of investigation. Orientation of the down-hole camera with respect to magnetic north is determined with a down-hole compass. After the depth and orientation of the field of view are determined, microscale flow fields through the wellbore are observed until initial turbulence, caused from instrument insertion, has subsided. Upon establishing steady-state flow, approximately twenty minutes of

flow data are recorded on VHS tape for further analysis. This process is repeated at various depths over the screened interval of an observation well and at various observation wells over a field site to provide a representative characterization of the underlying flow field.

24713 (CONF-920791–, pp. 6, Paper 25) **Electrical resistance tomography used in environmental restoration.** Ramirez, A. (Lawrence Livermore National Lab., CA (US)); Daily, W.; LaBrecque, D. USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

The authors are developing a new imaging technique, Electrical Resistance Tomography (ERT), to map subsurface liquids as flow occurs during natural or clean-up processes; ERT can also be used to map geologic structure. Natural processes (such as surface water infiltrating the vadose zone) and clean-up processes (such as air injection in the saturated zone, steam injection, emplacement of subsurface barriers) can create changes in a soil's electrical properties that are readily measured. The authors use these measurements to calculate tomographs that show the spatial distribution of the subsurface resistivities The information derived from ERT can be used by remediation projects to: monitor the effectiveness of clean-up processes, characterize hydrologic processes affecting contaminant transport, select appropriate clean-up alternatives, demonstrate regulatory compliance, and to verify the installation and performance of subsurface barriers.

24714 (CONF-920791–, pp. 6, Paper 26) **The development of the high resolution S-wave reflection technique as a tool for improving subsurface characterization and groundwater studies.** Johnson, W.J. (Paul C. Rizzo Associates, Monroeville, PA (US)). USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

The main objective of this research has been to develop the technology necessary to make high resolution S- wave profiling a useful tool in conducting the shallow groundwater investigations. Conventional seismic reflection technology using compressional (P-) waves has developed to the point where this technique has become a major component of numerous environmental assessments. Extending this technology to include shear (S-) waves offers the potential for greatly enhancing the data which can be extracted from the subsurface, in particular improving resolution and determining the fluid characteristics of subsurface layers. In some areas, thin clay layers can have a major impact on the groundwater flow. Similary, thin sand lenses within an otherwise confining medium can control the migration of contaminants. Thin subsurface layers, whether they are aquitards or aquifers, can be difficult targets for conventional and sampling programs. Sampling intervals normally used may be inadequate for dectecting thin beds and it is commonly difficult to prove the continuity of individual horizons boring on based alone. Geophysical methods are often used, especially to define continuity, but results are often unsatisfactory because of the lack of resolution. One of the most powerful tools for conducting an engineering or groundwater investigation is the high resolution seismic reflection technique. This method normally uses P-waves to provide acoustic images of the subsurface. Resolution is dependent on the frequency content of the waves and the velocity of the subsurface materials. This is also true if S-waves are used instead of P-waves. The difference is that the S-waves travel with different velocities and at different predominant frequencies, which implies that their ability to resolve subsurface levers will also be different. In general, the interpretation of groundwater conditions requires a comparison of P- and S-wave data.

24715 (CONF-920791–, pp. 3, Paper 30) **On-site analysis of metals in soils using stripping voltammetry.** Olsen, K.B. (Pacific Northwest Lab., Richland, WA (US)); Wang, J.; Setiadjii, R. US-DOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

Screening methods are needed for field teams to use in identifying contaminated samples, thereby decreasing the number of samples and prioritizing those samples sent to the off-site analytical laboratory for chemical analysis. One such technology is being evaluated by DOE at the Mixed Waste Landfill Integrated Demonstration Project at Sandia National Laboratory: Stripping Voltammetry (SV) is being used to measure the concentrations of leachable chromium, uranium, lead, cadmium, copper, nickel, zinc, and cobalt in sediment leachate samples collected during drilling operations. Over the past few years, researchers at New Mexico State University has been developing methods for analyzing various metals in solutions using masking and stripping reagents that significantly increase specificity. For example, by utilizing 8-hydroxyquinoline as a complexing agent, uranium in groundwater can be measured at the part-per-billion level. New Mexico State University demonstrated SV capabilities at the Hanford Site by measuring chromium concentrations in groundwater at the well head using a mobile laboratory. A detection limit of 1 ppb was measured in the groundwater using the complexing agent diethylenetriaminepenta-acetic acid (DTPA). The measurement technique was simple and had a wide dynamic operating range. Because of the success associated with the measurement of chromium and uranium in ground water, the SV technique will be extended under this project supported by the DOE Office of Technical Development. The technique will be used to measure leachable chromium, uranium, lead, cadmium, copper, nickel, zinc, and cobalt in sediment samples as a field screening technique at Sandia National Laboratory's Chemical and Mixed Waste Landfills.

24716 (CONF-920791–, pp. 4, Paper 33) **Soil/sediment characterization of organic co-contaminants using coupled supercritical fluid extraction/optical detection (SFE/OD) systems.** Riley, R.G. (Pacific Northwest Lab., Richland, WA (US)). USDOE Assistant Secretary for Environmental Restoration and Waste Management, Washington, DC (United States). Jul 1992. From Information exchange meeting on characterization sensors and monitoring technologies; Dallas, TX (United States); 15-16 Jul 1992. In *Proceedings of the information exchange meeting on characterization, sensors, and monitoring technologies.* 261p. Order Number DE93005318. Source: OSTI; NTIS.

Throughout the more than forty years of nuclear fuels reprocessing at the Hanford Site's 200 West Area, an estimated 637 t of the volatile organic compound (VOC) carbon tetrachloride, co-mixed with similar quantities of other organic contaminants, including mono-, di-, and tributylphosphates; dibutylbutylphosphonate; and lard oil (a complex mixture of triglycerides), were disposed to cribs and trenches. Because the quantities released were so large, the co-disposed organic contaminants will have a significant effect on (1) the subsurface fate of VOCs and (2) the performance of in situ technologies to remediate VOCs in the vadose zone. Therefore, technologies are needed that (1) make characterization data available for contaminant screening and in-field technology deployment decision-making faster, (2) reduce costs (e.g., allowing sample characterization in the field as opposed to a remote laboratory), (3) reduce the amount of waste generated, and (4) address the problem of measurement of organic constituents in radioactively contaminated wastes, soils, and sediments. Supercritical fluid extraction (SFE) uses either pure carbon dioxide or carbon dioxide that contains small quantities of modifiers (organic chemicals such as methanol) at supercritical temperatures and pressures to extract contaminants from soils and sediments into a small amount of organic solvent. Optical detection (OD) techniques (e.g., infrared spectroscopy) are then used instead of chromatographic techniques (e.g., gas chromatography) to measure contaminants in the solvent, facilitating application in the field.

24717 (CONF-930371–Absts.) **Fourth annual Walker Branch Watershed research symposium: Program and abstracts.** Oak Ridge National Lab., TN (United States). Mar 1993. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 4. annual Walker Branch Watershed research symposium; Oak Ridge, TN (United States); 18-19 Mar 1993. Order Number DE93009356. Source: OSTI; NTIS; INIS; GPO Dep.

The methods and concepts of watershed research, originally applied in an experimental or monitoring mode to relatively small catchments, are increasingly being used at larger scales and for specific applied problems. Research at Oak Ridge National Laboratory, the Tennessee Valley Authority, the US Forest Service, and other agencies and institutions participating in this symposium reflects research over a broad range of spatial scales that is being integrated through large-scale experiments along with computer modeling and graphical interfaces. These research projects address the basic atmospheric, geophysical, biogeochemical, and biological processes that regulate the responses of forested ecosystems to natural environmental variation and anthropogenic stresses. This symposium highlights the use of large-scale ecosystem experiments to address environmental issues of global concern. These experiments provide the only effective way to test models of ecosystem response that are based on the current state of knowledge of hydrology, biogeochemistry, plant physiology, and other ecosystem processes. Major environmental problems that are being addressed include acidic deposition and nitrogen loading (Bear Brook Watershed, Maine; and the Girdsjoen Covered Catchment, Sweden); climate warming (Soil Warming Experiment, Maine); and altered rainfall amounts (Savannah River Loblolly Pine Soil Water Manipulation and the Walker Branch Watershed Throughfall Displacement Experiment).

24718 (CONF-930403–33) **Human-factors-based implementation of the remote characterization system high-level control station.** Noakes, M.W. (Oak Ridge National Lab., TN (United States)); Richardson, B.S.; Rowe, J.C.; Draper, J.V.; Sandness, G.R. Oak Ridge National Lab., TN (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 5. topical meeting on robotics and remote systems; Knoxville, TN (United States); 26-29 Apr 1993. Order Number DE93010340. Source: OSTI; NTIS; INIS; GPO Dep.

The detection and characterization of buried objects and materials is an important first step in the restoration of the numerous US Department of Energy (DOE) and US Department of Defense waste disposal sites. DOE, through its Environmental Restoration and Waste Management Robotics and Technology Development Program, has developed the Remote Characterization System (RCS) to address the needs of remote subsurfacecharacterization. The RCS consists of a low-metal-content (low-metallic-signature) remotely piloted vehicle, a high-level control station (HLCS) where operators can remotely control the vehicle and analyze real-time data from sensors, and an array of sensors that can be chosen to meet the survey task at hand. Communication between the vehicle and the base station is handled by a radio link. Site mapping is made possible through the use of geopositioning satellite data. The primary mode of vehicle operation is teleoperation, but provision has been made for semiautonomous or supervisory control that allows for automated sitesurvey on simple sites. Data analysis and display is supported for both real-time observation and postprocessing of data. The particular emphasis of this paper documents the human-factors-based design influences on the HLCS and describes the design in detail.

24719 (CONF-930523–2) **Ecological investigation of a hazardous waste site, Warner Robins, Georgia.** Wade, M. (Oak Ridge National Lab., TN (United States)); Billig, P. Oak Ridge National Lab., TN (United States). [1993]. 16p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. From 18. National Association of Environmental Professionals (NAEP) annual conference on current and future priorities for environmental management; Raleigh, NC (United States); 24-26 May 1993. Order Number DE93009663. Source: OSTI; NTIS; INIS; GPO Dep.

Landfill No. 4 and the sludge lagoon at Robins Air Force Base, Warner Robins, Georgia, were added to the United States Environmental Protection Agency (EPA) National Priorities List in 1987 because of highpotential for contaminant migration. Warner Robins is located approximately 90 miles southeast of Atlanta. In 1990 CH2M HILL conducted a Remedial Investigation at the base that recommended that further ecological assessment investigations be conducted (CH2M HILL 1990). The subject paper is the result of this recommendation. The ecological study was carried out by the Hazardous Waste Remedial Actions Program (HAZWRAP)Division of Martin Marietta Energy Systems, Inc., working jointly with its subcontractor CDM (CDM 1992a). The primary area of investigation (Zone 1) included the sludge lagoon, Landfill No. 4, the wetland area east of the landfill and west of Hannah Road (including two sewage treatment ponds), and the area between Hannah Road and Horse Creek (Fig. 1). The bottomland forest wetlands of Zone 1 extend from the landfill east to Horse Creek. Surface water and groundwater flow across Zone 1 is generally in an easterly direction toward Horse Creek. Horse Creek is a south-flowing tributary of the Ocmulgee River Floodplain. The objective of the study was to perform a quantitative analysis of ecological risk associated with the ecosystems present in Zone 1. This investigation was unique because the assessment was to be based upon many measurement endpoints resulting in both location-specific data and data that would assess the condition of the overall ecosystem. The study was segregated into five distinct field investigations: hydrology, surface water and sediment, aquatic biology, wetlands ecology, and wildlife biology.

24720 (CONF-930701–3) **Unusually amplified summer or winter indoor levels of radon.** Gammage, R.B.; Dudney, C.S.; Wilson, D.L. Oak Ridge National Lab., TN (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 6. international conference on indoor air quality and climate; Helsinki (Finland); 4-8 Jul 1993. Order Number DE93010277. Source: OSTI; NTIS; INIS; GPO Dep.

The ratios of winter/summer indoor radon levels for houses in different regions of the southern Appalachians are characterized by individual log-normal distributions with geometric means both above and below unity. In some counties and cities, subpopulations of houses have unusually exaggerated winter/summer ratios of indoor radon, as well as high indoor radon levels, during periods of either warm or cool weather. It is proposed that in many instances, houses are communicating with larger than normal underground reservoirs of radon-bearing air in hilly karst terrains; differences between the outdoor and underground air temperatures are believed to provide density gradients producing aerostatic pressure differences for seasonally directed underground transport and subsequently elevated indoor radon. These seasonal movements of air are analogous to the well-known underground chimney effects, which produce interzonal flows of air inside caves.

24721 (CONF-930769–1) **Vapor stripping of VOC-contaminated clay soils.** West, O.R. (Oak Ridge National Lab., TN (United States)); Siegrist, R.L.; Lucero, A.J.; Jennings, H.L.; Schmunk, S.W. Oak Ridge National Lab., TN (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1993 joint Canadian Society of Civil Engineers-American Society of Civil Engineers (CSCE-ASCE) national conference on environmental engineering; Montreal (Canada); 12-14 Jul 1993. Order Number DE93011847. Source: OSTI; NTIS; INIS; GPO Dep.

Vapor stripping is a treatment process in which volatile organic contaminants (VOCs) are removed from contaminated soil by high-pressure aeration. This technology is potentially applicable to low-permeability soils when coupled with in situ soil mixing. A laboratory evaluation of in situ vapor stripping was conducted for TCE-contaminated deposits (>80% silt and clay, and hydraulic conductivity $\leq 10^{-6}$cm/sec) underlying a land disposal site located at a DOE facility. Intact soil cores taken from contaminated areas and re-packed soil cores spiked with TCE were treated in an apparatus that simulated the vapor stripping process. Removal efficiencies calculated from pre- and posttreatment samples were predominately greater than 85%. In some of the spiked cores, soil

samples were taken during treatment to establish removal efficiency as a function of treatment time.

24722 (DOE/ER/30196–3) **The influence of naturally-occurring organic acids on model estimates of lakewater acidification using the model of acidification of groundwater in catchments (MAGIC): Summary of research conducted during year 1.** Sullivan, T.J. (E and S Environmental Chemistry, Inc., Corvallis, OR (United States)); Eilers, J.M.; Cosby, B.J.; Driscoll, C.T.; Hemond, H.F. E and S Environmental Chemistry, Inc., Corvallis, OR (United States). 5 Mar 1993. 102p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER30196. Order Number DE93013259. Source: OSTI; NTIS; INIS; GPO Dep.

A project for the US Department of Energy, entitled "Incorporation of an organic acid representation into MAGIC (Model of Acidification of Groundwater in Catchments) and Testing of the Revised Model UsingIndependent Data Sources" was initiated by E&S Environmental Chemistry, Inc. in March, 1992. Major components of the project include: improving the MAGIC model by incorporating a rigorous organic acid representation, based on empirical data and geochemical considerations, and testing the revised model using data from paleolimnological hindcasts of preindustrial chemistry for 33 Adirondack Mountain lakes, and the results of whole-catchment artificial acidification projects in Maine and Norway. The ongoing research in this project involves development of an organic acid representation to be incorporated into the MAGIC modeland testing of the improved model using three independent data sources. The research during Year 1 has included conducting two workshops to agree on an approach for the organic acid modeling, developing the organic subroutine and incorporating it into MAGIC (Task 1), conducing MAGIC hindcasts for Adirondack lakes and comparing the results with paleolimnological reconstructions (Task 2), and conducting site visits to the manipulation project sites in Maine and Norway. The purpose of this report is to provide a summary of the work that has been conducted on this project during Year 1. Tasks 1 and 2 have now been completed.

24723 (DOE/ER/60247–T4) **[A data collection program focused on hydrologic and meteorologic parameters in an Arctic ecosystem].** Kane, D. Alaska Univ., Fairbanks, AK (United States). [1992]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-84ER60247. Order Number DE93013241. Source: OSTI; NTIS; GPO Dep.

The hydrologic cycle of an arctic watershed is dominated by such physical elements as snow, ice, permafrost, seasonally frozen soils, wide fluctuations in surface energy balance and phase change of snow and ice to water. At Imnavait basin, snow accumulation begins in September or early October and maximum snowpack water equivalent is reached just prior to the onset of ablation in mid May. No significant mid winter melt occurs in this basin. Considerable snowfall redistribution by wind to depressions and valley bottom is evident. Spring snowmelt on the North Slope of Alaska is the dominant hydrologic event of the year.This event provides most of the moisture for use by vegetation in the spring and early summer period. The mechanisms and timing of snowmelt are important factors in predicting runoff, the migrations of birds and large mammals and the diversity of plant communities. It is important globally due to the radical and abrupt change in the surface energy balance over vast areas. We were able to explore the trends and differences in the snowmelt process along a transect from the Brooks Range to the Arctic Coastal plain. Snowpack ablation was monitored at three sites. These data were analyzed along with meteorologic data at each site. The initiation of ablation was site specific being largely controlled by the complementary addition of energy from radiation and sensible heat flux. Although the research sites were only 115 km apart, the rates and mechanisms of snowmelt varied greatly. Usually, snowmelt begins at the mid-elevations in the foothills and progresses northerly toward the coast and southerly to the mountains. In the more southerly areas snowmelt progressed much faster and was more influenced by sensible heat advected from areas south of the Brooks Range. In contrast snowmelt in the more northerly areas was slower and the controlled by net radiation.

24724 (DOE/ER/60727–T1) **Effects of egg incubation condition on the post-hatching growth and performance of the snapping turtle, Chelydra serpentina.** Ryan, K.M. State Univ. of New York, Buffalo, NY (United States). Dept. of Biology. Dec 1990. 76p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER60727. Order Number DE93012037. Source: OSTI; NTIS; GPO Dep.

The effect of incubation temperature on the post-hatching growth and performance capacities of the common snapping turtle, Chelydra serpentina was investigated in the laboratory. Turtle eggs were collected from four sites in New York State and randomly assigned to four incubation temperature treatments to produce males (constant 26°C and downshifted 30-26-30°C) and females (constant 30°C and upshifted 26-30-26°C) under constant and altered temperature regimes. The incubation conditions resulted in 92% males from the constant 26°C group and 93% males from the downshifted group. 100% females resulted from both the constant 30°C group and the upshifted group. Turtles hatching from eggs incubated constantly at 26°C were significantly larger than hatchlings from eggs incubated at a constant 30°C or downshifted. Hatchlings were raised in individual aquaria at 25°C and fed earthworms and fish. After a 9-month growth period, turtles which had been incubated at a constant 30°C gained significantly more mass than did turtles from eggs which had been downshifted or upshifted. There was no extended effect of incubation condition on Post-hatching performance and learning ability as measured by righting and feeding responses. Thus, the mass gain differences seen in this study suggest that physiological differences do result as the consequence of incubation condition. However, these physiological differences are not reflected in normal locomotive or feeding behavior.

24725 (DOE/ER/60727–T2) **Energetics of free-living box turtles (Terrapene carolina) near Aiken, South Carolina.** Penick, D.N. (State Univ. of New York, Buffalo, NY (United States)). State Univ. of New York, Buffalo, NY (United States); Savannah River Ecology Lab., Aiken, SC (United States). Aug 1992. 92p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER60727 ;AC09-76SR00819. Order Number DE93012038. Source: OSTI; NTIS; GPO Dep.

I measured field metabolic rates (FMR), water fluxes, and activity patterns of the box turtle Terrapene carolina on the Savannah River Plant, Aiken Co., SC, from September, 1987 to October, 1988. Doubly labeled water ($HT^{18}O$) measurements of production (field metabolic rates, FMR) of telemetered turtles were taken in conjunction with measurements of operative temperatures (T_e), turtle movement patterns, and micrometerological data consisting of air, litter, and substrate temperatures, solar and total radiation, and wind speed. Operative temperatures were used to predict standard (SMR) and maximum (MMR) metabolic rates, and these were compared to field metabolic rates (FMR) of box turtles in South Carolina. Turtles were inactive for most of the winter and for long periods of time during the rest of the year. Water fluxes (ml/kg*D) were 8.8, 18.9, and 26.4 in the winter, late spring, and early fall, respectively. There was no statistically significant sexual difference in FMR so these results were pooled for each season. Mean mass specific metabolic rates (ml CO_2/g*h) were 0.028, 0.0654, and 0.124 for the winter, spring, and fall, respectively. There was a significant difference in metabolic rates for the seasons of the year. In winter, FMR is substantially elevated above SMR and close to MMR, while in spring and fall FMRs are midway between SMR and MMR (SMR = 0.004, 0.010, and 0.017, and MMR = 0.034, 0.154, and 0.208 (ml CO_2/9*h) in the winter, spring, and fall, respectively). The low field metabolic rate of box turtles and low annual reproductive output is characteristic of a low energy specialist. This strategy may allow them to survive and flourish in an uncertain resource and reproductive environment by minimizing costs and risks, thereby maintaining greater lifetime reproductive output.

24726 (DOE/ER/60847–T1) **Stabilization of microorganisms for in situ degradation of toxic chemicals: Final report.** Crawford, R.L.; Ralston, D.R. Idaho Univ., Moscow, ID (United States). Center for Hazardous Waste Remediation Research. [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-89ER60847. Order Number DE93013223. Source: OSTI; NTIS; INIS; GPO Dep.

Methods for large-scale microencapsulation of bacteria and nutrients into microbeads with small enough diameters to travel through aquifers have been developed at the University of Idaho. Both free

and immobilized cells of Flavobacterium ATCC 39723, a gram-negative aerobe that degrades various chlorinated phenols, into aquifer microcosms, through which pentachlorophenol (PCP)-contaminated groundwater flowed at in situ flow rates. Aquifer samples were collected with an auger from three wells at the University of Idaho Ground Water Research Site, and packed into 24 columns. Some sterile columns were also prepared, by irradiation at the Washington State University Radiation Center. In some of the columns the free Flavobacterium cells were mixed with the aquifer material before packing the columns. In others, agarose-microimmobilized Flavobacterium were mixed into the aquifer material. The effluent from each column was collected daily for 170 days and analyzed by UV spectroscopy or HPLC for remaining PCP. There were no statistically significant differences between the degradation rates of free or encapsulated Flavobacterium in sterile or native aquifer material as tested in these experiments. This work has shown at the lab scale that encapsulated PCP-degrading Flavobacterium were able to survive under conditions of starvation, predation, and lack of water.

24727 (DOE/ER/60977–4) **Simulation of landscape disturbances and the effect of climatic change: Final report, July 15, 1990–January 14, 1993.** Baker, W.L. Wyoming Univ., Laramie, WY (United States). Dept. of Geography and Recreation. Apr 1993. 122p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER60977. Order Number DE93013374. Source: OSTI; NTIS; GPO Dep.

Altering the natural disturbance regime of a landscape produces changes in the structure of that landscape as the landscape adjusts to the new disturbance regime. A computer simulation model was designed to enable analyses of the longterm changes to be expected in landscapes as their disturbance regime changes. The model, DISPATCH, is the first dynamic spatial simulation model built around a geographical information system (GIS). The model also includes a new set of programs, the r.le programs, that is the first set of programs designed for calculating landscape structure measures within a GIS. The DISPATCH model was used, to analyze the effects of human alterations of disturbance regimes and global change on landscape structure. Landscapes do not adjust quickly to these alterations based on available data. Landscapes subjected to warming or to longterm fire suppression experience a decline in patch richness, Shannon diversity, the amount of edge and contrast, but an increase in distance between patches, angular second moment (texture measure) and patch size. In contrast, landscapes subjected to cooling, the short-term effects of fire suppression, fragmentation, or traditional prescribed burning tend to respond with increasing richness, Shannon diversity, edge, and contrast, but declining distance, angular second moment, and size. The pattern of response is different at different scales, with important implications for species.

24728 (DOE/ER/60991–T1) **Physiologically anaerobic microorganisms of the deep subsurface: Progress report, June 1, 1990–May 30, 1991.** Stevens, S.E. Jr.; Chung, K.T. Memphis State Univ., TN (United States). Dept. of Biology. Jun 1991. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-90ER60991. Order Number DE93015561. Source: OSTI; NTIS; GPO Dep.

This study seeks to determine numbers, diversity, and morphology of anaerobic microorganisms in 15 samples of subsurface material from the Idaho National Engineering Laboratory, in 18 samples from the Hanford Reservation and in 1 rock sample from the Nevada Test Site; set up long term experiments on the chemical activities of anaerobic microorganisms based on these same samples; work to improve methods for the micro-scale determination of in situ anaerobic microbial activity;and to begin to isolate anaerobes from these samples into axenic culture with identification of the axenic isolates.

24729 (DOE/ER/60991–T2) **Physiologically anaerobic microorganisms of the deep subsurface: Progress report, June 1, 1991–May 31, 1992.** Stevens, S.E. Jr.; Chung, K.T. Memphis State Univ., TN (United States). Dept. of Biology. Jun 1992. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-90ER60991. Order Number DE93015562. Source: OSTI; NTIS; GPO Dep.

A variety of different media were used to isolate facultatively (FAB) and obligately anaerobic bacteria (OAB). These bacteria were isolated from core subsamples obtained from boreholes at the Idaho National Engineering Lab. (INEL) or at the Hanford Lab. (Yakima). Core material was sampled at various depths to 600 feet below the surface. All core samples with culturable bacteria contained at least FAB making thisthe most common physiological type of anaerobic bacteria present in the deep subsurface at these two sites. INEL core samples are characterized by isolates of both FAB and OAB. No isolates of acetogenic, methanogenic, or sulfate reducing bacteria were obtained. Yakima core samples are characterized by a marked predominance of FAB in comparison to OAB. In addition, isolates of acetogenic, methanogenic, and sulfate reducing bacteria were obtained. The Yakima site has the potential for complete anaerobic mineralization of organic compounds whereas this potential appears to be lacking at INEL.

24730 (DOE/ER/61484–5) **Small scale laboratory studies of flow and transport phenonmena in pores and fractures, Phase II: Second yearly progress report.** Wilson, J.L. New Mexico Inst. of Mining and Technology, Socorro, NM (United States). Apr 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-92ER61484. Order Number DE93013295. Source: OSTI; NTIS; GPO Dep.

Small scale laboratory experiments, equipped with an ability to actually observe behavior on the pore level using microscopy, provide an economical and easily understood scientific tool to help us validateconcepts and assumptions about the transport of contaminants, and offers the propensity to discover heretofore unrecognized phenomena or behavior. The main technique employs etched glass micromodels, composed of two etched glass plates, sintered together, to form a two dimensional network of three dimensional pores. Flow and transport behavior is observed on a pore or pore network level, and recorded on film and video tape. This technique is coupled with related column studies. Specifically we're examining multiphase flow behavior of relevance, for example, to liquid-liquid mass transfer (solubilization of capillary trapped organic liquids); liquid-gas mass transfer (in situ volatilization); colloid movement, attachment and detachment in the presence of fluid-fluid interfaces; bacteria colonization and motility in porous systems; and heterogeneity effects on multi-phase flow, colloid movement and bacteria behavior.

24731 (DOE/ID/13167–T2) **Engineering considerations for the recovery of cesium from geologic materials.** Whalen, C. Jason Associates Corp., San Diego, CA (United States). 18 May 1993. 159p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-92ID13167. Order Number DE93015092. Source: OSTI; NTIS; GPO Dep.

Sorption coefficients for cesium in a variety of media have been compiled from a search of the open literature. The sorption coefficient, or K_d, is a description of a dissolved substance's tendency to attach to a solid substrate. The compilation of K_dS reported here for cesium demonstrate that this element readily sorbs ontogeological material. As a result of this sorption, the mass transport of cesium in the environment will be retarded. This retarded mass transport, characterized by the retardation factor, can be expected to be significant when compared to water velocities through porous-sorbing medium, such as geologic materials. K_dS for cesium are in the range of 100 mℓ/g up to 10,000 mℓ/g. K_dS are also an important parameter in the design of engineered systems for the purpose of recovering cesium from soils. The engineering design is based on a material-balance description of the extraction process. The information presented in this report provides a basis to predict the movement of cesium through geologic materials and also to design and predict the performance of extraction processes such as soil washing.

24732 (DOE/NV/10845–T11) **Prehistoric spatial patterning and subsistence studies: Archaeological investigations at Sample Unit U19arP4, Nevada Test Site, Nye County, Nevada.** Johnson, W.G.; DuBarton, A.; Edwards, S.; Drollinger, H. Nevada Univ., Reno, NV (United States). Quaternary Sciences Center. 1992. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE93015315. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the methods and results of archaeological investigations at Sample Unit U19arP4 on Pahute Mesa at the Nevada Test Site (NTS). Eight sites were located there: four lithic artifact scatters (26NY1370, 26NY1372, 26NY3666 and 26NY3667), two temporary camps (26NY3665 and 26NY5418), one artifact locality (26NY5419), and one quarry (26NY3664). One of the lithic scatters, 26NY3667, incorporated a previously recorded rock ring, 26NY1371, that could not be relocated during subsequent investigations. Surface artifacts were collected from all but two of the sites, 26NY1370 and 26NY1372. The data retrieved from these investigations include over one thousand artifacts, such as projectile points, bifaces, debitage, groundstone, and pottery. The temporally diagnostic materials indicate periodic use of Sample Unit U19arP4 from the Middle Archaic to the Shoshonean period.

24733 (DOE/NV/10845–T12) **Archaeological investigations at Sample Unit U19aq, Nevada Test Site, Nye County, Nevada.** Jones, R.C.; DuBarton, A.; Holz, B.A.; Pippin, L.C.; Beck, C.M. Nevada Univ., Reno, NV (United States). Quaternary Sciences Center. 1992. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE93015316. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the methods and results of archaeological investigations at sample unit U19aq on Pahute Mesa. Seven sites were studied: two lithic artifact scatters (26NY4577 and 26NY4584), two temporary camps (26NY4585 and 26NY4588), two rock rings (26NY4592 and 26NY4593), and two flakes (26NY7855). Surface artifacts were collected from all seven sites. Excavations were confined to one test pit at 26NY4584 and two test pits at 26NY4585. The data retrieved from these investigations include over eight thousand artifacts, such as projectile points, bifaces, debitage, groundstone, pottery and beads. The temporally diagnostic materials indicate periodic use of sample unit U19aq from 3250 B.P. to historic times. Most of the cultural remains reflect the specialized activities of hunters and gatherers occupying temporary camps.

24734 (DOE/NV/10845–T13) **The archaeology of drill hole U20bc, Nevada Test Site, Nye County, Nevada.** McLane, A.R.; Hemphill, M.L.; Livingston, S.J.; Pippin, L.C.; Walsh, L.A. Nevada Univ., Reno, NV (United States). Quaternary Sciences Center. 1992. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE93015317. Source: OSTI; NTIS; INIS; GPO Dep.

Impacts to four sites near drill hole U20bc on Pahute Mesa in the northwestern part of the Nevada Test Site were mitigated through data recovery. The work was done during 1988 by the Desert Research Institute for the Department of Energy, Nevada Field Office (DOE/NV)- The four sites that warranted data recovery were 26NY3171, 26NY3173, 26NY5561 and 26NY5566. These sites had previously been determined eligible to the National Register of Historic Places. They were temporary camps that contained lithic debitage, projectile points, milling stones and pottery, and therefore contributed significant information concerning the prehistory of the area. The study of the archaeological remains shows that the prehistoric people subsisted on plant foods and game animals as determined by the artifacts including manos, metates, pottery, lithic scrapers, and projectile points. The time sensitive arfifacts (pottery and diagnostic points) suggest that the region was used from about 12,000 B.P. to just before the historic period, possibly 150 years ago. DOE/NV has met its obligation to mitigate adverse impacts to the cultural resources at U20bc. Therefore, it is recommended that this project proceed as planned.

24735 (DOE/NV/10845–T14) **Lithic technology studies: Archaeological research at drill hole U19ba, Nye County, Nevada.** Walsh, L.A.; Pippin, L.C.; Henton, G.H.; McLane, A. Nevada Univ., Reno, NV (United States). Quaternary Sciences Center. 1992. 84p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE93015318. Source: OSTI; NTIS; INIS; GPO Dep.

In 1989, the Desert Research Institute conducted two archaeological reconnaissances of drill hole U19ba on the Nevada Test Site (NTS) for the Department of Energy, Nevada Field Office (DOE/NV). Eighteen archaeological sites were located there, nine of which were collected when recorded. The DOE/NV chose to investigate these sites and requested a data recovery plan for 26NY4183, 26NY4184, 26NY5914, 26NY5916, 26NY5917, and 26NY5922. Field investigations, primarily controlled surface collections, were carried out in May 1990 and, in the process, another two sites, 26NY7357 and 26NY7358, were discovered. Theses studies focused on core-biface technology, cultural thermal alteration, techniques used to analyze lithic debitage, and the recovery of small sized artifacts. Results of these analyses indicate that flake blanks produced from cores were an important component of biracial technology at these sites, thermal alteration was important throughout the reduction sequence, the techniques used to analyze debitage mask variability, and that the recovery of small sized artifacts reveals biracial final finishing and notching activity at 26NY5917. Based on projectile point chronology, the project area was periodically visited from about 7,000 years ago to about 400 years ago.

24736 (DOE/NV/10845–T15) **Archaeological investigations at drill hole U19bg, Nevada Test Site Nye County, Nevada.** Klimowicz, J.; Pippin, L.C.; Henton, G.J.; Walsh, L.A. Nevada Univ., Reno, NV (United States). Quaternary Sciences Center. 1992. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE93015319. Source: OSTI; NTIS; INIS; GPO Dep.

In 1983 and 1989, the Desert Research Institute conducted cultural resources reconnaissances of the U19bg drill hole area on the Nevada Test Site for the Department of Energy, Nevada Field Office (DOE/NV). These reconnaissances identified several archaeological sites, two of which were considered eligible to the National Register of Historic Places. DOE/NV chose to mitigate adverse impacts to one of these, 26NY3391, through a data recovery program. Fieldwork was conducted in June, 1990 and data analysis continued through the spring of 1991. This report presents the results of the data recovery at drill hole U19bg. The artifact analyses indicate that the area was repeatedly occupied by prehistoric inhabitants for about 7,000 years, from approximately 8,000 to 800 years ago. The principal activity at the sites, lithic tool production and refinishing, remained relatively constant through time.

24737 (DOE/NV/10845–T16) **Temporary camps at drill hole U19aq on Pahute Mesa, Nye County, Nevada.** Pippin, L.C.; Reno, R.L.; Henton, G.H.; Hemphill, M.; Lockett, C.L. Nevada Univ., Reno, NV (United States). Quaternary Sciences Center. 1992. 142p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE93015591. Source: OSTI; NTIS; GPO Dep.

The US Department of Energy, Nevada Field Office, has proposed a nuclear test at drill hole U19aq (902100N/585000E, Nevada Coordinate System, Central Zone) on Pahute Mesa, Nevada Test Site, Nevada. In compliance with Section 106 of the National Historic Preservation Act, the DOE/NV had the Quatenary Sciences Center, Desert Research Institute, identify and evaluate the potential effects of this activity on cultural resources. To determine the nature of cultural resources in the area, DRI conducted a Class III intensive archaeological survey of an approximately 1-km^2 area around the drill hole. That survey, conducted in June 1985, located and recorded 20 archaeological sites. Two of those sites, interpreted as temporary camps of ancient hunters and gatherers, covered an extensive portion of the area proposed for nuclear testing. Half the sites were small concentrations of artifacts or isolated artifacts and were collected at the time of their discovery and 10 sites were left in place. Those sites were in danger of being adversely affected by the land-disturbing activities proposed at the drill hole. In August and September 1985, DRI conducted limited test excavations (15 test units) at those sites to further evaluate their scientific significance and to provide information that could be used in designing a plan for data recovery.

24738 (DOE-RAS–92.007) **The role of the plant litter layer in the recycling of radiocaesium in upland habitats.** Horrill, A.D. (Institute of Terrestrial Ecology, Grange-on-Sands (United Kingdom). Merlewood Research Station); Kennedy, V.H.; Dent, T.L.; Thomson, A.J. Department of the Environment, London (United Kingdom). Radioactive Substances Div. Aug 1992. [56p.] Contract

PECD-7/9/522;Project ITE T07050H5. Order Number DE93625615. Source: OSTI; NTIS (US Sales Only); INIS.

Field and laboratory studies have been used to investigate the role of the plant litter layer in upland habitats. Radiocaesium, deposited unhomogeneously, by the Chernobyl accident, ranged from 1 3000 - 2 400 Bq kgsup(-1) in a range of plant litters in May 1992. In the field 45% of the ^{137}Cs in heather litter was released over a two year period. Litter leachates contained 0.1 -0.7 Bq 1^{-1} of ^{137}Cs. Microbial population size has also been shown to affect ^{137}Cs release rates in laboratory experiments on heather and spruce litter. ^{137}Cs distribution within litter has been investigated by sequential extraction techniques and it was shown that there is a potential long term immobilization of c. 20% of litter ^{137}Cs by the lignin component. (author).

This report details activities in administering Savannah River Site public lands for wildlife management. Accomplishments in administering hunts, gathering biological data, and in coordinating land use are described.

24740 (DOE/SR/15191–7) **Natural resources management activity and biodiversity maintenance: Progress report, July 1, 1992–June 30, 1993.** Caudell, M.B. South Carolina Wildlife and Marine Resources Dept., Columbia, SC (United States). May 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-87SR15191. Order Number DE93015564. Source: OSTI; NTIS; GPO Dep.

Activities in coordinating land use for the Savannah River Site public lands during the period of July 1, 1992 to June 30, 1993 are reported.

24741 (DOE/SR/18159–2) **The effects of soil mineral phases on the abiotic degradation of selected organic compounds: Annual progress report.** Sandu, S.S. Claflin Coll., Orangeburg, SC (United States). Jun 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-90SR18159. Order Number DE93015621. Source: OSTI; NTIS; GPO Dep.

Tetraphonylboron (TPB) will be used to precipitate radioactive 137Cs from high level nuclear waste water, at the Defense Waste Processing Facility (DWPF) which is operated by the US Department of Energy (US DOE), at the Savannah River Site (SRS), Aiken, SC. The decontaminated wastewater will contain millimolar quantities of TPB that will be processed into salt concretions. The waste processing operations will require about 3×10^5 kg/yr of TPB during its full scale operation. The transportation and use of large amounts of TPB can potentially result in the release of TPB into soil or aquatic environments where its degradation will take place. Previous studies have shown that TPB degrades abiotically in soils; however, the role of specific mineral surfaces in mediating the reaction kinetics and mechanisms for the abiotic degradation of TPB are not clearly known. Laboratory studies have been undertaken to evaluate the surface facilitated degradation of TPB by aluminum silicate clay minerals-kaolinite and montmorillonite. Preliminary results indicate that the rate of degradation of TPB is much higher in kaolinite-a single layer mineral-than in montmorillonite - a double layer mineral- and Orangeburg loamy soil. The initial products of TPB degradation in both minerals are diphenylboric acid (DPBA) and biphenyl. However, HPLC monitoring of degradation products of TPB in montmorillonite appears to indicate the presence of phenol and monophenyboric acid (MPBA).

24742 (DOE/SR/18271–1) **Degradation of mix hydrocarbons by immobilized cells of mix culture using a trickle fluidized bed reactor: Annual progress report, June 1992–May 1993.** Chapatwala, K.D. Selma Univ., AL (United States). Div. of Natural Sciences. [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-92SR18271. Order Number DE93015592. Source: OSTI; NTIS; GPO Dep.

The microorganisms, capable of degrading mix hydrocarbons were isolated from the soil samples collected from the hydrocarbon contaminated sites. The mix cultures were immobilized in calcium alginate solution in the form of beads. A trickle fluidized bed air-uplift-type reactor designed to study the degradation of mix hydrocarbons was filled with 0.85% normal saline containing the immobilized cells of mix culture. The immobilized beads were aerated with CO_2-free air at 200 ml/min. The degradation of different concentrations of hydrocarbons in the presence/absence of commercially available fertilizers by the immobilized cells of mix culture is now in progress.

24743 (EGG–10617-2187) **Distribution, life history, management, and current status of Astragalus beatleyae on the US Department of Energy's Nevada Test Site.** Blomquist, K.W.; Wills, C.A.; Ostler, W.K.; Rautenstrauch, K.R.; O'Farrell, T.P. EG and G Energy Measurements, Inc., Goleta, CA (United States). Santa Barbara Operations. Nov 1992. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-88NV10617. Order Number DE93007553. Source: OSTI; NTIS; GPO Dep.

A beatleyae is a small milk vetch found in south-central Nevada on portions of the Nevada Test Site (NTS) and Nellis Air Force Range. This species has been classified as a Category 1 candidate species for federal listing under the Endangered Species Act because of its limited range and threats from human activities, primarily activities conducted by the US Department of Energy, Nevada Field Office (DOE/NV). The status of A. beatleyae was last evaluated over 13 years ago (Rhoads et al., 1979, Beatley, 1978). Since then, numerous conservation measures have been taken by DOE/NV and additional information on the status of this population has been obtained. Field surveys have been conducted to locate new populations of A. beatleyae. Because of this work, the known range of this species has been expanded approximately 300%. DOE/NV has established. a conservation agreement with the US Fish and Wildlife Service and developed a Species Management Plan. This report is a presentation of the results of that population monitoring study. Also included in this report are a review of other field investigations and conservation measures taken by DOE/NV, a review of the current threats to A. beatleyae, and a reassessment of the status of this species under the Endangered Species Act.

24744 (EGG-ESQ–10614) **Summary report: Assessment of deep injection well associated surface soils at the Idaho National Engineering Laboratory.** Pole, S.B. EG and G Idaho, Inc., Idaho Falls, ID (United States). Jan 1993. 102p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93010756. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes sampling activities and analytical results of the chemical and radiological content of surface soils from storm water retention basins and drainage ditches associated with eight deep injection wells at the Idaho National Engineering Laboratory. The results of the sampling effort were intended to support permitting of the injection wells by the State of Idaho Department of Water Resources. In August 1992, the surface soils associated with eight storm water retention basins and ditches were sampled. All samples were collected and analyzed in accordance with a written sampling and analysis plan. The samples were analyzed by an off-Site contract laboratory, and the results were compared to local and regional soil analytical data to determine the presence of contaminants. The results indicated that the surface soils from the storm water retention basins and ditches did not have concentrations of metals or radionuclides greater than the range of concentrations found in local and regional soils. Volatile organic compounds were below detection limits.

24745 (EMO–1096-Vol.1) **Shemya AFB, Alaska 1992 IRP field investigation report: Volume 1: Final report.** Pacific Northwest Lab., Richland, WA (United States). Environmental Management Operations; Air Force Alaskan Air Command, Elmendorf AFB, AK (United States); CH2M Hill, Boise, ID (United States). Feb 1993. 340p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. DEU-91-06. Order Number DE93011968. Source: OSTI; NTIS; INIS; GPO Dep.

The US Air Force is currently investigating 22 sites on Shemya Air Force Base (AFB) to determine if past spill and disposal activities have caused environmental damage. These investigations are being carried out under the Air Force's Installation Restoration Program (IRP). As a part of the IRP program, field investigations were performed in 1992 to obtain the information needed to assess what future actions willneed to be carried out at each site. The island's drinking water supply was also investigated. Activities completed at 10 selected sites during the 1992 field investigation included surface sampling to determine the lateral extent of contamination, subsurface sampling to determine the vertical extent of contamination, and the installation of well points and monitoring wells to determine the direction of groundwater flow and if the groundwater has been affected by a site. In addition, geophysical surveys were performed at most sites to identify site boundaries and check for the presence of buried metal to be avoided during drilling activities.

24746 (EMO–1096-Vol.3) **Shemya AFB, Alaska 1992 IRP field investigation report: Volume 3, Appendixes B, C, and D: Final report.** Pacific Northwest Lab., Richland, WA (United States). Environmental Management Operations; Air Force Alaskan Air Command, Elmendorf AFB, AK (United States); CH2M Hill, Boise, ID (United States). Feb 1993. 547p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. DEU-91-06. Order Number DE93011970. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains appendices E and F with information on the following: soil boring logs, and data validation of samples analyzed.

24748 (ES/ER/TM–55) **An innovative approach to multimedia waste reduction: Measuring performance for environmental cleanup projects.** Phifer, B.E. Jr. (Oak Ridge K-25 Site, TN (United States)); George, S.M. Oak Ridge K-25 Site, TN (United States); Weston (Roy F.), Inc., Oak Ridge, TN (United States). Apr 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011693. Source: OSTI; NTIS; INIS; GPO Dep.

One of the greatest challenges we now face in environmental cleanup is measuring the progress of minimizing multimedia transfer releases and achieving waste reduction. Briefly, multimedia transfer refers to the air, land, and water where pollution is not controlled, concentrated, and moved from one medium to another. An example of multimedia transfer would be heavy metals in wastewater sludges moved from water to land disposal. Over $2 billion has been budgeted for environmental restoration site cleanups by the Department of Energy (DOE) for FY 1994. Unless we reduce the huge waste volumes projected to be generated in the near future, then we will devote more and more resources to the management and disposal of these wastes. To meet this challenge, the Martin Marietta Energy Systems, Inc., Oak Ridge Environmental Restoration (ER) Program has explored the value of a multimedia approach by designing an innovative Pollution Prevention Life-Cycle Model. The model consists of several fundamental elements (Fig. 1) and addresses the two major objectives of data gathering and establishing performance measures. Because the majority of projects are in the remedial investigation phase, the focus is on the prevention of unnecessary generation of investigation-derived waste and multimedia transfers at the source. A state-of-the-art tool developed to support the life-cycle model for meeting these objectives is the Numerical Scoring System (NSS), which is a computerized, user-friendly data base system for information management, designed to measure the effectiveness of pollution prevention activities in each phase of the ER Program. This report contains a discussion of the development of the Pollution Prevention Life-Cycle Model and the role the NSS will play in the pollution prevention programs in the remedial investigation phase of the ER Program at facilities managed by Energy Systems for DOE.

24749 (JAERI-M–93-034) **Radionuclide migration behavior at the low adsorption region on the aerated soil testing, 2: Effect of inflow volume and migration analysis.** Takebe, Shinichi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Mukai, Masayuki; Komiya, Tomokazu; Kamiyama, Hideo. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1993. 20p. (In Japanese). Order Number DE93797601. Source: OSTI; NTIS; INIS.

Migration test of desorbed radionuclides from a soil layer, contaminated with ^{60}Co, ^{85}Sr and ^{137}Cs, by using large column soil samples taken out in the undisturbed state, was continued. Radionuclide migration behavior at the low adsorption region were investigated of reduced inflow volume of the ground water just before the breakthrough of tritiated water. Integrated analysis was made for all testing results of migration concentration profile in the soil layer, and effluent concentration profile on elapsed time. ^{85}Sr and ^{137}Cs were not observed in the deeper soil layer of the column at such a low inflow volume, ^{60}Co showed a low concentration migration profile with a concentration peak in the deeper soil layer. The migration behavior of ^{60}Co at the low adsorption region was analyzed by using a non-equilibrium migration model taking in consideration of sorption and desorption rates and a maximum sorption capacity. This model was able to explain consistently all the test results in account of the migration of movable non-cationic form of ^{60}Co. Initial fraction of the movable form in the contaminated soil layer was estimated to be around 0.1 %. (author).

24750 (KCP–613-4857) **Annual site environmental report for calendar year 1991, Kansas City Plant, Kansas City, Missouri.** Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. May 1992. 250p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE93012378. Source: OSTI; NTIS; GPO Dep.

The purpose of this report is to present a summary of the environmental data for the Kansas City Plant, characterize site environmental management performance, provide compliance status with applicable environmental standards and requirements, and highlight significant achievements, programs, and efforts which go beyond regulatory requirements. This monitoring program is designed to measure non-radiological releases to the air, water

(surface and ground), and soil during historical/routine operations and to detect any accidental non-radioactive releases. One hundred sixty three monitoring wells (some with multiple completions), five sampling points at the uv/ozone system, three ambient air monitoring stations, and sampling results from four outfalls, nine surface water sites, and one sanitary discharge are used in the monitoring program. No radioactive materials are machined or processed at this plant.

24751 (KFKI–1992-20/K) **A new method for the determination of radionuclide distribution in the soil by in situ gamma-ray spectrometry.** Zombori, P. (Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics); Andrasi, A.; Nemeth, I. Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics. Jun 1992. [38p.] Order Number DE93625616. Source: OSTI; NTIS (US Sales Only); INIS.

A method was searched for to estimate the penetration characteristics of fallout radioactivity, using only spectral information obtained by in situ spectrometric measurements, and avoiding the need for long and tiresome sampling and sample analysis procedures. To speed up the analysis for depth distribution determination of fallout radioactivity in soil, an instrumental method based on the shape of spectra was developed. The ratio of peak to valley (the region between the photopeak and Compton edge) depends on the penetration of radionuclides in soil, providing an estimation of depth profile. These ratios were calculated and the method was tested by actual measurements. (R.P.) 7 refs.; 14 figs.; 2 tabs.

24752 (K/SUB–90-NH989/2) **1990 annual ground-water report K-1407-B and K-1407-C interim status units Oak Ridge K-25 Site.** Oak Ridge K-25 Site, TN (United States); Geraghty and Miller, Inc., Oak Ridge, TN (United States). Feb 1991. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OT21400. Order Number DE93012196. Source: OSTI; NTIS; INIS; GPO Dep.

The Tennessee Department of Health and Environment (TDHE) Rules Governing Hazardous Waste Management require that specific ground-water information for interim status units be reported in conjunction with the annual hazardous waste treatment, storage, and disposal report (TN 1200-1-11-.05(6)(e)1 and 2). To be included in the report are, the data from annual/semiannual ground-water sampling, results of statistical analyses, and an evaluation of ground-water surface elevations for units in detection monitoring. Martin Marietta Energy Systems, Inc. manages the K-25 Site in Oak Ridge, Tennessee for the Department of Energy. Two interim status units at K-25 require ground-water monitoring, the K-1407-B and K-1407-C Holding Ponds. Both of these units were surface impoundments that have been drained and the waste sludges removed in response to the November 8, 1988, interim status closure milestone. The K-1407-C Pond was drained in mid-1987 and sludge removal activities were completed in November of 1988. The K-1407-B Pond was drained inOctober 1988, and sludge removal activities were completed in August of 1989. Both units have undergone soil sampling to verify complete sludge removal which would allow them to be "clean closed" under interim status regulations. Analytical results of soil samples from K-1407-C Pond are currently being evaluated and soil samples from K-1407-B Pond are undergoing laboratory analysis at this time. This report presents the results of the ground-water monitoring conducted at each unit in compliance with interim status regulations.

24753 (LA–12416-MS) **Elemental composition of background soils from Arches National Park, Utah.** Gladney, E.S. (Los Alamos National Lab., NM (United States)); Ferenbaugh, R.W.; Belnap, J. Los Alamos National Lab., NM (United States). May 1993. 21p. Sponsored by Department of the Interior, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93011038. Source: OSTI; NTIS; GPO Dep.

Background elemental data on soil composition at Arches National Park are reported. The enrichment factor analysis of the soil data from Arches National Park provides some interpretation of the current elemental status of soils at the park. These data provide a basis for determining changes in elemental enrichment status in the future.

24754 (LA–12417-MS) **An investigation of sulfur concentrations in soils and pine needles in Bandelier National Monument, New Mexico.** Gladney, E.S. (Los Alamos National Lab., NM (United States)); Ferenbaugh, R.W.; Jones, E.A.; Bell, M.G.; Morgan, J.D.; Stallings, E.A.; Nelson, L.A.; Lundstrom, C.; Bowker, R.G. Los Alamos National Lab., NM (United States). Mar 1993. 48p. Sponsored by Department of the Interior, Washington, DC (United States). DOE Contract W-7405-ENG-36. Agreement 0475-4-8009. Order Number DE93011990. Source: OSTI; NTIS; INIS; GPO Dep.

Sulfur measurements in different age groups of pinon pine needles and adjacent soil samples from ten sampling sites at Bandelier National Monument were determined using combustion elemental analysis and chromatographic techniques. The primary goal was to establish base-line levels for elemental sulfur in the Monument. Sulfur levels in foliage and soils were evaluated using analysis of variance techniques. Foliage sulfur concentrations differed significantly among the 10 sampling sites and among trees within sites; however, needles of different ages did not differ significantly in sulfur content. Average soil concentrations were very low, approximately 12% of the average needle concentrations. Soil sulfur concentrations also differed significantly among the 10 sampling sites and at different depths in the soil. No statistical differences were evident in soils sampled at the four compass points (N,S,E,W) around each tree. These differences imply that large numbers of samples are needed to identify small effects from anthropogenic inputs of sulfur into the system or that the effects must be large relative to the differences among sampling sites and individual trees in order to be detected.

24755 (LA–12418-MS) **An investigation of sulfur concentrations in soils and pine needles in Canyonlands National Park, Utah.** Gladney, E.S. (Los Alamos National Lab., NM (United States)); Ferenbaugh, R.W.; Jones, E.A.; Bell, M.G.; Morgan, J.D.; Nelson, L.A.; Lundstrom, C.; Bowker, R.G. Los Alamos National Lab., NM (United States). Mar 1993. 46p. Sponsored by Department of the Interior, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93011992. Source: OSTI; NTIS; INIS; GPO Dep.

Sulfur measurements in different age groups of pinon pine needles and adjacent soil samples from ten sampling sites at Canyonlands National Park were determined using combustion elemental analysis and chromatographic techniques. The primary goal was to establish base-line levels for elemental sulfur in the Park. Sulfur levels in foliage and soils were evaluated using analysis of variance techniques. No significant differences were found in foliage sulfur concentrations among the 10 sampling sites; however, trees within sites were significantly different. Needles of different ages did not differ significantly in sulfur content. Average soil concentrations were very low, approximately 4% of the average needle concentrations. Soil sulfur concentrations also differed significantly among the 10 sampling sites and at different depths in the soil. No statistical differences were evident in soils sampled at the four compass points (N,S,E,W) around each tree. These differences imply that large numbers of samples are needed to identify small effects from anthropogenic inputs of sulfur into the system, or that the effects must be large relative to the differences among sampling sites and individual trees in order to be detected.

24756 (LA–12419-MS) **An investigation of sulfur concentrations in soils and pine needles in Chaco Culture National Historical Park, New Mexico.** Gladney, E.S. (Los Alamos National Lab., NM (United States)); Ferenbaugh, R.W.; Jones, E.A.; Bell, M.G.; Morgan, J.D.; Nelson, L.A.; Bowker, R.G. Los Alamos National Lab., NM (United States). Mar 1993. 46p. Sponsored by Department of the Interior, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93011991. Source: OSTI; NTIS; INIS; GPO Dep.

Sulfur measurements in different age groups of pinon pine needles and adjacent soil samples from ten sampling sites at Chaco Culture National Historical Park were determined using combustion elemental analysis and chromatographic techniques. The primary goal was to establish base-line levels for elemental sulfur in the Park. Sulfur levels in foliage and soils were evaluated using analysis of variance techniques. No significant differences were found in

foliage sulfur concentrations among the 10 sampling sites; however, trees within sites were significantly different. Needles of different ages did not differ significantly in sulfur content. Average soil concentrations were low, approximately 30% of the average needle concentrations. Soil sulfur concentrations did not differ significantly among the 10 sampling sites; however, different depths in the soil had statistically different concentrations of sulfur. No statistical differences were evident in soils sampled at the four compass points (N,S,E,W) around each tree. These differences imply that large numbers of samples are needed to identify small effects from anthropogenic inputs of sulfur into the system or that the effects must be large relative to the differences among sampling sites and individual trees in order to be detected.

24757 (LA–12498-PR) **Laboratory and field studies related to the Hydrology/Radionuclide Migration Project: Progress report, October 1, 1991–September 30, 1992.** Thompson, J.L. (comp.) (ed.). Los Alamos National Lab., NM (United States). Jan 1993. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93008078. Source: OSTI; NTIS; INIS; GPO Dep.

The research done in FY 1992 at Los Alamos as part of the Hydrology/Radionuclide Migration Project is detailed in this report. We describe our work in support of the Department of Energy defense and environmental restoration programs at the Nevada Test Site. The Appendix of this report lists meetings attended, documents prepared or reviewed, and articles published during FY 1992. We evaluated the extent of tritium concentration gradients in piezometer tubes in hole UE3e#4 and observed the lack of tritium and ^{85}Kr in holes UE4t and UE20bh-1. We measured the tritium and fission product distributions as a function of depth in the re-entry hole U4ups2a and collected samples that in-dicate that a large fraction of fission product radionuclides in the water at this site are associated with particulates and are not in solution. We have prepared a history of holes drilled in Yucca Flat that details the effects of water confined at high pressure in certain tuff units there. Our work at the Cambric site is continuing; this year we observed small changes in the concentrations of tritium, ^{85}Kr, and ^{137}Cs resulting from the absence of pumping at this site. We analyzed debris from a recent nuclear test to determine the spatial distribution of fission products and their leachability into groundwater.

24758 (LA-SUB–93-38) **On application of SAMFT1D and SAMFT2D codes to the carbon tetrachloride data from Westinghouse Hanford Corporation of the 200 West Area at Hanford.** Yushu Wu (HydroGeoLogic, Inc., Herndon, VA (United States)). Los Alamos National Lab., NM (United States); HydroGeoLogic, Inc., Herndon, VA (United States). Jun 1992. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93008000. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental transport of Carbon Tetrachloride thru soils at the Hanford Reservation is described. The SAMFTID code was utilized. Boundary conditions, relative permeability, capillary pressure, porosity and permeability, and grid design are described.

24759 (LA-SUB–93-76) **Ecological risk assessment of depleted uranium in the environment at Aberdeen Proving Ground: Annual report, 1991.** Clements, W.H. (Colorado State Univ., Fort Collins, CO (United States). Dept. of Fishery and Wildlife Biology); Kennedy, P.L.; Myers, O.B. Los Alamos National Lab., NM (United States); Colorado State Univ., Fort Collins, CO (United States). Dept. of Fishery and Wildlife Biology. [1993]. 32p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93008911. Source: OSTI; NTIS; INIS; GPO Dep.

A preliminary ecological risk assessment was conducted to evaluate the effects of depleted uranium (DU) in the Aberdeen Proving Ground (APG) ecosystem and its potential for human health effects. An ecological risk assessment of DU should include the processes of hazard identification, dose-response assessment, exposure assessment, and risk characterization. Ecological risk assessments also should explicitly examine risks incurred by nonhuman as well as human populations, because risk assessments based only on human health do not always protect other species. To begin to assess the potential ecological risk of DU release to the environment we modeled DU transport through the principal components of the aquatic ecosystem at APG. We focused on the APG aquatic system because of the close proximity of the Chesapeake Bay and concerns about potential impacts on this ecosystem. Our objective in using a model to estimate environmental fate of DU is to ultimately reduce the uncertainty about predicted ecological risks due to DU from APG. The model functions to summarize information on the structure and functional properties of the APG aquatic system, to provide an exposure assessment by estimating the fate of DU in the environment, and to evaluate the sources of uncertainty about DU transport.

24760 (LA-SUB–93-169) **Survey for bats in the Los Alamos National Environmental Research Park, with special emphasis on the spotted bat, Euderma maculatum.** Tyrell, K.; Brack, V. Jr. Los Alamos National Lab., NM (United States); 3D/Environmental Services, Inc., Cincinnati, OH (United States). 29 Oct 1992. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93012081. Source: OSTI; NTIS; GPO Dep.

To increase knowledge about the presence of endangered species and their habitat at the LANL, 3D/Environmental Services, Inc. conducted a mist net survey for bats on Laboratory lands. In addition to documenting the presence of threatened and endangered species, this survey was conducted to gain more knowledge about the diversity and distribution of the bat fauna existing on the Laboratory. There are 25 species of bats found in New Mexico, about 16 of which are likely to occur in the region of the Laboratory. Of particular interest was documentation of the presence of the spotted bat, Euderma maculatum. The spotted bat is listed as Endangered, Group 2 by the State of New Mexico, and is a Federal Candidate for listing as endangered. As such, conservation of this species and its habitat should be a management priority on the Laboratory. A total of 94 bats were captured in 16 net nights, between 30 June and 05 July 1992. Thirteen species of bats were caught during the study: Antrozous pallidus (pallid bat), 10.6 percent; Eptesicus fuscus (big brown bat), 10.6 percent; Lasionycteris noctivigans (silver-haired bat), 16 percent; Lasiurus cinereus (hoary bat), 11.7 percent; Myotis californicus (California myotis), 4.3 percent; M. evotis (long-eared myotis), 7.4 percent; M. leibii (small-footed myotis), 5.3 percent; M. thysanodes (fringed myotis), 13.8 percent; M. volans (long-legged myotis), 7.4 percent of the catch; M. yumanensis,(Yuma myotis), 5.3 percent; Pipistrellus hesperus (western pipistrelle), 1.1 percent; Plecotus townsendii (Townsend's big-eared bat), 1.1 percent, and Tadarida brasiliensis (Brazilian free-tailed bat), 5.3 percent.

24761 (LA-UR–93-484) **Depleted uranium risk assessment at Aberdeen Proving Ground.** Ebinger, M.H. (Los Alamos National Lab., NM (United States)); Myers, O.B.; Kennedy, P.L.; Clements, W.H. Los Alamos National Lab., NM (United States). [1993]. 10p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9303112–1: American Defense Preparedness Associates symposium on the environment, Albuquerque, NM (United States), 23-25 Mar 1993). Order Number DE93008705. Source: OSTI; NTIS; INIS; GPO Dep.

The Environmental Science Group at Los Alamos and the Test and Evaluation Command (TECOM) are assessing the risk of depleted uranium (DU) testing at Aberdeen Proving Ground (APG). Conceptual and mathematical models of DU transfer through the APG ecosystem have been developed in order to show the mechanisms by which DU migrates or remains unavailable to different flora and fauna and to humans. The models incorporate actual rates of DU transfer between different ecosystem components as much as possible. Availability of data on DU transport through different pathways is scarce and constrains some of the transfer rates that can be used. Estimates of transfer rates were derived from literature sources and used in the mass-transfer models when actual transfer rates were unavailable. Objectives for this risk assessment are (1) to assess if DU transports away from impact areas; (2) to estimate how much, if any, DU migrates into Chesapeake Bay; (3) to determine if there are appreciable risks to the ecosystems due to DU testing; (4) to estimate the risk to human health as a result of DU testing.

24762 (LA-UR–93-1200) **Manipulating remotely-sensed data with Khoros.** Kelly, P.M.; White, J.M. Los Alamos National Lab., NM (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9305168–2: Application Visualization System (AVS) '93 users group meeting, Orlando, FL (United States), 24-26 May 1993). Order Number DE93012622. Source: OSTI; NTIS; GPO Dep.

Satellite image analysis typically requires the handling of very large data sets, and the amount of data which will be available from satellite sensors in the future is immense. In this paper, the authors describe two particular remote-sensing applications which they have approached using the Khoros system. The first application discussed is the clustering of large multispectral data sets for efficient analysis and classification. The second application is the automatic identification of urban areas using texture measures and various pattern recognition routines. They have installed a number of new routines into the Khoros environment for working on these projects.

24763 (MLM–3517) **The Mound site survey project for the characterization of radioactive materials in site soils.** Stought, R.L.; Edling, D.A.; Draper, D.G. Mound, Miamisburg, OH (United States). 16 May 1988. 181p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-88DP43495. Order Number DE93011021. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the results of a site survey project conducted at Monsanto Research Corporation's Mound Facility during 1982–1985. The objectives of the site survey were: To characterize the nineteen sites previously identified as having known levels of contamination; to identify and characterize by quantity and type of radionuclide(s) any additional major sites having levels of contamination exceeding 10 pCi/g (for Pu-238) of soil; to estimate the volume of contaminated soil; and to estimate the cost of stabilizing or removing the contaminated soil. This report provides information on objectives 1 and 2 above. A separate report will address objectives 3 and 4.

24764 (ORNL/ER–138) **Surface radiological investigations at environmental research area 11, ^{137}Cs- and ^{60}Co-contaminated plots at Oak Ridge National Laboratory, Oak Ridge, Tennessee: Environmental Restoration Program.** Uziel, M.S.; Tiner, P.F.; Williams, J.K. Oak Ridge National Lab., TN (United States). Feb 1993. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93010256. Source: OSTI; NTIS; INIS; GPO Dep.

A surface radiological investigation at the ^{137}Cs- and ^{60}Co-contaminated forest area (Chestnut Ridge east and west plots) was conducted from January 1992 through August 1992. Results of the survey revealed numerous spots and small areas of surface contamination that followed the original placement of feeders used for ^{60}Co- and ^{137}Cs-labeled seeds in a 1969–1970 study. Surface gamma exposure rates reached 380 μR/h at the east plot and 400 μR/h at the west plot, but approximately one-half and one- third, respectively, of the identified anomalies did not exceed 39 μR/h. Results of soil sample analyses demonstrated that ^{137}Cs and ^{60}Co were responsible for the elevated radiation levels. Radionuclides were found below the surface at soil sample locations, in some cases at depths below 18 in. The same pattern of subsurface contamination may be present at other elevated surface spots at both plots. These survey results show that current radiological conditions at the site remain an environmental problem. Recommendations for corrective actions are included.

24765 (ORNL/FTR–4194) **Travel to Karlsruhe, Germany to exchange information on the in situ destruction of volatile organic compounds: Foreign trip report, February 10–16, 1992.** Siegrist, R.L. Oak Ridge National Lab., TN (United States). 16 Mar 1992. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011104. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The objective of the detailed trip was to meet with researchers at the University of Karlsruhe and their private industry partners to discuss and to exchange information on the in situ destruction of volatile organic compounds and to refine a project plan for the DOE International Technology Exchange Program (ITEP).

24766 (ORNL/FTR–4208) **The initiation of an environmental restoration project incorporating the bidirectional (US-Germany) transfer of environmental management technologies: Foreign trip report, February 23–29, 1992.** Faison, B.D. Oak Ridge National Lab., TN (United States). 16 Mar 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011105. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended meetings at Rossendorf to formalize a cooperative agreement with Ogden Environmental and Energy Services, Inc. (a US company) aimed at the restoration of sites contaminated by uranium milling activities near Crossen. Technologies developed at ORNL to be implemented in the restoration were described, with emphasis on biosorption for removal of dissolved uranium from tailings ponds. The goals of the International Technology Exchange Program, which funds ORNL's participation, and MMES were explained. Organizational ties were established with WISMUT and STEAG, the site operators. German technologies relevant to the uranium fuel cycle and/or the restoration of US sites were reviewed. Cooperation with three German national laboratories – Rossendorf (ZFK), Karlsruhe (KFK), and Leipzig-Halle (UFZ)– was initiated. A meeting was held at the demonstration site at Crossen to exchange technical data, followed by a tour of the site.

24767 (ORNL/FTR–4258) **Travel to Sweden, Denmark, and Norway to and participate in the international symposium on experimental manipulations of biota and biogeochemical cycling in ecosystems: Foreign trip report, May 16–24, 1992.** Turner, R.S. Oak Ridge National Lab., TN (United States). 3 Jun 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011081. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler presented a paper "A Large-Scale Throughfall Manipulation Experiment on Walker Branch Watershed" at the International Symposium on Experimental Manipulations of Biota and Biogeochemical Cycling in Ecosystems. The workshop-format meeting was sponsored by the Directorate-General for Science, Research, and Development of the Commission of the European Communities. The aim of the symposium was to present and review the major ongoing studies of manipulations of ecosystems in Europe and around the world.

24768 (ORNL/FTR–4397) **[Travel to Finland for a review of the carbon balance of peatlands and climate change project]: Foreign trip report, September 26, 1992–October 3, 1992.** Trettin, C.C. Oak Ridge National Lab., TN (United States). 19 Oct 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012120. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This is a trip report by an ORNL researcher. The purpose of the trip was to participate in a review of the Carbon Balance of Peatlands and Climate Change Project, which is a component of the Finnish National Program on Climate Change.

24769 (ORNL/FTR–4441) **[International Geosphere-Biosphere Program workshop on global soils data]: Foreign trip report, October 5–10, 1992.** Emanuel, W.R. Oak Ridge National Lab., TN (United States). 26 Oct 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93009929. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Soils are an important component of the climate system and global biogeochemical cycles and affect the responses of these systems to fossil fuel use and other human activities. I traveled to England to participate in a workshop, organized by the Data and Information System of the International Geosphere-Biosphere Program, to develop plans for a global soils data base for modeling and analysis of the earth systems involved in global environmental change. The workshop identified data needs and availability and prepared a plan for a pilot data project that will be implemented in about one year. I also visited the Rothamsted Experimental Station to review long-term data on dead organic matter and models of

dead organic matter turnover that can be incorporated into global carbon cycle models for analyzing changes in atmospheric CO_2.

24770 (ORNL/FTR–4562) **[Workshops concerning environmental carbon dioxide and terrestrial carbon]: Foreign trip report, February 27–March 6, 1993.** Wright, L.L.; Luxmoore, R.J. Oak Ridge National Lab., TN (United States). 1 Apr 1993. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011817. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The travelers each presented an invited paper at the workshop, peer reviewed several manuscripts that were provided by participants, and participated in two of eight work groups. The work groups and the invited presentations were focused on global terrestrial ecosystems from tundra to tropical, as well as potential approaches for mitigating rising atmospheric carbon dioxide through agricultural and forestry practices. The workshop efforts were broad ranging and included policy implications of the scientific findings. Summaries of selected presentations of particular interest are provided along with an outline of the scientific synthesis findings and policy implications from the eight work groups. The prepared papers from participants and synthesis reports will be published in a special issue of the journal Water, Air and Soil Pollution. These proceedings will be of value to the US Department of Energy programs in Carbon Dioxide Research and Biofuels Systems. The findings from the workshop will be offered to the InterGovernmentalPanel on Climate Change.

24771 (ORNL/M–1759) **Environmental surveillance data report for the third quarter of 1992.** Goldberg, P.Y.; Cooper, R.C.; Hamilton, L.V.; Hughes, J.F.; Horwedel, B.M.; Loffman, R.S.; Salmons, M.C.; Stevens, M.M.; Valentine, C.K. Oak Ridge National Lab., TN (United States). Feb 1993. 139p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93008984. Source: OSTI; NTIS; GPO Dep.

The Environmental Surveillance and Protection Section within the Office of Environmental Compliance and Documentation at the Oak Ridge National Laboratory (ORNL) is responsible for the development and implementation of an environmental program to (1) ensure compliance with all federal, state, and Department of Energy (DOE) reporting requirements to quantitatively demonstrate prevention, control, and abatement of environmental pollution; (2) monitor the adequacy of containment and effluent controls; and (3) assess impacts of releases from ORNL facilities on the environment. Environmental monitoring, as defined by the Regulatory Guide, consists of two major activities: effluent monitoring and environmental surveillance. Effluent monitoring is the collection and analysis of samples or measurements of liquid and gaseous effluents. Monthly or quarterly summaries are presented in this report for each medium sampled.

24772 (ORNL/RASA–92/14) **Results of the radiological survey at the former Alba Craft Laboratory site properties, Oxford, Ohio (OXO001).** Murray, M.E.; Brown, K.S.; Mathis, R.A. Oak Ridge National Lab., TN (United States). Mar 1993. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93010257. Source: OSTI; NTIS; INIS; GPO Dep.

At the request of the US Department of Energy (DOE), a team from Oak Ridge National Laboratory conducted a radiological survey at the former Alba Craft Laboratory Site Properties, Oxford, Ohio. The survey was performed in July and September of 1992. The purpose of the survey was to determine whether the property was contaminated with radioactive residues, primarily ^{238}U, from uranium machining operations conducted for National Lead of Ohio, a prime Atomic Energy Commission contractor. The survey included scan measurement of direct radiation levels inside and outside the former laboratory, outdoors on eight properties adjoining the former laboratory, and the city right-of-way adjacent to the surveyed properties. Radionuclide concentrations were determined in outdoor surface and subsurface soil samples taken from each property and the exterior of the laboratory. Fixed surface residual radioactivity was measured inside the laboratory and outside the building. Air samples were collected, direct exposure was measured, and samples were collected to measure transferable radioactivity inside the building. Results of the survey indicate areas where surface and soil contamination level s are above the DOE guidelines for uncontrolled areas.

24773 (ORNL/TM–12226) **Potential effect of natural gas wells on alluvial groundwater contamination at the Kansas City Plant.** Pickering, D.A. (Oak Ridge National Lab., TN (United States)); Laase, A.D.; Locke, D.A. Oak Ridge National Lab., TN (United States). May 1993. 128p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93013455. Source: OSTI; NTIS; INIS; GPO Dep.

This report is the result of a request for further information about several abandoned natural gas wells at the US Department of Energy's Kansas City Plant (KCP). The request was prompted by an old map showing several, possibly eight, natural gas wells located under or near what is now the southeast corner of the Main Manufacturing Building at KCP. Volatile organic compound contamination in the alluvial aquifer surrounding the gas wells might possibly contaminate the bedrock aquifer if the gas wells still exist as conduits. Several circumstances exist that make it doubtful that contamination is entering the bedrock aquifers: (1) because regional groundwater flow in the bedrock beneath the KCP is expected to be vertically upward, contaminants found in the alluvial aquifer should not migrate down the old wells; (2) because of the low hydraulic conductivity of the bedrock units, contaminant transport would be extremely slow if the contaminants were migrating down the wells; and (3) casing, apparently set through the alluvium in all of the wells, would have deteriorated and may have collapsed; if the casing collapsed, the silty clays in the alluvium would also collapse and seal the well. No definitive information has been discovered about the exact location of the wells. No further search for or consideration of the old gas wells is recommended.

24774 (PNL–8485) **Savage Island Project borehole completion report.** Chamness, M.A.; Gilmore, T.J.; Teel, S.S. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 347p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93009083. Source: OSTI; NTIS; INIS; GPO Dep.

Most of the report is handwritten manuscript.

This report discusses three wells which were drilled in 1990 and 1991 in support of Pacific Northwest Laboratory's Ground-Water surveillance Project. These wells were intended to monitor the Rattlesnake Ridge interbed aquifer and the deeper portion of the unconfined aquifer to determine whether ground-water contamination emanating from the Hanford Site was migrating offsite through these aquifers. This report discusses well construction, lithologies encountered, and other data collected during drilling. At least three reports have been or are being prepared to discuss the results of this well monitoring project.

24775 (PNL–8506) **Arid Lands Ecology Facility management plan.** Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93008628. Source: OSTI; NTIS; GPO Dep.

The Arid Lands Ecology (ALE) facility is a 312-sq-km tract of land that lies on the western side of the Hanford Site in southcentral Washington. The US Atomic Energy Commission officially set aside this land area in 1967 to preserve shrub-steppe habitat and vegetation. The ALE facility is managed by Pacific Northwest Laboratory (PNL) for the US Department of Energy (DOE) for ecological research and education purposes. In 1971, the ALE facility was designated the Rattlesnake Hills Research Natural Area (RNA) as a result of an interagency federal cooperative agreement, and remains the largest RNA in Washington. it is also one of the few remaining large tracts of shrub-steppe vegetation in the state retaining a predominant preeuropean settlement character. This management plan provides policy and implementation methods for management of the ALE facilities consistent with both US Department of Energy Headquarters and the Richland Field Office decision (US Congress 1977) to designate and manage ALE lands as an RNA and as a component of the DOE National Environmental Research Park System.

24776 (PNL–8532) **Environmental surveillance master sampling schedule.** Bisping, L.E. Pacific Northwest Lab., Richland,

WA (United States). Jan 1993. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93008626. Source: OSTI; NTIS; GPO Dep.

Environmental surveillance of the Hanford Site and surrounding areas is conducted by the Pacific Northwest Laboratory (PNL) for the US Department of Energy (DOE). Samples are routinely collected and analyzed to determine the quality of air, surface water, ground water, soil, sediment, wildlife, vegetation, foodstuffs, and farm products at Hanford Site and surrounding communities. This document contains the planned schedule for routine sample collection for the Surface Environmental Surveillance Project (SESP) and Drinking Water Project, and Ground-Water Surveillance Project.

24777 (PNL-SA–20740) **Engineering scaleup of electrical soil heating for soil decontamination.** Heath, W.O.; Roberts, J.S.; Lessor, D.E.; Bergsman, T.M. Pacific Northwest Lab., Richland, WA (United States). Aug 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920851–86: Spectrum '92: nuclear and hazardous waste management international topical meeting, Boise, ID (United States), 23-27 Aug 1992). Order Number DE93007870. Source: OSTI; NTIS; GPO Dep.

The objective of PNL's efforts in electrically based methods for environmental restoration is to provide new and cost-effective means for removing hazardous organic contaminants from soils, and to detoxify those contaminants after they are removed. Recent work has concentrated on two areas: electrical soil heating to remove volatile and semivolatile compounds from soils, and in situ oxidation via a form of low-temperature plasma to decompose nonvolatile and bound contaminants. This paper covers only the electrical soil heating component, and describes recent efforts to model the heating process to enable equipment and energy requirements to be specified. An initial field test of the heating process suggests that the model presented in this paper is correct, within the range of uncertainty in the spatial variations of soil properties. Because of page limitations, a description of this test and discussion of the test results will be relegated to a subsequent publication.

24778 (PNL-SA–20853) **The In Situ Vitrification Integrated Program: Focusing an innovative solution on environmental restoration needs.** Buelt, J.L.; Thompson, L.E. Pacific Northwest Lab., Richland, WA (United States). Aug 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920851–88: Spectrum '92: nuclear and hazardous waste management international topical meeting, Boise, ID (United States), 23-27 Aug 1992). Order Number DE93008915. Source: OSTI; NTIS; GPO Dep.

The objective of the In Situ Vitrification (ISV) Integrated Program is to ensure that ISV is a viable alternative for DOE environmental restoration applications. The program focuses ISV development activities upon DOE-wide environmental remediation needs and resolves issues inhibiting timely implementation on DOE sites. currently the ISV Integrated Program is focused on contaminated soil sites but is also resolving some key issues that are common to soils and to potential future applications such as buried waste and underground structures. This paper describes the status and current focus of the ISV Integrated Program.

24779 (PNL-SA–20985) **Poster session: Integrated demonstration for remediation of volatile organic compounds at arid sites.** Stein, S.L. (Pacific Northwest Lab., Seattle, WA (United States)). Pacific Northwest Lab., Richland, WA (United States). Aug 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920851–89: Spectrum '92: nuclear and hazardous waste management international topical meeting, Boise, ID (United States), 23-27 Aug 1992). Order Number DE93008990. Source: OSTI; NTIS; GPO Dep.

The Integrated Demonstration for Cleanup of Volatile Organic Compounds (VOC-Arid ID) was initiated by the US Department of Energy (DOE) to accelerate the process for developing, evaluating, and deploying technology for cleaning up VOCs and other hazardous constituents in and environments. Over the next few years, the ID will focus on technologies for characterization and monitoring through treatment and closure. This paper describes the problem that is being addressed by the VOC-Arid ID, the host site, interaction with the end users of the ID's technologies, specific technologies that make up the ID, links with industry, and the ID's schedule.

24780 (PNL-SA–21537) **Field test of Six-Phase Soil Heating and evaluation of engineering design code.** Bergsman, T.M.; Roberts, J.S.; Lessor, D.L.; Heath, W.O. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930205–34: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93009477. Source: OSTI; NTIS; INIS; GPO Dep.

A field test was conducted to evaluate the performance of Six-Phase Soil Heating to enhance the removal of contaminants. The purpose of the test was to determine the scale-up characteristics of the Six-Phase Soil Heating technology and to evaluate a computer process simulator developed for the technology. The test heated a 20-ft diameter cylinder of uncontaminated soil to a 10-ft depth. Six-phase ac power was applied at a rate of 30–35 kW using a power system built from surplus electrical components. The test ran unattended, using a computer-based system to record data, alert staff of any excursions in operating conditions via telephone, and provide automatic shut-off of power depending on the type of excursion. The test data included in situ soil temperatures, voltage profiles, and moisture profiles (using a neutron-probetechnique). After 50 days of heating, soil in the center of the array at the 6-ft depth reached 80°C. Soil temperatures between the two electrodes at this depth reached approximately 75°C. Data from this test were compared with those predicted by a computer process simulator. The computer process simulator is a modified version of the TOUGH2 code, a thermal porous media code that can be used to determine the movement of air and moisture in soils. The code was modified to include electrical resistive heating and configured such that an application could be run quickly on a workstation (approximately 5 min for 1 day of field operation). Temperature and soil resistance data predicted from the process simulations matched actual data fairly closely. A series of parametric studies was performed to assess the affect of simulation assumptions on predicted parameters.

24781 (PNL-SA–21710) **Tunable hybrid plasma decomposition of dilute concentrations of CC14 in air.** Truex, M.J. (Pacific Northwest Lab., Richland, WA (United States)); Bromberg, L.; Cohn, D.R.; Koch, M.; Patrick, R.M.; Thomas, P. Pacific Northwest Lab., Richland, WA (United States). Jan 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930160–7: 2. semi-annual Office of Technology Development (OTD) information meeting, Houston, TX (United States), 26-28 Jan 1993). Order Number DE93007993. Source: OSTI; NTIS; GPO Dep.

At the Department of Energy Hanford site, a large quantity of the industrial solvent carbon tetrachloride (CC14) was used and subsequently disposed of in leaching fields. Efforts under the Volatile Organic Compound - Arid Integrated Demonstration Program (VOC-Arid ID) are directed at vapor extraction of carbon tetrachloride from the ground and its subsequent decomposition in the contaminated humid air stream. We are developing a mobile electron-beam driven plasma reactor for versatile efficient on-site decomposition of CC14 and other VOCs in carrier gases at atmospheric pressure. The decomposition of the VOCs could result in the generation of CO_2, light hydrocarbons, and reactive chlorine compounds. The latter dissolve and/or dissociate in aqueous solutions.

24782 (PNL-SA–21865) **Implementing and operating the Hanford Environmental Information System and applying it to the carbon tetrachloride expedited response action.** Cowley, P.J. (Pacific Northwest Lab., Richland, WA (United States)); Last, G.V.; Schwab, M.R.; Rohay, V.J. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930205–45: Waste management '93, Tucson, AZ (United States), 28 Feb - 4 mar 1993). Order Number DE93009810. Source: OSTI; NTIS; INIS; GPO Dep.

To manage waste and perform environmental monitoring and restoration at the 1450-square kilometer (560-square mile) Hanford Site in southeastern Washington State, vast amounts of scientific

and technical data are being generated from sampling. This paper provides an overview of the Hanford Environmental Information System (HEIS), a computerized system designed and implemented to manage the Site's environmental sampling data, lessons learned from putting HEIS into operation, and how HEIS is being applied to the carbon tetrachloride expedited response action being performed at the Site.

24783 (PNL-SA–22251) **Environmental restoration using plant-microbe bioaugmentation.** Kingsley, M.T.; Fredrickson, J.K.; Metting, F.B.; Seidler, R.J. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930482–6: 2. international symposium in situ and on-site bioreclamation, San Diego, CA (United States), 5-8 Apr 1993). Order Number DE93013160. Source: OSTI; NTIS; INIS; GPO Dep.

Land farming, for the purpose of bioremediation, refers traditionally to the spreading of contaminated soil, sediments, or other material over land; mechanically mixing it; incorporating various amendments, such as fertilizer or mulch; and sometimes inoculating with degradative microorganisms. Populations of bacteria added to soils often decline rapidly and become metabolically inactive. To efficiently degrade contaminants, microorganisms must be metabolically active. Thus, a significant obstacle to the successful use of microorganisms for environmental applications is their long-term survival and the expression of their degradative genes in situ. Rhizosphere microorganisms are known to be more metabolically active than those in bulk soil, because they obtain carbon and energy from root exudates and decaying root matter. Rhizosphere populations are also more abundant, often containing 10^8 or more culturable bacteria per gram of soil, and bacterial populations on the rhizoplane can exceed 10^9/g root. Many of the critical parameters that influence the competitive ability of rhizosphere bacteria have not been identified, but microorganisms have frequently been introduced into soil (bioaugmentation) as part of routine or novel agronomic practices. However, the use of rhizosphere bacteria and their in situ stimulation by plant roots for degrading organic contaminants has received little attention. Published studies have demonstrated the feasibility of using rhizobacteria (Pseudomonas putida) for the rapid removal of chlorinated pesticides from contaminated soil, and to promote germination of radish seeds in the presence of otherwise phytotoxic levels of the herbicide 2,4-dichlorophenoxyacetic acid (2,4-D), and phenoxyacetic acid (PAA). The present investigation was undertaken to determine if these strains (Pseudomonas putida PPO301/pRO101 and PPO301/pRO103) could be used to bioremediate 2,4-D-amended soil via plant-microbe bioaugmentation.

24784 (POEF/ER/Sub–88/4551/D1-Vol.3) **Quadrant III RFI draft report: Appendix B-I, Volume 3.** Portsmouth Gaseous Diffusion Plant, OH (United States); Geraghty and Miller, Inc., Dublin, OH (United States). Environmental Services. Dec 1992. 705p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-76OR00001. Order Number DE93007780. Source: OSTI; NTIS; INIS; GPO Dep.

In order to determine the nature and extent of contamination at a RCRA site it is often necessary to investigate and characterize the chemical composition of the medium in question that represents background conditions. Background is defined as current conditions present at a site which are unaffected by past treatment, storage, or disposal of hazardous waste (OEPA, 1991). The background composition of soils at the Portsmouth Gaseous Diffusion Plant (PORTS) site was characterized for the purpose of comparing investigative soil data to a background standard for each metal on the Target Compound List/Target Analyte List and each radiological parameter of concern in this RFI. Characterization of background compositions with respect to organic parameters was not performed because the organic parameters in the TCL/TAL are not naturally occurring at the site and because the site is not located in a highly industrialized area nor downgradient from another unrelated hazardous waste site. Characterization of the background soil composition with respect to metals and radiological parameters was performed by collecting and analyzing soil boring and hand-auger samples in areas deemed unaffected by past treatment, storage, or disposal of hazardous waste. Criteria used in determining whether a soil sample location would be representative of the true background condition included: environmental history of the location, relation to Solid Waste Management Units (SWMU's), prevailing wind direction, surface runoff direction, and ground-water flow direction.

24785 (POEF/ER/Sub–88/4551/D1-Vol.4) **Quadrant III RFI draft report: Appendix J, Baseline risk assessment: Volume 4.** Portsmouth Gaseous Diffusion Plant, OH (United States); Geraghty and Miller, Inc., Dublin, OH (United States). Environmental Services. Dec 1992. 937p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-76OR00001. Order Number DE93007781. Source: OSTI; NTIS; INIS; GPO Dep.

In accordance with the Risk Assessment Guidance for Superfund (U. S.EPA 1989), which states that background risk should be calculated separately from site-related risk in order to provide important information to the risk manager, this appendix assesses the human health risks associated with background levels of naturally occurring compounds in soil at the Portsmouth Gaseous Diffusion Plant (PORTS). This appendix is organized as follows: Background Conditions, in which the results of Geraghty & Miller's work on characterizing background levels of naturally occurring compounds in soils is summarized; Identification of Exposure Pathways; Estimation of Environmental Concentrations; Estimation of Human Intake; Toxicity Assessment, and Risk Characterization, in which numerical estimates of carcinogenic and noncarcinogenic risk are calculated for each naturally occurring compound and potential exposure pathway.

24786 (UBA-FB–92-104) **Heavy metals and other pollutants in fertilizers. Literature evaluation and analyses.** Umweltbundesamt - Texte. Boysen, P. Landwirtschaftskammer Schleswig-Holstein, Kiel (Germany). Landwirtschaftliche Untersuchungs- und Forschungsanstalt (LUFA); Umweltbundesamt, Berlin (Germany). Dec 1992. 106p. (In German). Contract UFOPLAN 10701016/01. Order Number DE93795277. Source: OSTI; NTIS (US Sales Only).

As part of the research and development project, two papers were prepared on heavy metals in fertilizers and on organic pollutants in fertilizers. In addition, about 10.000 fertilizer analyses were carried out for heavy metals and other anorganic pollutants. The details from the bibliography and the new analyses produced only partial agreement. When evaluating the results, the pollutant contents are displayed according to the types of fertilizer. From the total fertilizer consumption and the pollutant contents, it was possible to compute the average pollutant load. In addition, balance sheets were drawn up for special agricultural or gardening usage and fertilizer systems. (orig.) With 13 refs., 30 tabs.

24787 (UCID–21536-Add.2) **Logs of wells and boreholes drilled during hydrogeologic studies at Lawrence Livermore National Laboratory Site 300, January 1, 1991–September 1, 1992: Addendum 2.** Crow, N.B. (Lawrence Livermore National Lab., CA (United States)); McConihe, W.L. Lawrence Livermore National Lab., CA (United States). 1992. 440p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93008622. Source: OSTI; NTIS; INIS; GPO Dep.

Lawrence Livermore National Laboratory (LLNL) Site 300 is located in the Altamont Hills between Livermore and Tracy, about 18 road miles southeast of Livermore, California. The site is used as a test facility to support national defense research carried out by LLNL. This Addendum 2 to the Logs of Wells and Boreholes Drilled During Hydrogeologic Studies at Lawrence Livermore National Laboratory Site 300 presents hydrogeologic logs for monitor wells and boreholes drilled primarily between January 1, 1991 and September 1, 1992. Some logs drilled earlier and not incorporated in earlier volumes of this document are also included here. A small number of logs drilled before September 1, 1992, are not available at the time of closing the report for publication of this volume (Addendum 2), but will be included in subsequent documents. By September 1, 1992, a total of 495 monitor wells and 285 exploratory boreholes had been drilled at Site 300 since the beginning of hydrogeologic studies in 1982. The primary purpose of these logs is to document lithologic and hydrogeologic conditions together with well completion information. For this reason, not all

chemical analytical data are presented. These logs report concentrations of only the most commonly encountered volatile organic compounds, trace metals, and radionuclides detected in ground water and soil samples collected during drilling.

24788 (UCRL-ID–108524) **Gamma-ray and surface organic results of the robotic survey of Pit 9 at INEL: Technical evaluations report for work done at the raiological waste management complex at the Idaho National Engineering Laboratory, Summer, 1991.** Clegg, B. (Science Applications International Corp., Pleasanton, CA (United States)); Rowland, M.; Pence, J. Lawrence Livermore National Lab., CA (United States). Sep 1991. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93013103. Source: OSTI; NTIS; INIS; GPO Dep.

The Buried Waste Robotics Program demonstrated and evaluated robotic techniques to non-invasively characterize a representative radiological burial area at the Idaho National Engineering Laboratory (ML). Lawrence Livermore National Laboratory (LLNL) contributed a large, NaI gamma-ray detector system and a photoionization organics detector to this program. This Program mounted multiple geophysics, nucleonic, and chemical sensor systems on the Solder Robot Interface Program (SRIP) remotely operated vehicle. These sensors simultaneously collected radiological waste-site, surface characterization data on Pit 9 radiological burial area, and the Cold Test Pit (CTP), off-site control area. LLNL sensors found no radiological waste at the CTP control area, however, we easily detected the natural thorium series, the potassium radionuclides and trace worldwide fallout cesium. Earlier manual measurements indicated no significant data error invoked by the vehicle on our gamma-ray and organic sensor systems. Thick soil overburden at the Subsurface Disposal Area (SDA), Pit 9, permitted radiological, but no isotopic determinations. A flood of scattered photons from the buried waste allows a surface, spatial radiological dose assessment. We found no evidence of surface-evolving organics, sensitive to photo-ionization detection. The observed signals can safely guide a remediation excavation. The vehicle-supported multiple measurements enhanced the data collection efficiency. Data provided site-surface characterization, quickly and safely in potentially hazardous areas. However, a large, buried-waste site will require subsurface access for detailed characterization.

24789 (UCRL-ID–111013) **Underground radionuclide migration at the Nevada Test Site.** Nimz, G.J. (Lawrence Livermore National Lab., CA (United States)); Thompson, J.L. Lawrence Livermore National Lab., CA (United States). 22 Jun 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93009450. Source: OSTI; NTIS; INIS; GPO Dep.

This document reviews results from a number of studies concerning underground migration of radionuclides from nuclear test cavities at the Nevada Test Site (NTS). Discussed are all cases known to the Department of Energy's Hydrology and Radionuclide Migration Program where radionuclides have been detected outside of the immediate vicinity of nuclear test cavities that are identifiable as the-source of the nuclides, as well as cases where radionuclides might have been expected and were intentionally sought but not fixed. There are nine locations where source-identifiable radionuclide migration has been detected, one where migration was purposely induced by pumping, and three where migration might be expected but was not found. In five of the nine cases of non-induced migration, the inferred migration mechanism is prompt fracture injection during detonation. In the other four cases, the inferred migration mechanism is water movement. In only a few of the reviewed cases can the actual migration mechanism be stated with confidence, and the attempt has been made to indicate the level of confidence for each case. References are cited where more information may be obtained. As an aid to future study, this document concludes with a brief discussion of the aspects of radionuclide migration that, as the present review indicates, are not yet understood. A course of action is suggested that would produce a better understanding of the phenomenon of radionuclide migration.

24790 (UCRL-JC–106541) **Treatment of ground water contaminated with volatile organic compounds using second generation ultraviolet light technology.** Lyandres, S.E. (Amrutech, Inc., Berkeley, CA (United States)); Rees, J.T.; Folsom, E.N.; Boegel, A.J. Lawrence Livermore National Lab., CA (United States). Mar 1991. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9104215–3: HAZMACON '91, Santa Clara, CA (United States), 16-18 Apr 1991). Order Number DE93010508. Source: OSTI; NTIS; INIS; GPO Dep.

Pilot tests, using a second generation ultraviolet (UV) light technology, were run on ground water samples taken f rom two separate aquifers contaminated with volatile organic compounds (VOCS) at the Lawrence Livermore National Laboratory (LLNL) in Alameda County, California. The VOCs included gasoline, TCE, and 1,2-DCA. VOC concentrations in the ground water ranged from 11 to 1,000 ppB. Discharges of treated ground water at LLNL are not to exceed 5 ppb total VOCs under a Federal National Pollution Discharge Elimination System discharge permit. Test results indicated that double-bonded VOCS, including aromatic compounds and TCE, were decomposed quickly and efficiently to low or non-detectable levels (<0.5 ppB, analyzed with a gas chromatograph). An equivalent level of degradation for 1,2-DCA required a moderately higher UV energy input and greater concentrations of additives. Concentrations of peroxide tested ranged between 10 and 60 ppM; however, those above 30 ppM did not significantly increase the rate of VOC destruction.

24791 (UCRL-JC–109508) **An evaluation of a teleoperated waste-site survey technique.** Rowland, M. (Lawrence Livermore National Lab., CA (United States)); Pence, J.; Clegg, B. Lawrence Livermore National Lab., CA (United States); Science Applications International Corp., Pleasanton, CA (United States). 22 Jun 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920606–45: American Nuclear Society annual meeting, Boston, MA (United States), 7-12 Jun 1992). Order Number DE93012582. Source: OSTI; NTIS; INIS; GPO Dep.

The efficacy of teleoperated gamma-ray and vapor sensors was tested for the timely, non-invasive characterization of buried radiological waste before its removal. Conventional nucleonics and chlorinated vapor sensors were adapted for a teleoperated vehicle that functioned as a remote sensor and a characterization system. Radiological and chemical data were collected at the Idaho National Engineering Laboratory (INEL) on the Radioactive Waste Management Complex (RWMC) and we found that the method fell short on specific characterization. Soil overburden accounts for this shortfall as this overburden intentionally shields hazards as well as needed detailed characterization data. A simple, gamma-transport calculation based on our RWMC data indicates that the remaining sensor signatures are sufficient to supply radiosource size and isotope types during site remediation.

24792 (UCRL-JC–110055) **Monitoring remediation of trichloroethylene using a chemical fiber optic sensor: Field studies.** Colston, B. Jr.; Brown, S.B.; Langry, K.; Daley, P.; Milanovich, F.P. Lawrence Livermore National Lab., CA (United States). May 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920851–90: Spectrum '92: nuclear and hazardous waste management international topical meeting, Boise, ID (United States), 23-27 Aug 1992). Order Number DE93009284. Source: OSTI; NTIS; INIS; GPO Dep.

Field tests of a remote fiber optic chemical sensor have recently been completed. The sensor has measured trace quantities of organohalides in the vadose zone and groundwater. Due to its toxicological importance and accessibility, a specific contaminant monitored was trichloroethylene (TCE). Two elements considered in these field measurements included temperature and carbon dioxide (CO_2) fluctuations. The effects of these properties on the sensor have been modeled in the lab. These results were used in the final determination of TCE concentration. Department of Energy (DOE) sites where remediation work is in progress provided opportunities for testing the sensor. One test was conducted in the vadose zone over sampling wells at the Savannah River Plant DOE integrated test site. Measurements were made before and several months after remediation procedures were in progress. A

series of wells was selected with discretely screened depth intervals. Data were collected over a range of depths. A second set of experiments took place at Lawrence Livermore Site 300, in collaboration with a private company (Purus). Purus is remediating groundwater contaminated with halogenated volatile organic compounds. The sensor was set up to continuously monitor the processed gas stream. Supporting data were provided in this case with side by side gas chromatograph measurements.

24793 (UCRL-JC–110235) **Enhancing aquifer cleanup with reinjection.** Isherwood, W.F. (Lawrence Livermore National Lab., CA (United States)); Ziagos, J.; Rice, D. Jr.; Krauter, P.; Nichols, E. Lawrence Livermore National Lab., CA (United States). Sep 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9211208–1: National Ground Water Association (NGWA) meeting, Houston, TX (United States), 4-6 Nov 1992). Order Number DE93009249. Source: OSTI; NTIS; INIS; GPO Dep.

Injection of water or steam, with or without chemical surfactants, is a common petroleum industry technique to enhance product recovery. In the geothermal industry, reinjection (reinjection is used to mean the injection of ground water that was previously injected) of heat- depleted subsurface fluids is commonly used to maintain reservoir pressure, thus prolonging field productivity. The use reinjection in ground-water remediation projects allows for the application of both traditional production field management and a variety of additional enhancements to the cleanup process. Development of the ideas in this paper was stimulated by an initial suggestion by Dr. Jacob Bear (personal discussions, 1990–1991) that reinjected water might be heated to aid the desorption process.

24794 (UCRL-JC–110353) **Overview of the Dynamic Underground Stripping demonstration project.** Aines, R. (Lawrence Livermore National Lab., CA (United States)); Newmark, R.; McConachie, W.; Rice, D.; Ramirez, A.; Siegel, W.; Buettner, M.; Daily, W.; Krauter, P.; Folsom, E.; Boegel, A.J.; Bishop, D.; Udell, K. Lawrence Livermore National Lab., CA (United States). Aug 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920851–94: Spectrum '92: nuclear and hazardous waste management international topical meeting, Boise, ID (United States), 23-27 Aug 1992). Order Number DE93012477. Source: OSTI; NTIS; GPO Dep.

Dynamic Underground Stripping is a limited-scope demonstration of a system of thermal remediation and underground imaging techniques for use in rapid cleanup of localized underground spills. Called "Dynamic Stripping" to reflect the rapid and controllable nature of the process, it combines steam injection, direct electrical heating, and tomographic geophysical imaging in a cleanup of the LLNL gasoline spill. The system is targeted toward the removal of free-phase organics of all kinds. The LLNL gasoline spill is a convenient test site because much of the gasoline has been trapped below the water table, mimicking the behavior of dense organic liquids.

24795 (UCRL-JC–110525) **Characterization of ground water contamination at the LLNL main site: A case study.** Hoffman, F. Lawrence Livermore National Lab., CA (United States). Jul 1992. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9209159–7: Eurocourse: technologies for environmental cleanup - soil and groundwater, Ispra (Italy), 21-25 Sep 1992). Order Number DE93009291. Source: OSTI; NTIS; GPO Dep.

When volatile organic compounds were discovered in ground water on and off Lawrence Livermore National Laboratory (LLNL), an extensive investigation of the hydrogeology began in, around, and under the site. This investigation involved collection of data concerning the hydrology, geology, and chemistry of the subsurface environment. After a thorough analysis of the existing information, a workplan was devised that allowed the investigation to proceed with built in flexibility to respond to new data as it was acquired. Where the unique characteristics of the site required a different approach to hydrogeologic investigations, new and innovative technologies were developed and deployed, such as a drilling and sampling method designed to allow the evaluation of the vertical distribution of contaminants in a single borehole. As the data were collected, equal attention was paid to methods of storing, arranging, and interpreting the information such that our decision making was well supported. The result is a well-characterized, well instrumented site that can serve as a model for hydrogeologic investigations wherever there is ground water contamination.

24796 (UCRL-JC–110528) **Innovative characterization techniques and decision support systems for ground water contamination projects.** Hoffman, F. Lawrence Livermore National Lab., CA (United States). Jul 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9209159–4: Eurocourse: technologies for environmental cleanup - soil and groundwater, Ispra (Italy), 21-25 Sep 1992). Order Number DE93009252. Source: OSTI; NTIS; INIS; GPO Dep.

Ground water contamination projects throughout the world must be approached as individual and unique problems. Many traditional investigation techniques require modification to meet the needs of site-specific situations. Because the age of the science of contaminant hydrogeology can be measured only in a few decades, the field is ripe for innovation. This paper describes the following new technologies: At Lawrence Livermore National Laboratory (LLNL), we have developed a new drilling and sampling method, which allows the evaluation of the vertical extent of contamination in a single borehole. We are also using new fiber-optic-based chemical analytical sensors that promise to greatly increase the case of obtaining chemical analyses in the subsurface while greatly reducing costs. Because ground water investigations are data intensive, we need the best decision support system information tools to proceed with investigation and cleanup. These tools have three components: a relational database, data analysis tools, and tools for data display.

24797 (UCRL-JC–110530) **A strategy for improving pump and treat ground water remediation.** Hoffman, F. Lawrence Livermore National Lab., CA (United States). Jul 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9209159–6: Eurocourse: technologies for environmental cleanup - soil and groundwater, Ispra (Italy), 21-25 Sep 1992). Order Number DE93009239. Source: OSTI; NTIS; INIS; GPO Dep.

Established pump and treat ground water remediation has a reputation for being too expensive and time consuming, especially when cleanup standards are set at very low levels, e.g., <10 parts per billion (ppb) for volatile organic compounds (VOCs). Although other ground water remediation technologies are currently being examined and show intriguing promise, pump and treat remains the only dependable technology for cleanup of deep (i.e., >50 ft below ground surface) widespread ground water contamination. The perceived shortcomings of pump and treat result from the (1) tendency of most contaminants to sorb to formation materials, thus retarding contaminant removal; (2) geologic complexity, which requires detailed characterization for the design of optimal extraction systems within available resources; and (3) failure to apply dynamic well field management techniques. An alternative strategy for improving pump and treat ground water remediation consists of (1) detailed characterization of the geology, hydrology, and chemistry; (2) use of computer-aided data interpretation, data display, and decision support systems; (3) removal of sources, if possible; (4) initial design for plume containment and source remediation; (5) phased installation of the well field; (6) detailed monitoring of the remediation; (7) active ongoing re-evaluation of the operating well field, including redesign as appropriate (dynamic management); (8) re-injection of treated ground water to speed the flushing of contaminants; and (9) setting of appropriate cleanup levels or goals. Use of some or all of these techniques can dramatically reduce the time required to achieve cleanup goals and thus the cost of ground water remediation.

24798 (UCRL-JC–110622) **Environmental transport and human exposure: A multimedia approach in health-risk policy.** McKone, T.E. Lawrence Livermore National Lab., CA (United States). May 1992. 5p. Sponsored by USDOE, Washington, DC (United States); California State Government, Sacramento, CA (United States). DOE Contract W-7405-ENG-48. (CONF-9111295–1: Environmental research conference multimedia approach on integrated environmental protection, Toronto (Canada), 25-26 Nov

1991). Order Number DE93007501. Source: OSTI; NTIS; GPO Dep.

In his treatise Air, Water, and Places, the ancient-Greek physician Hippocrates demonstrated that the appearance of disease in human populations is influenced by the quality of air, water, and food; the topography of the land; and general living habits. This approach is still relevant and, indeed, the conerstone of modem efforts to relate public health to environmental factors. What has changed is the precision with which we can measure and model these long-held relationships. Environmental scientists recognize that plants, animals, and humans encounter environmental contaminants via complex transfers through air, water, and food and use multimedia models to evaluate these transfers. In this report, I explore the use of multimedia models both to examine pollution trends and as a basis for characterizing human health risks and ecological risks. The strengths and weaknesses of the approach are discussed.

24799 (UCRL-JC–110957) **The role of data management and decision support systems in the implementation of smart pump and treat.** Rice, D.W. Jr.; Boegel, A.J.; Johnson, V.M.; Cederwall, P.L.; Qualheim, B.J.; Johnson, R.R.; Aines, R.D.; Canales, T.W.; Ridley, M.N.; Nichols, E.M.; Ziagos, J.P. Lawrence Livermore National Lab., CA (United States). Mar 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9204121–4: Innovative technologies for cleaning the environment: air, water, and soil, Erice (Italy), 22-29 Apr 1992). Order Number DE93010513. Source: OSTI; NTIS; INIS; GPO Dep.

Smart pump and treat is made possible by recent advances in information processing that allow rapid analysis of massive volumes of data generated by environmental remediation activities. A critical element in smart pump and treat ;is the establishment of a decision support system that will allow the rapid interpretation of data so that informed decisions can be made at each succeeding step in the remedial process.

24800 (UCRL-JC–110959) **Technologies for environmental cleanup: Soil and ground water.** Ragaini, R.C. Lawrence Livermore National Lab., CA (United States). Jul 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9209159–5: Eurocourse: technologies for environmental cleanup - soil and groundwater, Ispra (Italy), 21-25 Sep 1992). Order Number DE93009513. Source: OSTI; NTIS; GPO Dep.

This is the first of a series of four EUROCOURSES that will be conducted under the title of "Technologies for Envirommental Cleanup." This first course will address the needs of today's environmental protection managers who must deal with the cleanup of soil and ground water contamination. It focuses on recent developments in the areas of policies and regulations, characterization. of.contaminants, subsurface transport and fate of contaminants, cleanup technologies, contaminant risk analysis, and cleanup strategies. Until the goal of acceptable cleanup is achieved, dissemination of information about available cleanup techniques is essential - through courses such as these developed by experts in the US and Europe especially for governmental and industrial managers throughout the world.

24801 (UCRL-JC–111786) **Use of three-dimensional, high-resolution seismic technology to optimize the location of remedial systems.** Bainer, R.W. (Lawrence Livermore National Lab., CA (United States)); Adams, M.L. Lawrence Livermore National Lab., CA (United States). Feb 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930257–2: 3. international symposium of field screening methods for hazardous wastes and toxic chemicals, Las Vegas, NV (United States), 24-26 Feb 1993). Order Number DE93009064. Source: OSTI; NTIS; INIS; GPO Dep.

Two three-dimensional (3-D), high-resolution seismic reflection pilot studies were conducted in California at two sites, where the primary contaminants of concern are solvents. Identify pathways of contaminant migration. Determine the subsurface stratigraphy and structure to optimize the location for placement of remedial systems. The geology at the first site, located at the Lawrence Livermore National Laboratory in Livermore, California, is characterized by unconsolidated alluvium. Ground water varies in depth from about 30 to 100 ft. The site typically is subjected to extensive cultural noise. The second site, in Southern California, is located in a broad, synclinal depression in the Transverse Range. Shallow alluvium overlies a marine turbidite sequence that crops out as massive sandstone beds. Field work for both surveys took place in August 1992. A Bison Model 90120-A, 120-channel (DIFP) seismograph was used to record the data. Thirty-hertz, natural-frequency geophones were used to receive the data, and an Elastic Wave Generator (EWG) was used as the seismic source. The use of a signal-stacking, noninvasive source was found to be an effective method of overriding background noise at the sites. Prior to the commencement of the 3-D pilot studies, a two-dimensional (2-D) profile was recorded to test the acquisition parameters, which included the geometry of the survey, digital sample rate, and analog filter settings. The data were monitored in the field with a Bison 486 Explorer outdoor computer. The 2-D data were processed and displayed in the field. Both sites displayed coherent seismic reflections from the depths of interest on the field-stacked sections.

24802 (UCRL-JC–112395) **Ultraviolet/hydrogen peroxide oxidation as an alternative to incineration for Rocky Flats combustible wastes.** Wang, F.; Lum, B.; Cassidy, K. Lawrence Livermore National Lab., CA (United States). Dec 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930160–12: 2. semi-annual Office of Technology Development (OTD) information meeting, Houston, TX (United States), 26-28 Jan 1993). Order Number DE93009226. Source: OSTI; NTIS; GPO Dep.

Ultraviolet/hydrogen peroxide (UV/H_2O_2) oxidation is an established technology, often used in groundwater remediation, where large volumes of effluent containing traces of organic contaminants are treated. With appropriate LTV wavelengths (200–250 mn), hydrogen peroxide undergoes photochemical decomposition by the UV light to produce OH· radicals that are capable of oxidizing many organic compounds. However, the treatment is generally considered acceptable if toxic organic compounds are only partially oxidized into nontoxic compounds. Recent work at LLNL and at Purus, Inc., San Jose, has focused on improving the efficiency of the process and achieving complete mineralization of all likely organic contaminants. In 1992, at EG&G's request we began an evaluation of the UV/H_2O_2 process as an alternative to incineration of Rocky Flats Plant low level combustible mixed wastes such as cutting oils (e.g. Trimsol) and cellulosic materials.

24803 (WHC-SA–1883) **The reduction of packaging waste.** Raney, E.A.; McCollom, M.; Hogan, J. Westinghouse Hanford Co., Richland, WA (United States). Apr 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930483–3: 9. waste minimization and pollution prevention conference, San Francisco, CA (United States), 13-15 Apr 1993). Order Number DE93012619. Source: OSTI; NTIS; GPO Dep.

Nationwide, packaging waste comprises approximately one third of the waste being sent to our solid waste landfills. These wastes range from product and shipping containers made from plastic, glass, wood, and corrugated cardboard to packaging fillers and wraps made from a variety of plastic materials such as shrink wrap and polystyrene peanuts. The amount of packaging waste generated is becoming an important issue for manufacturers, retailers, and consumers. Elimination of packaging not only conserves precious landfill space, it also reduces consumption of raw materials and energy, all of which result in important economic and environmental benefits. At the US Department of Energy-Richland Field Office's (DOE-RL) Hanford Site as well as other DOE sites the generation of packaging waste has added importance. By reducing the amount of packaging waste, DOE also reduces the costs and liabilities associated with waste handling, treatment, storage, and disposal.

24804 (WHC-SA–1896) **Environmental remediation of the 200 Areas, Hanford Site, Washington.** Johnson, W.L.; Wittreich, C.D. Westinghouse Hanford Co., Richland, WA (United States). Apr 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9304117–2: International waste management conference, San Juan (Puerto Rico), 28 Apr 1993). Order Number DE93012615. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Site, established in 1943, was originally designed, built, and operated to produce plutonium for nuclear weapons using production reactors and chemical reprocessing plants. Operations in the 200 Areas were mainly related to separation of special nuclear materials from spent nuclear fuel and contain related chemical and fuel processing and waste management facilities. Large quantities of chemical and radioactive waste associated with these processes were often disposed to the environment. This has resulted in extensive contamination in several types of environmental media including air, vadose zone, groundwater, surface water, ground surface, and biota. Efforts are currently underway to remediate chemical and nuclear processing areas of the Hanford Site. Because of the complexity and extent of environmental contamination that has resulted from decades of hazardous and radioactive waste disposal practices, an innovative approach to remediating the site was required. A comprehensive study, referred to as the 200 Aggregate Area Management Study (AAMS) Program, of waste disposal and environmental monitoring data with field investigations was conducted in 1992 to assess the scope of the remediation effort and to develop a plan to expedite the cleanup process.

24805 (WSRC-TR–92-510) **H-Area Seepage Basins groundwater monitoring report, third quarter 1992.** Westinghouse Savannah River Co., Aiken, SC (United States). Dec 1992. 534p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93012792. Source: OSTI; NTIS; GPO Dep.

During third quarter 1992, the groundwater at the H-Area Seepage Basins (HASB) was monitored in compliance with South Carolina Hazardous Waste Management Regulations, R61-79.265, Subpart F. One hundred thirty wells provided samples from the three separate hydrostratigraphic units that make up the uppermost aquifer beneath the HASB. A detailed description of the uppermost aquifer is included in the Resource Conservation and Recovery Act Part B Post-Closure Care Permit Application for the H-Area Hazardous Waste Management Facility submitted to the South Carolina Department of Health and Environmental Control in December 1990. Historically, as well as currently, tritium, nitrate, mercury, and gross alpha have been the primary constituents observed above the US Environmental Protection Agency Primary Drinking Water Standards (PDWS) in groundwater at the HASB. Nonvolatile beta has consistently exceeded its drinking water screening level. Other radionuclides and hazardous constituents also have exceeded the PDWS in the groundwater at the HASB. Isoconcentration maps included in this report indicate both the concentration and extent of the primary contaminants in each of the three hydrostratigraphic units. Water-level maps indicate that the groundwater flow rates and directions at the HASB have remained relatively constant since the basins ceased to be active in 1988.

24806 (WSRC-TR–92-511) **Mixed Waste Management Facility (MWMF) groundwater monitoring report: Third quarter 1992.** Thompson, C.Y. Westinghouse Savannah River Co., Aiken, SC (United States). Dec 1992. 757p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93012125. Source: OSTI; NTIS; GPO Dep.

During third quarter 1992, 12 constituents exceeded the US Environmental Protection Agency Primary Drinking Water Standards (PDWS) in one or more groundwater samples from monitoring wells at the Mixed Waste Management Facility and adjacent facilities. Tritium and trichloroethylene were the most widespread constituents: 57 (48%) and 23 (19%) of the 119 monitoring wells contained elevated tritium and trichloroethylene levels, respectively. Elevated constituents were found primarily in Aquifer Zone IIB_2 (Water Table) and Aquifer Zone IIB_1 (Barnwell/McBean). Elevated constituents also occurred in five Aquifer Unit IIA (Congaree) wells. Upgradient wells BGO 1D and 2D and HSB 85A, 85B, and 85C did not contain any constituents that exceeded the PDWS. Downgradient wells in the three hydrostratigraphic units contained elevated levels of tritium, trichloroethylene, tetrachloroethylene, chloroethene, antimony, 1,1-dichloroethylene, gross alpha, lead, nonvolatile beta, thallium, total alpha-emitting radium (radium-224 and radium-226), or cadmium.

24807 (WSRC-TR–92-518) **F- and H-Area Sewage Sludge Application Sites groundwater monitoring report, third quarter 1992.** Westinghouse Savannah River Co., Aiken, SC (United States). Jan 1993. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93012152. Source: OSTI; NTIS; GPO Dep.

During third quarter 1992, the four wells at the F-Area Sewage Sludge Application Site (FSS wells) and the three wells at the H-Area Sewage Sludge Application Site (HSS wells) were sampled and analyzed for constituents required quarterly by South Carolina Department of Health and Environmental Control Construction Permit 12,076. The F-Area Sewage Sludge Application Site wells also were analyzed for a number of other constituents not required by the permit. Mercury exceeded the Primary Drinking Water Standard (PDWS) in one analysis from well FSS 2D, and tritium exceeded the PDWS in wells FSS 2D and 3D. The mercury result above PDWS is considered suspect because it was not supported by a reanalysis from the same sample or by historical data. Iron exceeded the SRS Flag 2 criterion in wells FSS 3D, lead exceeded its criterion in wells FSS 3D and HSS 3D, and manganese exceeded its Flag 2 criterion in wells FSS 2D and 3D.

24808 (WSRC-TR–93-058) **F-Area Seepage Basins groundwater monitoring report: Fourth quarter 1992 and 1992 summary.** Westinghouse Savannah River Co., Aiken, SC (United States). Mar 1993. 394p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93013584. Source: OSTI; NTIS; INIS; GPO Dep.

During fourth quarter 1992, the groundwater at the F-Area Seepage Basins (FASB) was monitored in compliance with South Carolina Hazardous Waste Management Regulations, R61-79.265, Subpart F. Eighty-five wells provided samples from the three hydrostratigraphic units that make up the uppermost aquifer beneath the FASB. A detailed description of the uppermost aquifer is included in the Resource Conservation and Recovery Act Part B Post-Closure Care Permit Application for the F-Area Hazardous Waste Management Facility submitted to the South Carolina Department of Health and Environmental Control in December 1990. Historically, as well as currently, tritium, nitrate, gross alpha, total alpha-emitting radium, cadmium, and lead are the primary constituents observed above final Primary Drinking Water Standards (PDWS) in groundwater at the FASB. Nonvolatile beta has consistently exceeded its drinking water screening level. Other radionuclides and hazardous constituents also have exceeded the final PDWS in the groundwater at the FASB. The elevated constituents are found primarily in Aquifer Zone IIB_2 (Water Table) and Aquifer Zone IIB_1, (Barnwell/McBean) wells. However, several Aquifer Unit IIA (Congaree) wells also contain elevated levels of constituents, primarily tritium. Isoconcentration/isoactivity maps included in this report indicate both the concentration/activity and extent of the primary contaminants in each of the three hydrostratigraphic units for first and fourth quarters 1992. Water-level maps indicate that the groundwater flow rates and directions at the FASB have remained relatively constant since the basins ceased to be active in 1988.

24809 (WSRC-TR–93-066) **P-Area Acid/Caustic Basin groundwater monitoring report: Fourth quarter 1992 and 1992 summary.** Thompson, C.Y. Westinghouse Savannah River Co., Aiken, SC (United States). Mar 1993. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93013695. Source: OSTI; NTIS; GPO Dep.

During fourth quarter 1992, samples from the six PAC monitoring wells at the P-Area Acid/Caustic Basin were analyzed for indicator parameters, groundwater quality parameters, and parameters characterizing suitability as a drinking water supply. Monitoring results that exceeded the final Primary Drinking Water Standards (PDWS) or the Savannah River Site (SRS) flagging criteria or turbidity standard during the quarter are discussed in this report. During fourth quarter 1992, a sample from well PAC 6 exceeded the SRS turbidity standard. Iron and manganese each exceeded its Flag 2 criterion in wells PAC 2, 5, and 6. No analytes exceeded the final PDWS in wells at the P-Area Acid/Caustic Basin during 1992.

24810 (BNL–48858) **Preliminary results of the comparison of ATSR measurements with in situ sea temperatures.** Minnett, P.J. Brookhaven National Lab., Upton, NY (United States). 17 Mar 1993. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Grant NA26GP0266-01. (CONF-9303167–1: Along Track Scanning Radiometer (ATSR) science team meeting, Abingdon (United Kingdom), 30 Mar 1993). Order Number DE93013399. Source: OSTI; NTIS; GPO Dep.

During October and November, 1991, the NATO Research Vessel Alliance sailed from Amsterdam into the western Mediterranean Sea and during this time measurements were made for the validation of ATSR data. This document reports the initial comparison between ATSR measurements and sea-surface temperatures (SSTs) taken along the ship's track by an in situ thermometer at a depth of about 3m.

24811 (CFS/OO–46-13/35-1991E, pp. 266-302) **Chemical characteristics of precipitation, stream flow, lake water and sediments quality in northern temperate forest watersheds threatened by acidic atmospheric inputs.** Ouellet, M. (Quebec Univ., Ste-Foy, PQ (Canada)); Jones, H.G.; Auclair, J.C. Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Studies were carried out on the spatial and temporal distribution of certain chemical parameters of precipitation, lake water quality and paleolimnological profiles of the sediments in certain forested watersheds in the Laurentides Park, Quebec. The results establish the current response of watersheds to the present acidic atmospheric loading and indicate recent perturbations in the natural chemical flux within these systems. The effect of forest cover on the chemical characteristics of individual rain events in the spring and summer seasons is greater in magnitude than the variability between incoming precipitation episodes. Stream flow quality is little affected by changes in throughfall and seems to be more associated with total anion charge rather than pH level. The winter accumulation of acidic pollutants in the snow pack leads to an appreciable depression of pH levels during snowmelt with concomitant increases in aluminum concentrations and manganese/iron ratios of the stream waters. Long term changes in the water quality of the tributaries are reflected in the chemical profiles of such metals as Al and Mn in the most recent (0-100 y) lake sediments. The Pb, Zn and Hg concentration profiles of the upper 0-30 cm layer are good indicators of pollutant-load fluctuations in the recent past. A more complex type of profile is shown by ^{137}Cs, which is dependent on the nature of the watershed vegetation and shows different patterns of concentration in the surficial 0-10 cm of lake sediments. 88 refs., 15 figs., 4 tabs.

24812 (CFS/OO–46-13/35-1991E, pp. 429-437) **Time trends in selected chemical characteristics of streamflow from an undisturbed watershed in West Virginia.** Helvey, J.D. (United States Dept. of Agriculture, Parsons, WV (United States)); Kochenderfer, J.N. Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Stream chemistry records for a 38.9 ha watershed, undisturbed since 1910, were analyzed for time trends in pH between 1958 and 1982, and calcium, magnesium and sodium concentrations between 1970 and 1982. The pH analysis was inconclusive because of an instrument change in 1975, but changes, if they occurred, were very small. There was no change in levels of sodium, potassium or magnesium, but specific conductance and calcium concentrations have increased slightly in recent years. The cause for these changes is uncertain, but precipitation acidity could be influencing the chemical content of streamflow from this watershed. 10 refs., 4 figs.

24813 (CONF-9209335–1) **The significance of interactions of humic substances and organisms in the environment.** McCarthy, J.F.; Strong-Gunderson, J.; Palumbo, A.V. Oak Ridge National Lab., TN (United States). [1992]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International Humic Substances Society meeting; Bari (Italy); 20-25 Sep 1992. Order Number DE93011861. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division Publication No. 4046.

The diverse roles of humic substances in biological processes, and differences in the status of our understanding of these processes, is illustrated by examining two interactions. A significant body of literature elucidating the significance of natural organic matter (NOM) on the bioaccumulation of hydrophobic organic contaminants (HOC) by aquatic organisms is consistent with a general conclusion that HOC associated with NOM is not available for uptake by fish or aquatic invertebrates. In contrast to this relatively well-understood process, very little is known about the role of NOM in the ecology and nutrient dynamics of microbial communities in very deep subsurface environments.

24814 (CONF-921275–, pp. 71-74) **Removal of nitrate using catalyst loaded metal powder.** Sasaki, H. (Yokohama National University, Yokohama (Japan). Faculty of Engineering); Okazaki, S.; Kuraya, E.; Asakura, S. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

On the occasion that contamination of natural water with nitrate becomes a more serious problem, this paper discusses a method to remove nitrate ions using catalyst loaded metal powder which is inexpensive and whose eluates are harmless. First, iron powder of 100 mesh was activated by immersing it in 1N hydrochloric acid, and then immersed in copper nitrate aqueous solution to have the copper loaded. The experiment used 10^{-3} M sodium nitrate aqueous solution of pH 6.8 added with the copper loaded iron powder (hereinafter Cu-Fe) to investigate time-based change in concentrations of nitrate ions, nitrite ions, and ammonium ions. The nitrate ion concentration decreased apparently with time in a relationship of a primary expression. Various findings were obtained including the relationship between velocity constants and amounts of the loaded copper. Next, an experiment was carried out with the Cu-Fe filled in a column and the solution flowing, in which the pH change in the solution in the column reduced rapidly the nitrate ion removal rate. The experiment concluded that an installation of some kind of a pH adjusting mechanism would enable to maintain high removal rate. 6 figs.

24815 (DOE/ER/61438–T1) **Origins and fates of DOM along the New England continental margin: Techical progress report, Year 1.** Fry, B. (Marine Biological Lab., Woods Hole, MA (United States). Ecosystems Center); Hopkinson, C.; Altabet, M. Marine Biological Lab., Woods Hole, MA (United States). Ecosystems Center. [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER61438. Order Number DE93014282. Source: OSTI; NTIS; GPO Dep.

We have focused on methods development and completed an initial survey of Dissolved Organic Matter (DOM) concentration and isotopic composition during the 1994 spring bloom on Georges Bank. The methods development phase assures that high quality measurements will be made in years 2 and 3, and emphasizes developing two independent methods for DON determination. The survey work on Georges Bank will be extended in years 2 and 3 to

determine seasonal and spatial changes in DOM concentrations and isotopic compositions along the eastern US continental margin, from Georges Bank to Cape Hatteras.

24816 (DOE-RAS–92.004) **Environmental behaviour of radioactivity from Chernobyl: Brothers Water study.** Bonnett, P.J.P. (AEA Environment and Energy North, Billingham (United Kingdom)); Appleby, P.G.; Oldfield, F.; Haworth, E.Y.; Hilton, J.; Davison, W. Department of the Environment, London (United Kingdom). Radioactive Substances Div. 1992. [82p.] Contract PECD-7/9/359;HP 4.55.13. Order Number DE93625634. Source: OSTI; NTIS (US Sales Only); INIS.

A study has been carried out to examine the short term behaviour of Chernobyl derived radionuclides together with the longer term patterns of transport of weapons fallout derived ^{137}Cs first studied on the Brothers Water catchment in the English Lake District in the 1970's. Chernobyl derived radiocaesium is observable in the soils and lake sediments of the catchment. ^{210}Pb dating and diatom analysis were used to confirm that the lake sediments sampled were undisturbed. A simple box model is used to estimate radionuclide inventories in Brothers Water Lake sediments. Estimates derived using this model are reasonably consistent with estimates obtained from a variety of other sources. (author).

24817 (DOE-RAS–92.005) **Transport processes of Cs-137 in lake environments.** Hilton, J. (Inst. of Freshwater Ecology, Windermere (United Kingdom)); Carrick, T.R.; Lishman, J.P.; Rigg, E.; Davison, W.; Kelly, M.; Hamilton-Taylor, J. Department of the Environment, London (United Kingdom). Radioactive Substances Div. 1992. [89p.] Contract PECD-7/9/385. Order Number DE93625635. Source: OSTI; NTIS (US Sales Only); INIS.

Radiocesium levels in the waters of the Lake District dropped after the initial deposition following the Chernobyl reactor accident. However they continued to be measurable several years after the event. Caesium 137 concentrations were measured in the sediments of Esthwaite water and Windermere to determine the input of caesium 137 from the catchment area to the lakes. Experiments were conducted to ascertain the chemical conditions such as pH value, adsorption, competing ions which might contribute to maintaining caesium levels in the lakes. (U.K.).

24818 (DOE-RAS–92.008) **Radiological assessment of private water supplies in the Borough of Beverley, East Yorkshire, England.** ICI Tracerco, Billingham (United Kingdom). 1992. [43p.] Sponsored by Department of the Environment, London (United Kingdom). Radioactive Substances Div. Contract PECD-7/9/539;DG-LF-379. Order Number DE93624537. Source: OSTI; NTIS (US Sales Only); INIS.

Water samples from 100 private water supplies in the Borough of Beverley have been analysed for natural and artificial radionuclides and the elements Calcium and Strontium. In addition, 20 of the 100 supplies were specifically sampled for the measurement of Radon-222. Of the 100 supplies tested, all total alpha and beta analyses were within the WHO guideline values. An assessment of the radiological significance of the analytical data has been carried out by calculating the committed effective dose equivalent to a hypothetical "critical" group, which would arise from the consumption of water during a single year. The maximum adult annual committed effective dose equivalent for artificial and total radionuclides measured during this programme of monitoring was found to be 1.50 and 20.9 μSv, respectively. (author).

24819 (DOE-RAS–92.015) **Radioactive fallout in air and rain: results to the end of 1990.** Playford, K. (AEA Environment and Energy, Harwell (United Kingdom)); Lewis, G.N.J.; Carpenter, R.C. AEA Environment and Energy, Harwell (United Kingdom). 1992. [27p.] Sponsored by Department of the Environment, London (United Kingdom). Radioactive Substances Div. Contract PECD-7/9/537. (AEA-EE–0362.). Order Number DE93624538. Source: OSTI; NTIS (US Sales Only); INIS.

Samples of atmospheric particulate and rainwater have been collected from the United Kingdom and elsewhere. Results are presented of analyses of these samples for various fission products and certain other radionuclides. Average concentrations of Cs-137 in air in the United Kingdom in 1990 were 1% of those in 1986. They were attributable mainly to the resuspension of deposited activity resulting from the Chernobyl accident of April 1986. Plutonium concentrations in air and rainwater were a very small fraction of the National Radiological Protection Board's Generalised Derived Limit for members of the public. Estimates are given of the worldwide deposit of Cs-137 and Sr-90 to the end of 1990. The gamma and beta-ray dose rates from fallout at Chilton are estimated from the observed deposition. (author).

24820 (DUN–6205) **Chemicals discharged to the Columbia River from DUN facilities, fiscal year 1969.** Reilly, L.F.; Wells, G.W. Douglas United Nuclear, Inc., Richland, WA (United States). 1969. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012158. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report summarizes the chemical disposal data from facilities operated by Douglas United Nuclear, Inc., during fiscal year 1969. The total quantity of chemicals discharged to the Columbia River from the Single-Pass Reactor facilities is detailed in Section I and from the N Reactor facilities in Section II. In addition to the gross quantities shown, supplementary information has been included to note the manner and normal rate of discharge. Section III summarizes the disposal frequencies and estimated quantities of chemicals discharged to the 300 Area process ponds from DUN facilities. These materials are discharged to the process sewer and flow to the 300 Area process ponds. A portion of the chemicals reach the Columbia River through underground seepage. As the process sewer system in the 300 Area serves other companies as well, the controls established by DUN include routine composite sampling of the 300 Area process ponds. The automatic sampler collects integrated samples of pond inlet water that are analyzed weekly. This analytical data is included as Section IV.

24821 (DUN–7162) **Chemicals discharged to the Columbia River from DUN facilities, fiscal year 1970.** Wells, G.W.; Grubb, F.W. Douglas United Nuclear, Inc., Richland, WA (United States). 1970. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012159. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report summarizes the chemical disposal data from facilities operated by Douglas United Nuclear, Inc., during Fiscal Year 1970. The total quantity of chemicals discharged to the Columbia River from the Single-Pass Reactor facilities is detailed in Section I and from the N Reactor facilities in Section II. In addition to the gross quantities shown, supplemental information has been included to note the manner and normal rate of discharge. Section III summarizes the disposal frequencies and estimated quantities of chemicals discharged to the 300 Area process ponds from DUN facilities. These materials are discharged to the process sewer and flow to the 300 Area process ponds. A portion of the chemicals reach the Columbia River through underground seepage. Section III also includes a report of the former Plutonium Recycle Test Reactor water plant. Douglas United Nuclear, Inc., placed this facility in operation in FY 1970 to supply a portion of the area water needs formerly supplied by the City of Richland. As the process sewer system in the 300 Area serves other companies as well, the controls established by DUN include routine composite sampling of the 300 Area process ponds. The automatic sampler collects integrated samples of pond inlet water that are analyzed weekly. This analytical data is included in Section IV.

24822 (ETDE-mf–93792708) **Denitrification of special waste waters using external carbon sources.** Veroeffentlichungen des Instituts fuer Siedlungswasserwirtschaft, Technische Universitaet Braunschweig. Wolffson, C. Technische Univ. Braunschweig (Germany). Inst. fuer Siedlungswasserwirtschaft. 1992. 242p. (In German). Order Number DE93792708. Source: OSTI; NTIS (US Sales Only).

Experiments on a semi-technical scale revealed that the organic substrate in coking plant waste water, which results for a large part from phenol, cannot be used for denitrification of nitrified blast furnace gas scrubbing water and coking plant waste water. Instead, external addition of carbon was required to achieve low nitrate concentrations in the effluent. Adverse effects of cyanide, thiocyanate and nitrite were not observed as long as these were present in low concentrations. On the whole, it can be said that nitrogen can be

largely removed even from tricky waste waters as long as increased automatic control effort and supply with a suitable organic substrate are made allowance for. This presupposes a process technology matching the quality of waste water in each specific case and the cleaning target set. (orig./EF).

24823 (GKSS–92/E/48) **Absorption and transformation of mercury(II) and methylmercury chloride by suspended bacteria and microbial biofilms - investigations on the species behaviour of mercury in aqueous systems.** Ebinghaus, R. (GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany). Inst. fuer Chemie). GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany); Hamburg Univ. (Germany). Fachbereich 13 - Chemie. 1992. 159p. (In German). Order Number DE93792032. Source: OSTI; NTIS (US Sales Only).

Knowledge concerning transformation reactions of pollutants attached to suspended material in the river Elbe is very limited. In the present work the influence of bacteria and microbial biofilms on dynamic species transformations of mercury was investigated. Bacteria and microbial biofilms are capable of accumulating different mercury species in comparable concentrations. The formation of highly toxic monomethylmercury is more effective in the presence of organotin, -lead and -arsenic compounds via a transmethylation reaction than in the presence of biogenic methyldonators. Under oxic conditions bacteria isolated from suspended particulate matter decompose methylmercury to inorganic Hg(II) which is immobilized in the cells. (orig.) With 40 figs., 22 tabs.

24824 (GKSS–92/E/49) **4th Magdeburg seminar on prevention of water pollution - the situation of the river Elbe.** Wilken, R. D. (GKSS-Forschungszentrum Geesthacht GmbH, Inst. fuer Gewaesserforschung, Magdeburg (Germany)); Beyer, M.; Guhr, H. GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany). 1992. 376p. (In German). (CONF-9209352–: 4. Magdeburg seminar on prevention of water pollution - the situation of the river Elbe, Spindleruv Mlyn (Czechoslovakia), 22-26 Sep 1992). Order Number DE93792031. Source: OSTI; NTIS (US Sales Only).

From September 22nd-26th, 1992, the '4. Magdeburger Gewaesserschutzseminar - die Situation der Elbe -' (4th Magdeburg Seminar on prevention of water pollution - the situation of the river Elbe) took place in Spindleruv Mlyn, Czechoslovakia. These proceedings contain 75 contributions on the latest developments in Elbe research and Elbe pollution under the sections: Pollution of the Elbe: sources, situation, trends, transport; Ecology of the polluted Elbe; River construction; Measuring strategies for monitoring the Elbe; Modelling; Quality objectives and strategies. (orig.). With 103 figs., 92 tabs.

24825 (GKSS–92/E/50) **Analytical investigations for the determination of the chemical bonds (speciation) of tin in the sediments of the river Elbe by means of GC-AAS, GC-MS, TRFA and GFAAS.** Jantzen, E. (GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany). Inst. fuer Physik). GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht-Tesperhude (Germany); Hamburg Univ. (Germany). Fachbereich 13 - Chemie. 1992. 231p. (In German). Order Number DE93792030. Source: OSTI; NTIS (US Sales Only).

Until now the behaviour of tin and organotin species in sediments of the river Elbe has been poorly investigated. Hence analytical procedures for their determination, prototypic for mercury, lead and selenium as well, were developed and verified. The application of this speciation technique to investigations of transformation and transport processes is discussed. A newly developed GC-Quarzfurnace-ASS-System was used as analytical and GC-MS as reference principle. 'Insitu'-reactions with sodiumtetraethylborate (NaBEt4) made the various tin species and their patterns accessible. Natural and anthropogenic tin species as well as mixed forms were identified. Mobile and immobile tin forms were also distinguishable. Total tin was determined by TXRF and Zeeman-AAS. Elbe sediments are polluted with toxic organotin species, but the high content of tetrabutyltin from industrial emission, previously observed, was conspicuous. (orig.) With 57 figs., 43 tabs.

24826 (K/EM–24/R2) **Biological Monitoring and Abatement Program for the Oak Ridge K-25 Site.** Kszos, L.A. (Oak Ridge National Lab., TN (United States)); Adams, S.M.; Ashwood, T.L.; Blaylock, B.G.; Greeley, M.S.; Loar, J.M.; Peterson, M.J.; Ryon, M.G.; Smith, J.G.; Southworth, G.R.; Hinzman, R.L.; Shoemaker, B.A. Oak Ridge K-25 Site, TN (United States). Environmental Management Div.; Oak Ridge National Lab., TN (United States). Apr 1993. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93013731. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division Publication No. 4009.

A proposed Biological Monitoring and Abatement Program (BMAP) for the Oak Ridge K-25 Site was prepared in December 1992 as required by the renewed National Pollutant Discharge Elimination System permit that was issued on October 1, 1992. The proposed BMAP is based on results of biological monitoring conducted from 1986 to 1992 and discussions held on November 12, 1992, between staff of Martin Marietta Energy Systems, Inc. (Oak Ridge National Laboratory and the K-25 Site), and the Tennessee Department of Environment and Conservation, Department of Energy Oversight Division. The proposed BMAP consists of four tasks that reflect different but complementary approaches to evaluating the effects of K-25 Site effluents on the ecological integrity of Mitchell Branch, Poplar Creek, and the Poplar Creek embayment of the Clinch River. These tasks include (1) ambient toxicity monitoring, (2) bioaccumulation monitoring, (3) assessment of fish health, and (4) instream monitoring of biological communities. This overall BMAP plan combines established protocols with current biological monitoring techniques to assess environmental compliance and quantify ecological recovery. The BMAP will also determine whether the effluent limits established for the K-25 Site protect the designated use of the receiving streams (Mitchell Branch, Poplar Creek, and Clinch River) for growth and propagation of fish and other aquatic life. Results obtained from this biological monitoring program will also be used to document the ecological effects (and effectiveness) of remedial actions.

24827 (LA-SUB–93-48) **Development of an operational tool for biomonitoring using constant pressure respirometry: [Final report].** Zachritz, W.H. II (New Mexico State Univ., Las Cruces, NM (United States)); Morrow, J. Los Alamos National Lab., NM (United States); New Mexico State Univ., Las Cruces, NM (United States). 29 Jun 1992. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93008674. Source: OSTI; NTIS; INIS; GPO Dep.

The United States Environmental Protection Agency (US EPA) policy statement (FR 49, 9016, 9 March 1984) for the development of water quality based permit limitations includes toxicity testing of effluents as an important part of a water quality approach to controlling toxics (Pickering, 1988). To assure that state waters are free of toxics, both chemical and biological methods were recommended for assessing effluent quality. The US EPA validated bioassay procedures for toxicity testing of wastewater discharges use three distinctive organisms groups: vertebrates, invertebrates, and algae (Weber, 1989). The specific species for these three groups are fathead minnow, Pimephales promelas; water tea, Ceriodaphnia, dubia; and the green algae, Selenastrum capricornum, respectively. Definitive testing estimates the concentration atwhich a certain percentage of organisms exhibit a certain response. The definitive test exposes several replicate groups of organisms to the target substrate for a predetermined time period effluent concentration. The overall goal of this study is to develop an acceptable protocol for operational biomonitoring based on constant pressure respirometry for LANL. The specific objectives include: Development an appropriate toxicity testing protocol based on constant pressure respirometry for whole effluent toxicity testing, and evaluate the protocol based on factors such as sensitivity, response time, cost of analysis, and simplicity of operation.

24828 (LA-UR–93-507) **A continuation method for computing non-linear 3-D free surface flows.** Petersson, N.A. Los Alamos National Lab., NM (United States). Jan 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9305140–1: 8. international workshop on water waves and floating bodies, Newfoundland (Canada), 23-26

May 1993). Order Number DE93008704. Source: OSTI; NTIS; GPO Dep.

The subject of this paper is a pseudo-arclength continuation method for computing non-linear three-dimensional steady potential flow around a submerged body moving in a infinitely deep liquid at constant speed and distance below the free surface.

24829 (MAFF-AEMR–32) **A review of radioactivity in the Irish Sea: A report prepared for the Marine Pollution Monitoring Management Group.** Kershaw, P.J.; Pentreath, R.J.; Woodhead, D.S.; Hunt, G.J. Ministry of Agriculture, Fisheries and Food, Lowestoft (United Kingdom). Directorate of Fisheries Research. 1992. [65p.] Order Number DE93625636. Source: OSTI; NTIS (US Sales Only); INIS.

This review aims to provide a summary of knowledge to date and a stimulus for further work. Sellafield discharges in relation to the Irish Sea, monitoring and modelling are discussed.

24830 (ORNL/CDIAC–54) **Adapting to sea-level rise in the US Southeast: The influence of built infrastructure and biophysical factors on the inundation of coastal areas.** Daniels, R.C. (Tennessee Univ., Knoxville, TN (United States). Energy, Environment and Resources Center); Gornitz, V.M.; Mehta, A.J.; Lee, Saychong; Cushman, R.M. Oak Ridge National Lab., TN (United States). Carbon Dioxide Information Analysis Center. Nov 1992. 268p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93007799. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division Publication No. 3915.

The earth' s global mean surface air temperature has increased by 0.5°C over the past 100 years. This warming trend has occurred concurrently with increases in the concentration and number of greenhouse gases in the atmosphere. These gases may cause this trend to accelerate in the future and result in a net increase in the earth's global mean surface air temperature of 1.5 to 4.5°C by the year 2100. An increase of this magnitude could cause sea surface temperatures to increase would cause sea levels to rise -from thermal expansion of the sea, and the addition of melt waters from alpine glaciers and continental ice sheets. To allow for the cost-effective analysis of the impacts that sea-level rise may have on the US Southeast, a method is needed that will allow sites that are potentially at risk to be identified for study. Previously, no objective method was available to identify such sites. This project addresses this problem by using a geographic data base with information on both physical and climatological factors to identify coastal areas of the US Southeast that are at risk to inundation or accelerated erosion due to sea-level rise. The following six areas were selected for further study from the many identified as being at high risk: Galveston, Texas; Caminada Pass, Louisiana; Bradenton Beach, Florida; Daytona Beach, Florida; McClellanville, South Carolina; and Nags Head, North Carolina. For each study area the amount of land, by land use type, in danger from inundation from three sea-level-rise scenarios was calculated. The calculated values were based on elevation alone.

24831 (ORNL/M–1760) **Environmental Surveillance data report for the fourth quarter of 1992.** Goldberg, P.Y.; Cooper, R.C.; Hamilton, L.V.; Hughes, J.F.; Horwedel, B.M.; Loffman, R.S.; Salmons, M.C.; Stevens, M.M.; Valentine, C.K. Oak Ridge National Lab., TN (United States). Feb 1993. 139p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93009792. Source: OSTI; NTIS; GPO Dep.

The Environmental Surveillance and Protection Section within the Office of Environmental Compliance and Documentation at the Oak Ridge National Laboratory (ORNL) is responsible for the development and implementation of an envirorunental program to (1) ensure compliance with all federal, state, and Department of Energy (DOE) reporting requirements to quantitatively demonstrate prevention, control, and abatement of environmental pollution; (2) monitor the adequacy of containment and effluent controls; and (3) assess impacts of releases from ORNL facilities on the environment. Environmental monitoring, as defined by the Regulatory Guide, consists of two major activities: effluent monitoring and environmental surveillance. Effluent monitoring is the collection and analysis of samples or measurements of liquid and gaseous effluents. Monthly or quarterly summaries are presented in this report for each medium sampled. All data are rounded to two significant digits. The summary tables generally give the number of samples collected during the period and the maximum, minimum, average, and standard error of the mean (SE) values of parameters for which determinations were made.

24832 (PNL-SA–21080) **Tritium concentrations in the Columbia River at Richland.** Dirkes, R.L. Pacific Northwest Lab., Richland, WA (United States). Jan 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930130–8: 26. Health Physics Society midyear topical meeting on environmental health physics, Coeur d'Alene, ID (United States), 24-28 Jan 1993). Order Number DE93007874. Source: OSTI; NTIS; INIS; GPO Dep.

The concentrations of tritium in the Columbia River, which are measurable using special analytical techniques, have been decreasing during recent years. Tritium levels are significantly greater at the Richland Pumphouse downstream of the Hanford Site than upstream at Priest Rapids Dam. Tritium is known to enter the river along the Hanford Site as direct effluent discharges, which have been virtually eliminated, and through the seepage of ground water contaminated as a result of past operations. The seepage of contaminated ground water has continued, expanding over time to encompass a larger portion of the Hanford shoreline nearer to the downstream Columbia River monitoring station. Cross-sectional sampling of the river was conducted to determine the distribution of tritium across the river and evaluate the relationship between average tritium concentrations in the river and those measured by the downstream river sampling system.

24833 (SAND–92-7286) **Sandia Ocean Modeling System programmer's guide and user's manual.** Dietrich, D. (Ecodynamics Research Associates, Inc., Albuquerque, NM (United States)). Sandia National Labs., Albuquerque, NM (United States); Ecodynamics Research Associates, Inc., Albuquerque, NM (United States). Jan 1993. 141p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93007427. Source: OSTI; NTIS; GPO Dep.

The Sandia Ocean Modeling System (SOMS) (Dietrich et al., 1987) is not just one model but a modeling methodology to be applied in different modes (coarse or high resolution, boundary layers, with or without realistic topography, in a forecast or phenomenological mode, etc.) according to application requirements, hence its description as a modeling system. SOMS is applicable to a large range of geophysical flows from small lakes to large ocean basins. This document includes a description of governing equations and numerical methods and full details of the coding. Appendix A provides a complete listing of SOMS, including its movie-making modules. Appendix B presents the variables that appear in common blocks; this information is essential for a programmer intending to change the problem dimensions. Appendix C presents the results of a physical parameter sensitivity study. Appendix D presents results of a real ocean calculation.

24834 (SREL–39) **Wetland vegetation establishment in L-Lake.** Kroeger, S.R. Savannah River Ecology Lab., Aiken, SC (United States). Jul 1990. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00819. Order Number DE93013822. Source: OSTI; NTIS; INIS; GPO Dep.

Wetland vegetation was transplanted from PAR Pond to L-Lake between January and August, 1987. Approximately 100,000 individual plants representing over 40 species were transplanted along the southern shoreline. Three zones of vegetation were created: (1) submersed/floating-leaved, (2) emergent, (3) upper emergent/shrub. During the summers of 1987, 1988, 1989, the Savannah River Ecology Laboratory sampled the vegetation in 54 permanent transects located in planted (N=32) and unplanted areas (N=22). The 1989 vegetation data from L-Lake were compared to 1985 data from PAR Pond.

24835 (UBA-FB–92-118) **Development of a simple bacteria test for routine measurements in waste water. Summary of the final reports of the part projects.** Popp, W.; Rheinheimer, G.; Schulz, K.J.; Kalnowski, G.; Krebs, F. Bayerische Landesanstalt fuer Wasserforschung (BayLWF), Muenchen (Germany); Institut fuer Meereskunde an der Univ. Kiel (Germany); Technische Univ.

Berlin (Germany). Fachgebiet Hygiene; Bundesanstalt fuer Gewaesserkunde, Koblenz (Germany); Umweltbundesamt, Berlin (Germany). 1991. 32p. (In German). Contract UFOPLAN 10205307. Order Number DE93795328. Source: OSTI; NTIS (US Sales Only).

The following investigations are described: (1) Isolation and cultivation of marine luminescent bacteria, especially strains with higher optimum temperatures, testing of their applicability in toxicity tests, and attempts to standardize the procedure. (2) Isolation of freshwater strains; distribution of luminescent bacteria in water with different salinities and their applicability in bacterial toxicity tests. (3) Investigations into activity-maintaining conservation of Photobacterium phosphoreum in the low-temperature range, and (4) standardisation of the luminous bacteria test. (orig./BBR) With 9 refs.

24836 (UCRL-JC–112215) **Chemical and biological factors affecting bioavailability of contaminants in seawater.** Knezovich, J.P. Lawrence Livermore National Lab., CA (United States). Sep 1992. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9208217–1: Pellston workshop on chemical bioavailability in aquatic systems, Pellston, MI (United States), 18-21 Aug 1992). Order Number DE93011877. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discusses the influence that salinity has on the bioavailability of the two largest classes of contaminants, trace metals and organic compounds will be discussed. Although data on contaminant toxicity will be used to draw inferences about chemical availability, this discussion will focus on the properties that contaminants are likely to exhibit in waters of varying salinities. In addition, information on physiological changes that are affected by salinity will be used to illustrate how biological effects can alter the apparent availability of contaminants.

24837 (WSRC-MS–92-473) **Application of a simple parameter estimation method to predict effluent transport in the Savannah River.** Hensel, S.J.; Hayes, D.W. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-930667–1: International conference on inverse problems in engineering: theory and practice, Palm Coast, FL (United States), 13-18 Jun 1993). Order Number DE93011773. Source: OSTI; NTIS; INIS; GPO Dep.

A simple parameter estimation method has been developed to determine the dispersion and velocity parameters associated with stream/river transport. The unsteady one dimensional Burgers' equation was chosen as the model equation, and the method has been applied to recent Savannah River dye tracer studies. The computed Savannah River transport coefficients compare favorably with documented values, and the time/concentration curves calculated from these coefficients compare well with the actual tracer data. The coefficients were used as a predictive capability and applied to Savannah River tritium concentration data obtained during the December 1991 accidental tritium discharge from the Savannah River Site. The peak tritium concentration at the intersection of Highway 301 and the Savannah River was underpredicted by only 5% using the coefficients computed from the dye data.

24838 (WSRC-MS–92-479) **Metal finishing wastewater pressure filter optimization.** Norford, S.W.; Diener, G.A.; Martin, H.L. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9305166–1: American Filtration Society seminar and expo annual meeting, Chicago, IL (United States), 3-6 May 1993). Order Number DE93012139. Source: OSTI; NTIS; GPO Dep.

The 300-M Area Liquid Effluent Treatment Facility (LETF) of the Savannah River Site (SRS) is an end-of-pipe industrial wastewater treatment facility, that uses precipitation and filtration which is the EPA Best Available Technology economically achievable for a Metal Finishing and Aluminum Form Industries. The LETF consists of three close-coupled treatment facilities: the Dilute Effluent Treatment Facility (DETF), which uses wastewater equalization, physical/chemical precipitation, flocculation, and filtration; the Chemical Treatment Facility (CTF), which slurries the filter cake generated from the DETF and pumps it to interim-StatuS RCRA storage tanks; and the Interim Treatment/Storage Facility (IT/SF) which stores the waste from the CTF until the waste is stabilized/solidified for permanent disposal, 85% of the stored waste is from past nickel plating and aluminum canning of depleted uranium targets for the SRS nuclear reactors. Waste minimization and filtration efficiency are key to cost effective treatment of the supernate, because the waste filter cake generated is returned to the IT/SF. The DETF has been successfully optimized to achieve maximum efficiency and to minimize waste generation.

24839 (EGG–101617-2164) **San Joaquin kit fox (Vulpes velox macrotis) program, Camp Roberts, California: Progress report, fiscal years 1991–1992.** EG and G Energy Measurements, Inc., Goleta, CA (United States). Santa Barbara Operations. Oct 1992. 47p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC08-88NV10617. Order Number DE93013403. Source: OSTI; NTIS; GPO Dep.

Military training activities, new construction projects, and routine repair and maintenance activities conducted at Camp Roberts could adversely affect the endangered San Joaquin kit fox population. The Endangered Species Act of 1973 (as amended) states that all Federal agencies are to ensure that any actions authorized, funded, or carried out by the agency are not likely to have any detrimental effects on endangered species or their habitat. The major objective of the Camp Roberts Environmental Studies Program was to prepare a comprehensive Biological Assessment of the effects of all NGB-authorized activities on San Joaquin kit fox (military training, anticipated construction projects, repair and maintenance activities, and all NGB-authorized non-military activities such as a hunting and fishing program, grazing leases, etc.). The program also provided NGB with the scientific expertise necessary to ensure compliance with the Endangered Species Act. The objective of this report is to summarize the progress and results of the Environmental Studies Program during Fiscal Years 1991 and 1992 (FY91/92).

Glu-tRNA^{Glu} is synthesized from glutamate and tRNA^{Glu} by glutamyl-tRNA synthetase (GluRS). Recent work has demonstrated that Glu-tRNA^{Glu} has dual functions and is a precursor for protein and 5-aminolevulinate (ALA) synthesis. Current data does not provide compelling evidence for the notion that GluRS is regulated by chlorophyll precursors or in concert with the other enzymes of ALA synthesis. We have redefined the C5-pathway as a two-step route to ALA starting with Glu-tRNA^{Glu}. Only two enzymes, Glu-tRNA reductase (GluTR) and GSA-2,1-amino-mutase (GSA-AM), are specifically involved in ALA synthesis. We have purified these enzymatic activities from Chlamydomonas and demonstrated that the two purified proteins in the presence of their cofactors NADPH and pyridoxal phosphate are sufficient for the in vitro Glu-tRNA → ALA conversion. We have cloned the genes encoding GluTR. The sequences of the GluTR proteins deduced from these genes share highly conserved regions with those of bacterial origin. We havealso cloned and analyzed the gene encoding GSA-AM from Arabidopsis. As in Salmonella typhimurium, there are indications of the existence of an additional pathway for ALA formation in E. coli. To shed light on the recognition of the single tRNA^{Glu} by the chloroplast enzymes GluTR, GluRS we characterized a chlorophyll-deficient mutant of Euglena having tRNA^{Glu} with a point mutation

in the TΨC-loop. The altered tRNA supports protein but not ALA synthesis.

24841 (DOE/ER/13810–6) **The center for plant and microbial complex carbohydrates at the University of Georgia Complex Carbohydrate Research Center: Five-year report, September 15, 1987–December 31, 1992.** Albersheim, P.; Darvill, A. Georgia Univ., Athens, GA (United States). Complex Carbohydrate Research Center. May 1992. 164p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-87ER13810. Order Number DE93015589. Source: OSTI; NTIS; GPO Dep.

The Complex Carbohydrate Research Center (CCRC) is the home of ten independent but complementary interdisciplinary research groups led by nine regular faculty and one adjunct faculty. The research of these groups represents a broad spectrum of interests, and they are involved in about 90 collaborations with their CCRC and UGA colleagues and with scientists at other institutions and companies in the US, Canada, Europe, Israel, and Japan. The hallmark of the CCRC is the collaborative, interactive environment encouraged by its directors, faculty and tong-term staff. Newcomers to the CCRC or short-term members soon learn that everyone benefits from this process. The team-oriented approach in carbohydrate science translates into the day-today generous giving of one's time and expertise to the work of others, whether it be in sharing specialized instrumentation, participating in the design of experiments and interpretalon of data, providing service to scientists outside the CCRC, or joining collaborative projects. The CCRC is founded on the principle that the cross-fertilization of ideas and know-how leads to the synergisfic advancement of science. This report contains a series of appendices that document the extent and breadth of the Plant and Microbial Carbohydrate Center's contributions to collaborative research, training, and sen m. Several collaborative research projects that have received postdoctoral research associate support from the Grant are highlighted below, as these projects are particularly illustrative of the wide-ranging collaborations that have evolved as a result of this Grant and the quality of the science that the Grant enables. Each of the projects receives support from other grants. In each of the four sections below, we include the scientific background of the projects, our accomplishments to date, and our current and proposed activities.

24842 (DOE/ER/13909–3) **[Characterization of a putative S locus encoded receptor protein kinase and its role in self-incompatibility]: Progress report, January 1993.** Cornell Univ., Ithaca, NY (United States). 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER13909. Order Number DE93013987. Source: OSTI; NTIS; GPO Dep.

The serine/threonine protein kinase (SRK) protein was predicted to be similar to the growth factor receptor tyrosine kinases in animals but its amino acid sequence of the catalytic domain is more similar to that of the catalytic domains of protein serine/threonine kinases than to protein tyrosine kinases. We have shown that the SRK protein has intrinsic scrine/threonine kinase activity. We subcloned the protein kinase-homologous domain of the SRK_6 cDNA into the bacterial expression vector pGEX-3X and we have constructed a second plasmid identical to the first except that it carried a conservative mutation that substituted Arg for the Lys^{524} codon of SRK6 This lysine corresponds to the ATP-binding site, is essential in protein kinases, and is a common target for site-directed mutagenesis as a means to obtain kinase-defective proteins. Cultures bearing the wild-type and mutant SRK catalytic domains each produced an approximately 64 kD protein that reacted with anti-SRK6 antibodies. Following pulse-labeling with ^{32}P we found that the wild-type SRK6 protein but not the mutant form was detectably phosphorylated. Phosphoamino acid analysis of the affinity purified ^{32}p-labeled GST-SRK6 fusion protein demonstrated that SRK was phosphorylated predominantly on semine and to a lesser extent on threonine, but not on tyrosine. Thus, SRK6 is a functional serine/threonine protein kinase.

24843 (DOE/ER/13970–4) **CarbBank: A structural and bibliographic database for complex carbohydrates: Progress report, September 15, 1991–September 14, 1992.** Albersheim, P. Georgia Univ., Athens, GA (United States). Complex Carbohydrate Research Center. Jun 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-88ER13970. Order Number DE93015582. Source: OSTI; NTIS; GPO Dep.

The CarbBank project has several key facets: building a computer database that presents carbohydrate sequence information derived from the published literature, programming to create computer applications that use the information in the database, creating software for multiple computer platforms, and distributing software to end users.

24844 (DOE/ER/14056–14) **Direct probing of chromatography columns by laser-induced fluorescence: Technical progress report, September 1, 1989–February 28, 1993.** McGuffin, V.L. Michigan State Univ., East Lansing, MI (United States). Dept. of Chemistry. 7 Dec 1992. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER14056. Order Number DE93015208. Source: OSTI; NTIS; GPO Dep.

This report summarizes the progress and accomplishments of this research project from September 1, 1989 to February 28, 1993. During this period, we have accomplished all of the primary scientific objectives of the research proposal: (1) constructed and evaluated a laser-induced fluorescence detection system that allows direct examination of the chromatographic column, (2) examined nonequilibrium processes that occur upon solute injection and elution, (3) examined solute retention in liquid chromatography as a function of temperature and pressure, (4) examined solute zone dispersion in liquid chromatography as a function of temperature and pressure, and (5) developed appropriate theoretical models to describe these phenomena. In each of these studies, substantial knowledge has been gained of the fundamental processes that are responsible for chromatographic separations. In addition to these primary research objectives, we have made significant progress in three related areas: (1) examined pyrene as a fluorescent polarity probe insupercritical fluids and liquids as a function of temperature and pressure, (2) developed methods for the class-selective identification of polynuclear aromatic hydrocarbons in coal-derived fluids by microcolumn liquid chromatography with fluorescence quenching detection, and (3) developed methods for the determination of saturated and unsaturated (including omega-3) fatty acids in fish oil extracts by microcolumn liquid chromatography with laser-induced fluorescence detection. In these studies, the advanced separation and detection techniques developed in our laboratory are applied to practical problems of environmental and biomedical significance.

24845 (DOE/ER/20050–2) **Calmodulin immunolocalization to cortical microtubules is calcium independent.** Fisher, D.D.; Cyr, R.J. Pennsylvania State Univ., University Park, PA (United States). Dept. of Biology. [1992]. 36p. Sponsored by USDOE, Washington, DC (United States); Department of Agriculture, Washington, DC (United States). DOE Contract FG02-91ER20050. Order Number DE93015098. Source: OSTI; NTIS; GPO Dep.

Calcium affects the stability of cortical microtubules (MTs) in lysed protoplasts. This calmodulin (CaM)-mediated interaction may provide a mechanism that serves to integrate cellular behavior with MT function. To test the hypothesis that CaM associates with these MTs, monoclonal antibodies were produced against CaM, and one (designated mAb1D10), was selected for its suitability as an immunocytochemical reagent. It is shown that CaM associates with the cortical Mats of cultured carrot (Daucus carota L.) and tobacco (Nicotiana tobacum L.) cells. Inasmuch as CaM interacts with calcium and affects the behavior of these Mats, we hypothesized that calcium would alter this association. To test this, protoplasts containing taxol-stabilized Mats were lysed in the presence of various concentrations of calcium and examined for the association of Cam with cortical Mats. At 1 μM calcium, many protoplasts did not have CaM in association with the cortical Mats, while at 3.6 μM calcium, this association was completely abolished. The results are discussed in terms of a model in which CaM associates with Mats via two types of interactions; one calcium dependent and one independent.

24846 (DOE/ER/20050–T1) **Role of Ca^{++}/calmodulin in the regulation of microtubules in higher plants: Progress report, FY 1992.** Cyr, R. Pennsylvania State Univ., University Park, PA (United States). Dept. of Biology. [1992]. 7p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract FG02-91ER20050. Order Number DE93015885. Source: OSTI; NTIS; GPO Dep.

The cytoskeleton including its microtubule (Mt) component participates in processes that directly affect growth and development in higher plants. Normal cytoskeletal function requires the precise and orderly arrangement of Mts into several cell cycle and developmentally specific arrays. The cortical array somehow directs the deposition of cellulose. Little molecular information is available regarding the formation of these arrays or the cellular signals to which they respond. Experimental data described here suggests that plant cells use calcium, in the form of a Ca^{++}/calmodulin complex, to affect the dynamics of Mts within the cortical array. Owing to the importance of Ca^{++} as a regulatory ion in higher plants we are probing for a putative Ca^{++}/Mt transduction pathway which may serve to integrate Mt activities within the growing and developing plant cell. We are using a lysed cell model in conjunction with immunocytochemical and biochemical methodologies to dissect how Ca^{++}/calmodulin interacts with Mts to affect their function.

24847 (DOE/FTR–4349) **[Travel to Turin, Italy, to attend and participate in an international workshop entitled "Biological sequences: Finding structure and function by neural networks"]: Foreign trip report, June 29, 1992–July 15, 1992.** Mural, R.J. Oak Ridge National Lab., TN (United States). 30 Jul 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012772. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The problem of identifying biologically meaningful patterns in the sequences of biological macromolecules, such as DNA and proteins, has taken on increased significance because of the very large amount of primary sequence data which has been generated over the last several years. The techniques of neural network computing provide a powerful tool for pattern recognition in general and have shown promising results when applied to biological sequences. The workshop "Biological Sequences: Finding Structure and Function by Neural Networks" brought together 23 investigators whose work focuses on finding patterns in biological sequences. The traveler presented a paper entitled "Combing neural networks and expert systems to identify features in DNA sequences" at this workshop.

24848 (ETDE/ES-mf–93796608) **The Keratin 6 gene family: Charaterization and regulation.** Navarro Espinel, J.M. (Universidad Complutense de Madrid. Dept. Biologia (Spain)). Universidad Complutense de Madrid (Spain). Dept. de Fisica Atomica, Molecular y Nuclear. 1992. 117p. (In Spanish). Order Number DE93796608. Source: OSTI; NTIS.

Cytokeratins are a family of ca. 30 proteins that are expressed exclusively in epithelial cells, where they constitute the intermediate filaments cytoskeleton. Keratin 6 is expressed in some tissues (tongue, esophagus, foot sole epidermis, etc.), as well as in the suprabasal layers of epidermis under hyperproliferative stimuli, such as tpa, wound healing, etc. In addition, it is expressed in most cultured epidermal cells lines. We have found that there are three different genes coding for similar-but not identical-k6 polypeptides in the cow. We have used CAT assays, gel retardation and footprinting techniques to analyze the promoter of one of the genes in several cell lines and have found two elements implicated in the regulation of this gene. One of them is a AP1-like site and the other seems to be a retinoic-acid responsive element. Implications of these findings for the regulation of the K6 gene are discussed. (author).250 refs, 48 figs.

24849 (ETDE/ES-mf–93796609) **Antisense RNA: a genetic approach to cell resistance against Parvovirus.** Ramirez Martinez, J.C. Universidad Autonoma de Madrid (Spain). Facultad de Ciencias Fisicas. 1992. 100p. (In Spanish). Order Number DE93796609. Source: OSTI; NTIS.

The Minute Virus of Mice (MVMp), an autonomous Parvovirus that replicates cytolytically in the A9 mouse fibroblast cell line, was interfered by constitutive expression of an antisense RNA targeted against the major non-structural NS-1 protein. Permanently transfected A9 clones expressing NS-1 antisense, showed increased proliferative capacity upon virus infection, and likewise cultures infected at low multiplicity by MVMp reached confluence overcoming virus growth. Correspondingly, an inhibition in virus multiplication was demonstrated by a significant lower virus production and plaque forming ability in clones expressing antisense RNa. At the molecular level, several fold reduction in viral DNA, RNA and proteins was quantitated by respective analysis of Southern, RNase protection and bidimensional gels. Remarkably, the accumulation of all three viral messengers(R1,R2,R3) was decreased both in the cytoplasm and in the nucleus, suggesting that antisense-mediated inhibition is primarily exerted at the level of viral transcription or nuclear post-transcriptional events. Thus, this system illustrates the possibility to create an antisense-mediated protective stage to highly cytotoxic viruses in permissive cells, by down-modulation the expression of a transactivator of virus genes. (author)180 refs., 25 figs.

24850 (DOE/ER/60692–5) **Mapping and ordered cloning of the human X chromosome: Progress report, September 1991–November 1992.** Caskey, C.T.; Nelson, D.L. Baylor Univ., Houston, TX (United States). Inst. of Molecular Genetics. Dec 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-88ER60692. Order Number DE93015072. Source: OSTI; NTIS; GPO Dep.

Progress is reported on gathering X chromosome specific libraries and integrating those with the library produced in this project. Further studies on understanding Fragile X Syndrome and other hereditary diseases related to the X chromosome are described. (DT)

24851 (DOE/ER/60851–4) **Field-flow fractionation of chromosomes: Final technical report, July 1, 1989–January 31, 1993.** Giddings, J.C. Utah Univ., Salt Lake City, UT (United States). Apr 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER60851. Order Number DE93015094. Source: OSTI; NTIS; GPO Dep.

The first topic of this project involved the preparation, fractionation by sedimentation/steric Field Flow Fractionation (FFF), and modeling of metaphase chromosomes. After numerous unsuccessful attempts to prepare chromosomes, we have implemented a procedure (in collaboration with Los Alamos National Laboratory) to prepare metaphase chromosomes from Chinese hamster cells. Extensive experimentation was necessary to identify a suitable FFF channel surface to minimize chromosome adsorption and a carrier liquid to stabilize and disperse the chromosomes. Under suitable operating conditions, the Chinese hamster chromosomes were purified from cell debris and partially fractionated. The purified, preenriched chromosomes that can be prepared by sedimentation/steric FFF or produced continuously by continuous SPLITT fractionation provide an enriched feed material for subsequent flow cytometry. In the second project component, flow FFF permitted successful separations of single- from double-stranded circular DNA, double-stranded circular DNAs of various sizes, and linear double-stranded DNA fragments of various lengths. Diffusion coefficients extracted from retention data agreed well with literature data as well as predictions of major polymer theories. The capacity of FFF separations was evaluated to examine potential applications to long DNA chains.

24852 (LA-UR–93-1647) **Genetic algorithms for DNA sequence assembly.** Parsons, R. (Los Alamos National Lab., NM (United States)); Burks, C.; Forrest, S. Los Alamos National Lab., NM (United States). 13 Apr 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930745–1: 1. international conference in intelligent systems for molecular biology, Washington, DC (United States), 7-9 Jul 1993). Order Number DE93012708. Source: OSTI; NTIS; GPO Dep.

This paper describes a genetic algorithm application to the DNA fragment assembly problems. The genetic algorithm uses a

random key representation for representing the orderings of fragments. Two different fitness functions, both based on pairwise overlap strengths between fragments, were tested. The paper concludes that the genetic algorithm is a promising method for fragment assembly problems, achieving usable solutions quickly, but that the current fitness functions are flawed and that other representations might be more appropriate.

24853 (UCRL-ID–111825) **Dose-to-risk conversion factors for low-level tritium exposures.** Straume, T. Lawrence Livermore National Lab., CA (United States). 10 Sep 1992. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93009444. Source: OSTI; NTIS; INIS; GPO Dep.

During the past decade, a large number of radiobiological studies have become available for tritium-many of them focusing on the relative biological effectiveness (RBE) of tritium beta rays. These and previous studies indicate that tritium in body water produces the same spectrum of radiogenic effects, e.g., cancer, genetic effects, developmental abnormalities, and reproductive effects, observed following whole-body exposure to penetrating radiations such as gamma rays and x rays. The only significant difference in biological response between tritium beta-rays and the other common low linear-energy transfer (LET) radiations, such as gamma rays and x rays, appears to be the greater biological effectiveness of tritium beta rays. For example, tritium in the oxide form (HTO) is about 2 to 3 times more effective at low doses or low dose rates than gamma rays from ^{137}Cs or ^{60}CO (Straume, 1991). When tritium is bound to organic molecules, RBE values may be somewhat larger than those for HTO. It is now clear from the wealth of tritium data available that RBEs for tritium beta rays are higher than the quality factor of unity generally used in radiation protection.

24854 (UCRL-JC–111419) **Livermore's pragmatic approach to integrated mapping for chromosome 19.** Slezak, T.; Wagner, M.; Yeh, M.; Cantu, R. III; Branscomb, E. Lawrence Livermore National Lab., CA (United States). 15 Jul 1992. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9207189–1: Computational methods in genome research conference, Heidelberg (Germany), 1-4 Jul 1992). Order Number DE93011875. Source: OSTI; NTIS; GPO Dep.

For several years Livermore has been using a bottom-up approach to physical mapping, constructing contigs from cosmid clone fingerprints. We currently have 7112 clones placed in 854 contigs and now are using various other means to close gaps, complete, and verify the map. This has required us to develop an information model capable of handling all the important relationships between any "mappable object" and producing a variety of ways of visualizing this integrated data. We have defined a set of relations on a single generic map object class that allows us to distill all the distance/order/orientation/overlap/etc. data contained in our underlying database, along with algorithms to construct partial order trees and display the integrated results in our X-windows database browser tool. This system uses Sybase/SQL/Unix/C and can be used on Sun color Sparcstations with Internet access. We currently have SQL access to the GDB and GenBank database servers but are not yet extracting relevant data from these sources into our integrated map except through our direct collaborative orations with data submitters.

24855 (BNL–48454) **CT imaging of small animals using monochromatized synchrotron x rays.** Dilmanian, F.A. (Brookhaven National Lab., Upton, NY (United States)); Rarback, H.; Nachaliel, E.; Rivers, M.; Thomlinson, W.C.; Chapman, L.D.; Oversluizen, T.; Slatkin, D.N.; Spanne, P.; Spector, S.; Garrett, R.F.; Luke, P.N.; Pehl, R.; Thompson, A.C.; ApBrookhaven National Lab., Upton, NY (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-921005–30: Institute of Electrical and Electronic Engineers (IEEE) nuclear science symposium and medical imaging conference, Orlando, FL (United States), 26-31 Oct 1992). Order Number DE93009329. Source: OSTI; NTIS; GPO Dep.

Rats and chicken embryos were imaged in vivo with a prototype Multiple Energy Computed Tomography (MECT) system using monochromatized x rays from the X17 superconducting wiggler at the National Synchrotron Light Source. The CT configuration coated of a horizontal low-divergence, fan-shaped beam, 70 mm wide and 0.5 mm high, and a subject rotating about a vertical aids. A linear-array high-purity Ge detector with 140 elements, each 0.5 mm wide and 6 mm thick, was used with a data acquisition system that provides a linear response over almost six orders of magnitude of detector current. The dual photon absorptiometry (DPA) algorithm was applied to images of the rat head acquired at 20 and 45 keV to obtain two new images, one representing the low-Z, and the other the intermediate-Z clement group. The results indicate that the contrast resolution and the quantification accuracy of the images improve stepwise; first, with the monochromatic beam and, second, the DPA method. The system is a prototype for a brain scanner.

24856 (DOE/ER/60487–7) **Development of more efficacious T_c-99m organ imaging agents for use in nuclear medicine by analytical characterization of radiopharmaceuticals: Annual technical progress report, September 1, 1992–August 31, 1993.** Heineman, W.R. Cincinnati Univ., OH (United States). Dept. of Chemistry. 3 May 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER60487. Order Number DE93014435. Source: OSTI; NTIS; INIS; GPO Dep.

This research program is detailed at development of more efficacious technetium-99m radiopharmaceuticals for use as imaging agents in diagnostic nuclear medicine. We seek to isolate and develop distinct site imaging agents to provide diagnostic information concerning a given pathological condition. Analytical techniques are being developed to enable complete analysis of radiopharmaceutical preparations so that individual complexes can be characterized with respect to imaging efficacy and to enable a radiopharmaceutical to be monitored after injection into a test animal to determine the species that actually accumulates in an organ to provide the image. Administration of the isolated, single most effective imaging complex, rather than a mixture of technetium-containing complexes, wi-11 minimize radiation exposure to the patient and maximize diagnostic information available to the clinician. This report specifically describes the development of capillary electrophoresis (CE) for characterizating diphosphonate skeletal imaging agents. Advances in the development of electrochemical and fiber optic sensors for Tc and Re imaging agents are described. These sensors will ultimately be capable of monitoring a specific chemical state of an imaging agent in vivo after injection into a test animal by implantation in the organ of interest.

24857 (DOE/ER/60561–8) **New techniques for positron emission tomography in the study of human neurological disorders: Progress report, June 1990–June 1993.** Kuhl, D.E. Michigan Univ., Ann Arbor, MI (United States). Div. of Nuclear Medicine. [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER60561. Order Number DE93014439. Source: OSTI; NTIS; GPO Dep.

This progress report describes accomplishments of four programs. The four programs are entitled (1) Faster,simpler processing of positron-computing precursors: New physicochemical approaches, (2) Novel solid phase reagents and methods to improve radiosynthesis and isotope production, (3) Quantitative evaluation of the extraction of information from PET images, and (4) Optimization of tracer kinetic methods for radioligand studies in PET.

24858 (DOE/ER/61033–3) **Scintillation materials for medical applications: Annual progress report, January 1, 1991–December 31, 1992.** Lempicki, A.; Wojtowicz, A.J. Boston Univ., MA (United States). [1992]. 6p. Sponsored by USDOE,

Washington, DC (United States). DOE Contract FG02-90ER61033. Order Number DE93015356. Source: OSTI; NTIS; GPO Dep.

Scintillators are beginning to attract renewed attention because modern High Energy Physics accelerators are placing unprecedented demands of quantity and quality of detector materials and Positron Emission Tomography (PET), used by the medical field. Both applications required materials for scintillator detectors with properties beyond those delivered by traditional scintillators. Thallium doped halides are very efficient, but slow and chemically unstable. Two modern developments, namely the very fast BaF_2, which owed its success to the newly discovered crossover transitions, and CeF_3, which carried a promise of fast components, more practical wavelengths and attractive efficiency. Since traditional scintillators (Tl doped halides) are very efficient, and could be even more efficient at larger concentrations of Tl, if it were not for concentration quenching. However Tl transitions are spin forbidden and slow. Both ills could be remedied by replacing Tl with Ce, whose transitions are allowed and which is known to form fully concentrated compounds of high photoluminescent efficiency and no quenching. These materials, plus new Ce-doped materials, exhibiting highly promising properties for medical applications, became the target of our studies.

24859 (DOE/FTR–93011413) **Travel to Russia to access the proton therapy and channeling facilities: Foreign trip report, October 2–13, 1992.** Carrigan, R. Fermi National Accelerator Lab., Batavia, IL (United States). 21 Nov 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE93011413. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This travel report addresses the economic plight of investigators with whom the traveler has previous and continuing relationship concerning proton therapy in the Russian Federation. (DT)

24860 (FNAL/C–93/077) **Neutron sources for a neutron capture therapy facility.** Lennox, A.J. Fermi National Accelerator Lab., Batavia, IL (United States). Apr 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-930168–5: Simulating accelerator radiation environments workshop, Santa Fe, NM (United States), 11-15 Jan 1993). Order Number DE93011887. Source: OSTI; NTIS; GPO Dep.

Recent advances in the development of boron pharmaceuticals have reopened the possibility of using epithermal neutrons to treat brain tumors containing boron-10. This paper summarizes the approaches being used to generate the neutron sources and identifies specific areas where more research and development are needed.

24861 (INDC(NDS)–203/GZ) **Nuclear data needed for neutron therapy: Summary report of the 1. research co-ordination meeting held in Vienna, 17-20 November 1987.** Okamoto, K. (ed.) (International Atomic Energy Agency, Vienna (Austria). Nuclear Data Section). International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Mar 1988. [18p.] (CONF-8711365–: 1. research co-ordination meeting on nuclear data needed for neutron therapy, Vienna (Austria), 17-20 Nov 1987). Order Number DE93626071. Source: OSTI; NTIS (US Sales Only); INIS.

This is the summary report of the First Research Co-ordination Meeting of the IAEA Co-ordinated Research Programme (CRP) on Nuclear Data Needed for Neutron Therapy, convened by the IAEA Nuclear Data Section in Vienna, from 17 to 20 November 1987. The main objectives of the CRP are to improve the present state of nuclear data for neutron therapy. (author).

24862 (INDC(NDS)–216/GZ) **Nuclear data needed for neutron therapy: Summary report of the 2. research co-ordination meeting held in Vienna, 24-27 January 1989.** Okamoto, K. (ed.) (International Atomic Energy Agency, Vienna (Austria). Nuclear Data Section). International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Mar 1989. [35p.] (CONF-8901230–: 2. research co-ordination meeting on nuclear data needed for neutron therapy, Vienna (Austria), 24-27 Jan 1989). Order Number DE93626072. Source: OSTI; NTIS (US Sales Only); INIS.

The Second Research Co-ordination Meeting (RCM) of the IAEA Co-ordinated Research Programme (CRP) on Nuclear Data Needed for Neutron Therapy was convened by the IAEA Nuclear Data Section, in Vienna, from 24 to 27 January 1989. The Summary Report of the First RCM was issued as INDC(NDS)-203/GZ (March 1988). Special emphasis was put on the discussion of the issue of the final publication of this CRP. (author). 36 refs, 8 tabs.

24863 (INDC(NDS)–216/GZ, pp. 7-24) **Present status of fast neutron therapy survey of the clinical data and of the clinical research programmes.** Wambersie, A. (Louvain Univ., Brussels (Belgium). Cliniques Universitaires St. Luc); Richard, F. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Mar 1989. (CONF-8901230–: 2. research co-ordination meeting on nuclear data needed for neutron therapy, Vienna (Austria), 24-27 Jan 1989). In *Nuclear data needed for neutron therapy: Summary report of the 2. research co-ordination meeting held in Vienna, 24-27 January 1989.* [35p.] Order Number DE93626072. Source: OSTI; NTIS (US Sales Only); INIS.

The clinical results reported from the neutron therapy centers in USA, Europe and Asia are reviewed. Fast neutrons are shown superior to photons for locally extended inoperable salivary gland tumors with overall local control rates are 67% verses 24%. Paranasal sinuses and some tumors of the head and neck area, especially extended tumors with large fixed lymph nodes, are also indications for neutrons. By contrast, the results obtained for brain tumors were, in general, disappointing. Neutrons were shown to bring a benefit in the treatment of well differentiated slowly growing soft tissue sarcomas. The reported overall local control rates were 53% and 38% after neutron and photon irradiation respectively. Better results, after neutron irradiation, were also reported for bone- and chondrosarcomas. The reported local control rates are 54% for osteosarcomas and 49% for chondrosarcomas after neutron irradiation; the corresponding values are 21% and 33% respectively after photon irradiation. For locally extended prostatic adenocarcinoma, the superiority of mixed schedule (neutrons + photons) was demonstrated by a RTOG randomized trial (local control rates 77% for mixed schedule compared to 31% for photons). Neutrons were also shown to be useful for palliative treatment of melanomas. Further studies are needed in order to definitively evaluate the benefit of fast neutrons for other areas such as uterine cervix, bladder, and rectum. It can be concluded that fast neutrons are superior to photons for at least 10% to 20% of the radiotherapy patients. While it is recognized that the first patient series were treated under suboptimal conditions, recent improvements have been made using high-energy hospital-based cyclotrons fully dedicated to neutron therapy. 36 refs, 8 tabs.

24864 (INDC(NDS)–217/GZ, pp. 15-40) **The future of high-let radiation in cancer therapy. Justification of the heavy-ion therapy programmes.** Wambersie, A. (Louvain Univ., Brussels (Belgium). Cliniques Universitaires St. Luc). International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Mar 1989. (CONF-8901231–: 1. research co-ordination meeting on atomic and molecular data for radiotherapy, Vienna (Austria), 30 Jan - 2 feb 1989). Source: OSTI; NTIS (US Sales Only); INIS.

The introduction of new types of ionizing radiations to control the primary tumour is a promising approach in radiation therapy. High-LET (linear energy transfer) radiations produce different biological effects compared to conventional X-rays, leading to a potential therapeutic advantage over low-LET (e.g., protons or helium ions) beams, which only are aimed at improving the physical selectivity. Introduced historically to reduce the OER (oxygen enhancement ratio), there is evidence for a reduction in radiosensitivity differences, which implies an advantage or disadvantage depending on the tumour characteristics and the normal tissues at risk, which in turn raises the problem of patient selection. From clinical data, fast neutrons were found to be superior to photons in the treatments of salivary gland tumours, prostatic adenocarcinomas, and some carcinomas. Heavy ions combine the advantages of a high physical selectivity and the potential advantage of high-LET for some tumour types. Clinical indications for the use of heavy-ion beams are therefore those tumours that reside in problematic sites but are of a type for which high-LET radiations were already shown to be

useful. This review discusses the improvement of the physical selectivity with proton and helium ion beams; the differential effect and the potential advantage of neutrons and high-LET radiations (including both the radiological considerations and the clinical data); and presents the rationale for heavy-ion therapy. 38 refs, 7 figs, 10 tabs.

Guided by the ICRU concept, first of all the requirements on the accuracy of dose determination resulting from clinical observations (dose-response relationship) are dealt with. On average a total uncertainty (1 standard deviation) of dose determination of 3.5% has to be sought. In four steps - dosimetry, simulation/localization, dose planning and irradiation - the respective dose uncertainties are estimated and illustrated by examples. The result obtained by square error addition, of a total uncertainty of 8% (1 standard deviation) is contrasted with multi-centric reference actions with phantom irradiations. It shows that the accuracy requirement of 5% on dosimetry in clinical routine is not easy to achieve. (orig.).

The philosophy of the course described here is to underscore the essence of microbiology which is diversity>: diversity of morphology and cellular development, behavior, and metabolic and physiological functions. Emphasis is on microbes other than those customarily covered in conventional microbiology courses and includes: the archaebacteria, extremophiles, and array of obligate anaerobes, various phototrophs, and those microbes exhibiting complex developmental cycles. Also included are microbes carrying out a variety of transformations of organic and inorganic compounds, as well as those which normally occur in symbiotic association with other microbes or with higher forms of life.

The traveler first visited England where the British Embassy in Washington arranged a visit to the remote sensing archives of the Royal Air Force at Huntingdon, England. Staff at the Joint Air Reconnaissance Intelligence Centre valuable information regarding the availability of imagery dating back to the 1920s. The most important discovery was a nearly complete aerial survey of Africa made soon after World War II. Informal agreements were made to pursue joint research on using these data for global. Following the visit to England, the Agriculture Counsular at the German Embassy in Washington, assisted in making arrangements to visit selected government officials to discuss the possibility of using the Tellow Estate of Johann Heinrich von Thunen as a demonstration site for sustainable agriculture. Thunen (1783–1850) was a famous agricultural economist known internationally for his theory explaining agricultural production and location. The Estate was presumed destroyed but was rediscovered after reunification. The possibility of using the estate as a demonstration site to aid in rebuilding East European countries was discussed with officials at the University of Rostock, local governments, and with the Ministry of Agriculture. All agreed that pending funds and interest within the scientific community, every effort should be made to preserve the Estate as a demonstration farm and eventually convert the facility into a research institute.

The theories put forward here are predominantly based on pooled data from previous studies in a number of cohorts made up by mostly non-average individuals. These studies were carried out by various researchers and differed in procedures and aims. Factors of major importance to the validity and reliability of the conclusions drawn from this study are pointed out. In one chapter some light is thrown on factors known to bear a relation to the incidence of radiation-induced cancer of the breast, even though at present this can only very vaguely be described on a quantitative basis. These factors include fractionated dose regimens, pregnancies and parturitions, menarche, menopause, synergisms as well as secondary cancer of the breast. The available body of evidence suggests that exposure of each of 1 million women to a dose of 10 mGy (rad) can be linked with approx. 3 additional cases of mammary cancer reported on an average per year after the latency period. The fact that there is some statistical scatter around this value is chiefly attributable to age-related causes at the beginning of exposure. Differences in ethnic and cultural characteristics between the populations investigated appeared to be less important here. (orig./MG).

24871 (BfS-ISH–157/92) **Gestations and parturitions after the Chernoby1 reactor accident. A representative evaluation for the Federal Republic of Germany and Berlin (West). Final report.** Hoeltz, J. (Infratest Gesundheitsforschung, Muenchen (Germany)); Hoeltz, A.; Potthoff, P.; Brachner, A.; Grosche, B.; Hinz, G.; Kaul, A.; Martignoni, K.; Roedler, H.D.; Schwarz, E.; Tsavachidis, C. Bundesamt fuer Strahlenschutz, Neuherberg (Germany). Inst. fuer Strahlenhygiene. Sep 1992. 317p. (In German). Order Number DE93791918. Source: OSTI; NTIS (US Sales Only); INIS.

In the Federal Republic of Germany (former states) a cohort study was performed to find out, if there were any untoward pregnancy outcomes (preterm births) after the Chernobyl accident. It was also investigated, whether a possibly increased incidence of premature births was correlated to fears of the pregnant women for increased radiation exposure. The study was carried out in 3 stages: In the first stage (card-file monitoring) the data of 5,548 pregnant women (date of conception between April and August 1986) were taken from their gynaecologists' card-files, and in stage 2 and 3 (questionnaire/pregnancy record monitoring) 3,946 pregnant women (date of conception between January 1987 and February 1988) additionally filled in an extensive questionnaire. The influence of the following risk factors was studied: fears, smoking, drug consumption, biomedical and socio-economic factors. Both, in the card-file monitoring and the questionnaire, there was no statistically significant difference in the rate of preterm births in areas with different radiation exposure. From women living in areas with higher radiation exposure due to the Chernobyl fallout fears related to environmental risks were mentioned more frequently. There was a statistically significant increase in premature births for the risk factors smoking, psycho-drug consumption, and for biomedical risks as documented in the pregnancy records. When comparing this study with a similar one from 1981/1982, no difference in the rate of preterm births was observed. (orig.).

24872 (BNL–48723) **Time sequence of events leading to chromosomal aberration formation.** Moore, R.C. (Peter MacCallum Cancer Inst., Melbourne, VIC (Australia)); Bender, M.A. Brookhaven National Lab., Upton, NY (United States). [1993]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930295–2: 6. international environmental and molecular mutagenesis: the molecular basis of chromosomal aberrations, Castlemaine (Australia), 17-20 Feb 1993). Order Number DE93013339. Source: OSTI; NTIS; GPO Dep.

Investigations have been carried out on the influence of the repair polymerases on the yield of different types of chromosomal aberrations. The studies were mainly concerned with the effect of inhibiting the polymerases on the yield of aberrations. The polymerases fill in single-strand regions, and the fact that their inhibition affects the yield of aberrations suggests that single-strand lesions are influential in aberration formation. The results indicate that there are two actions of polymerases in clastogenesis. One is in their involvement in a G_2 repair system, in which either of the two chromatids is concerned, and which does not yield aberrations unless the inhibition is still operating when the cells enter mitosis. The second is such that when repair is inhibited, further damage accrues. The second action is affected by inhibiting polymerase repair, but also operates even when the repair enzymes are active. The production of chromosomal exchanges involves a series of reactions, some of which are reversible. The time span over which the reactions occur is much longer than has been envisaged previously.

24873 (BNL–48776) **Pilot study risk assessment for selected problems at the Savannah River Site (SRS).** Hamilton, L.D. (Brookhaven National Lab., Upton, NY (United States)); Holtzman, S.; Meinhold, A.; Morris, S.C.; Pardi, R.; Sun, C.; Daniels, J.I.; Layton, D.; McKone, T.E.; Straume, T.; Anspaugh, L. Brookhaven National Lab., Upton, NY (United States); Lawrence Livermore National Lab., CA (United States). Mar 1993. 82p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93012520. Source: OSTI; NTIS; INIS; GPO Dep.

An assessment of the health risks was made for releases of tritium and ^{137}Cs from the Savannah River Site (SRS) at water-receptor locations downriver. Although reactor operations were shut down at the SRS in 1989, liquid wastes continue to be released to the Savannah River either by direct discharges into on-site surface waters or by groundwater transport into surface waters from waste facilities. Existing state mandates will cause the liquid waste streams from future operations to go directly into surface waters. Two drinking water processing plants take water from the river approximately 129 km downriver from the SRS. Potential incremental risks of cancer fatality to individuals and each population were analyzed for either no further reactor operations or resumption of operation of one specific reactor.

24874 (CNIC–00625) **The relationship between lymphocytes activated by pokeweed mitogen and by lipopolysaccharides and their radiosensitivity.** Su Liaoyuan (Suzhou Medical Coll. (China)); Liu Fenju; Liu Keliang; Xu Changshao; Xu Yingdong; Geng Yongzhi. China Nuclear Information Centre, Beijing, BJ (China). Jul 1992. [12p.] (SMC–0080.). Order Number DE93625665. Source: OSTI; NTIS (US Sales Only); INIS.

Human whole blood was incubated in vitro. Lymphocytes were activated by poke-weed mitogen (PWM) and by Lipopolysaccharides (LPS). The relationship between the two kinds of lymphocytes was investigated using radioactive compound incorporation. The study showed that PWM-activated lymphocytes were able to promote the stimulating effect of LPS on B lymphocytes. The stimulating effect of PWM-activated lymphocytes was obviously decreased after they were irradiated with 10 Gy gamma rays. When PWM-activated lymphocytes and LPS-activated lymphocytes were incubated together after one of the cell populations had been exposed 10 Gy ^{60}Co gamma rays, the incorporation of [^{3}H] TdR was much decreased and the synergistic function disappeared, especially when the PWM-activated lymphocytes were irradiated. In cells from patients treated with ^{60}Co gamma rays for carcinoma of nasopharynx, the incorporation in LPS-activated lymphocytes approached normal levels while that in PWM-activated lymphocytes was reduced significantly and the stimulating effect of PWM-activated lymphocytes on LPS-activated lymphocytes was also markedly reduced. These demonstrate that PWM-activated lymphocytes have a similar function to T-helper cells and seem to be more radiosensitive than LPS-activated lymphocytes.

24875 (CONF-900679–13) **Feasibility of nuclear quadrupole resonance as a novel dosimetry tool.** Iselin, L.H.; Hintenlang, D.E.; Epperson, S.J.; Higgins, G.A.; Jamil, K. Florida Univ., Gainesville, FL (United States). Dept. of Nuclear Engineering Sciences; Oak Ridge Associated Universities, Inc., TN (United States). [1990]. 14p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract FG02-89ER12890 ;AC05-76OR00033. From 1990 Health Physics Society meeting; Anaheim, CA (United States); 24-28 Jun 1990. Order Number DE93010315. Source: OSTI; NTIS; INIS; GPO Dep.

Nuclear quadrupole resonance (N.Q.R) frequencies are influenced by the symmetry of the charge distribution of a compound

around the site of interest. Damage by ionizing radiation causes changes in this charge symmetry which can be detected by standard pulsed N.Q.R. methods. Previous work done on various chlorates of ^{35}Cl at room temperature (Vargas et al., 1978) shows a linear effect between absorbed gammadose and the N.Q.R. frequency shift and line broadening. This paper reviews the theory of N.Q.R. and details our experimental apparatus. The accumulated data on ^{14}N-containing compounds, both irradiated and nonirradiated, is discussed. The long term goal of this research is to choose an appropriate organic compound to duplicate the effects of radiation on human tissue. Under such conditions, we may be able to extend this work to provide a mixed radiation field (gamma and neutron) dosimeter which does not require knowing quality factors or energy fluences.

24876 (CONF-9211116–9) **Collection and control of tritium bioassay samples at Pantex.** Fairrow, N.L.; Ivie, W.E. Battelle Pantex, Amarillo, TX (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL65030. From 38. annual conference on bioassay, analytical and environmental radiochemistry; Santa Fe, NM (United States); 2-6 Nov 1992. Order Number DE93009922. Source: OSTI; NTIS; INIS; GPO Dep.

Pantex is the final assembly/disassembly point for US nuclear weapons. The Pantex internal dosimetry section monitors radiation workers once a month for tritium exposure. In order to manage collection and control of the bioassay specimens efficiently, a bar code system for collection of samples was developed and implemented to speed up the process and decrease the number of errors probable when transferring data. In the past, all the bioassay data from samples were entered manually into a computer database. Transferring the bioassay data from the liquid scintillation counter to each individual's dosimetry record required as much as two weeks of concentrated effort.

24877 (CONF-9304128–8) **Beta/gamma test problems for ITS.** Mei, G.T. Oak Ridge National Lab., TN (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. Order Number DE93013522. Source: OSTI; NTIS; INIS; GPO Dep.

The Integrated Tiger Series of Coupled Electron/Photon Monte Carlo Transport Codes (ITS 3.0, PC Version) was used at Oak Ridge National Laboratory (ORNL) to compare with and extend the experimental findings of the beta/gamma response of selected health physics instruments. In order to assure that ITS gives correct results, several beta/gamma problems have been tested. ITS was used to simulate these problems numerically, and results for each were compared to the problem's experimental or analytical results. ITS successfully predicted the experimental or analytical results of all tested problems within the statistical uncertainty inherent in the Monte Carlo method.

24878 (DOE/ER/60539–11) **The oncogenic action of ionizing radiation on rat skin: Final progress report, May 1, 1990–April 30, 1992.** Burns, F.J.; Garte, S.J. New York Univ., NY (United States). Dept. of Environmental Medicine. 1992. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER60539. Order Number DE93015580. Source: OSTI; NTIS; GPO Dep.

The multistage theory of carcinogenesis specifies that cells progress to cancer through a series of discrete, irreversible genetic alterations, but data on radiation-induced cancer incidence in rat skin suggests that an intermediate repairable alteration may occur. Data are presented on cancer induction in rat skin exposed to an electron beam (LET=0.34 keV/μ), a neon ion beam (LET=45) or an argon ion beam (LET=125). The rats were observed for tumors at least 78 weeks with squamous and basal cell carcinomas observed. The total cancer yield was fitted by the quadratic equation, and the equation parameters were estimated by linear regression for each type of radiation. Analysis of the DNA from the electron-induced carcinomas indicated that K-ras and/or c-myc oncogenes were activated. In situ hybridization indicated that the cancers contain subpopulations of cells with differing amounts of c-myc and H-ras amplification. The results are consistent with the idea that ionizing radiation produces stable, carcinogenically relevant lesions via 2 repairable events at low LET and via a non-repairable linked event pathway at high LET; either pathway may advance the cell by 1 stage. The proliferative response of rat epidermis following exposure to ionizing radiation was quantified by injection of ^{14}C-thymidine. The return of these cells to S-phase a second time was detected by a second label (^{3}H). When the labeled cells were in G1-phase, the dorsal skin was irradiated with X-rays. All labeling indices were determined. The ^{14}C labeling index was constant and unaffected by the radiation. The proportion of all cells entering S-phase averaged 3.5% at 18 hr and increased after 44, 52 and 75 hr to average levels of 11.8%, 5. 3%, and 6.6% at 0, 10 and 25 Gy respectively. The proportion of S-phase cells labeled with ^{14}C increased after 42 hr and remained relatively constant thereafter.

24879 (DOE/FTR–93011663) **[Travel to Germany and France for standardized nomenclature on the histologic interpretation of lung tumors induced in rats]: Foreign trip report, October 2–14, 1992.** Dagle, G.E. Pacific Northwest Lab., Richland, WA (United States). 11 Nov 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93011663. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The principal purpose of the travel was to participate in a workshop to he l standardize nomenclature on the histologic interpretation of lung tumors induced in rats with radon progeny and other inhaled hazardous materials. This workshop, held in Paris, France, October 12–13, 1992, was organized by the European Late Effects Project Group (EULEP) with participation from the Biological Effects Task Group (BETG) of the US Department of Energy, Office of Health and Environmental Research (OHER). The dates of this workshop were such that they allowed participation of the traveler in the annual meeting of the European Society for Radiation Biology, in Erfurt, Germany, October 4–8, 1992. An ancillary visit was made to the German Cancer Research Center, in Heidelberg, Germany, October 9, 1992, to discuss research with Drs. Horst Wesch and Andres Spiethoff at the Institute for Radiology and Pathophysiology.

24880 (DOE/FTR–93013012) **[Travel to Japan regarding interaction between internally deposited radioactive materials and acute gamma ray exposures in the production of chromosome aberrations]: Foreign trip report, July 11–19, 1992.** Brooks, A.L. Pacific Northwest Lab., Richland, WA (United States). 12 Aug 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93013012. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This trip was taken to provide Dr. Brooks an opportunity to present his research results on the interaction between internally deposited radioactive materials (^{144}Ce and ^{239}Pu) and acute gamma ray exposures in the production of chromosome aberrations. The secondary purpose was to interact with scientists from around the world on the potential biological changes induced in cells and organisms by very low doses of ionizing radiation. This meeting provided a wide range of discussions on low levels of radiation that ranged from the human epidemiology studies to studies on the mechanisms involved in the induction of repair proteins at very low doses of radiation. The meeting was very valuable in helping to shape the future of the research to be conducted in the Cell and mammalian Biology section at the Pacific North West Laboratory.

24881 (DOE-RAS–92.001) **Whole body monitoring of the population of Cambridgeshire: April 1988 - March 1991.** Dendy, P.P. (Addenbrooke's Hospital, Cambridge (United Kingdom)); Hayball, M.P.; Lyttle, K.D. Department of the Environment, London (United Kingdom). Radioactive Substances Div. 1992. [34p.] Contract PECD-7/9/477;WBM/88. Order Number DE93624586. Source: OSTI; NTIS (US Sales Only); INIS.

1220 volunteers were monitored using the Addenbrookes whole-body counter and their spectra and results were stored and analysed. Detailed statistical analyses have been made for 1032 volunteers who were Cambridgeshire residents. After tracking the decline of radiocaesium following Chernobyl, figures were established for the maximum likely average level of body contamination

of radiocaesium and the practical level of detectability of radioiodine. Other radionuclides were occasionally detected in volunteers but the reason could be readily determined and activities were always low. Results are available in a conveniently recoverable form and the spectra can be examined for the presence of other radionuclides if necessary. (author).

24882 (DOE-RAS–92.002) **Measurements of whole-body radioactivity in the UK population.** Fenwick, J.D. (Northern Regional Health Authority (United Kingdom). Regional Medical Physics Dept.); Boddy, K.; McKenzie, A.L.; Oxby, C.B. Department of the Environment, London (United Kingdom). Radioactive Substances Div. 1992. [74p.] Contract PECD-7/9/477. Order Number DE93624587. Source: OSTI; NTIS (US Sales Only); INIS.

A national survey of whole-body radioactivity was undertaken. A mobile whole-body counter visited collaborating Medical Physics Departments and Hospitals in England and Wales. Data were also obtained from an installed whole-body counter at the West Cumberland Hospital, Whitehaven, and from a control site at Addenbrooke's Hospital, Cambridge. 1657 volunteer members of the public were measured, including 162 children. 36% of volunteers had been measured in a similar survey 2 years earlier, and showed between a two and five fold reduction in body radiocaesium. No radiocaesium was detected in 54% of people measured. Measurements showed a progressive fall over the course of the study, reaching a baseline of 0.3 Bq^{137}Cs/gK. In 1989, the additional radiation dose incurred from radiocaesium varied from a maximum of 4.1 μSv in Cumbria to 1.5 μSv in the South East, compared with the average annual radiation dose of 2500 μSv due to all other causes. No other gamma-emitting radionuclides were found. Results are consistent with Chernobyl as the source of the radiocaesium detected. (author).

24883 (DOE/SR/18217–1) **Cancer and birth defects surveillance system for communities around the Savannah River Site: Savannah River Region Health Information System (SRRHIS): Annual progress report.** Dunbar, J.B. Medical Univ. of South Carolina, Charleston, SC (United States). Dept. of Biostatistics, Epidemiology, and System Sciences. May 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-91SR18217. Order Number DE93014442. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes efforts directed at establishing a registry of cancers and birth defects that could be associated with activities at the Savannah River Plant.

24884 (INIS-mf–13503, pp. 43-45) **Occupational radiation exposures during maintenance shutdown at Czechoslovak NPPs.** Burclova, J. (Vyskumny Ustav Jadrovych Elektrarni, Trnava (Czechoslovakia)). European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

Several graphs are presented giving the dependence of the cumulative occupational radiation exposure on energy production in Czechoslovak and some western PWRs, and the occupational radiation exposure for WWER-440 (type 230) reactors versus duration of the shutdown for reactor maintenance. (Z.S.) 5 figs.

24885 (INIS-mf–13518, pp. Z9) **Natural radionuclide content of some components of the environment as affected by the geologic structure of the Pribram geologic region.** Solnicka, H. The brochure tries to make understandable also for nonprofessionals the conncetion between radioactivity and health. After briefly discussing the foundations of radioactivity, radiation emanating from radioactive materials, and the terms of dose, it deals with natural and man-made exposure of man in the age of industry. Its effects on man are thoroughly considered with regard to possible health injuries and genotype changes. The explanation of radioecological correlations, from radioactive effluents from nuclear installations to the determination of radiation exposure of man, takes into account effluents during normal operation and effluents caused by accidents, giving as an example the Chernobyl reactor accident. It is supplemented by describing the risks involved in the application of ionizing radiation in medicine. Subsequent chapters

reflect the results obtained in many years of research into questions of radiation hazards, and they are to contribute to a matter-of-fact information about this important area. A comprehensive bibliography facilitates access to specialized literature. (orig.).

24891 (INIS-mf–14147) **Volume of baseline data on radioactivity in drinking water, ground water, waste water, sewage sludge, residues and wastes of the annual report 1988 'Environmental radioactivity and radiation exposure'.** WaBoLu-Hefte. Abelmann, S.; Buenger, T.; Fusban, H.U.; Ruehle, H.; Viertel, H.; Gans, I. Bundesgesundheitsamt, Berlin (Germany). Inst. fuer Wasser-, Boden- und Lufthygiene. 1991. 209p. (In German). Order Number DE93795221. Source: OSTI; NTIS (US Sales Only); INIS.

This WaBoLu volume is a shortened version of the annual report by the Federal Ministry of the Environment, Nature Protection and Reactor Safety 'Environmental radioactivity and radiation exposure' and gives an overview of the data on radioactivity in drinking water, ground water, waste water, sewage sludge, residues and wastes, compiled for the area of the Federal Republic of Germany in 1988 by the Institute of Water, Soil and Air Hygiene (WaBoLu) of the Federal Health Office. (BBR) With 22 figs., 15 tabs.

24892 (JAERI-M–93-025) **System for keeping atmospheric pressure in nuclear facility and its peripheral equipments.** Matsumoto, Hatsuo (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1993. 76p. (In Japanese). Order Number DE93797611. Source: OSTI; NTIS; INIS.

The design to keep radioactive materials in the facility and not to make them spread inside the facility and into the environments is an essential issue in the construction of nuclear facilities. One reason of the contamination is due to the diffusion with air flow, therefore, negative pressure for the ambients has been utilized to keep gaseous radioactivities inside the facility of interest. The pressure difference is not so large, though, the atmospheric pressure level of the contaminated and possibly contaminated areas are always kept to be lower than those of the ambient one to prevent the dissemination of radioactivity from the defined area. The technique using negative pressure, at present, is employed widely in nuclear facilities, and the basic system is the same as that of JRR-1 built as the first nuclear facility in Japan. In the present work, the conventional system with negative pressure was reexamined on the sate-of-art of the regulations for the nuclear facilities, and consequently some shortages of the system has been found. Thus, an advanced system with an excellent performance keeping the negative pressure has been developed to cover the shortage. In this report, the new system is introduced with a couple of comments, acquired from the author's experience, to the design and the maintenance of the composite equipments of the system. (author).

24893 (KURRI-TR–373) **The records of radiation control division, No. 27: April, 1990 - March, 1992.** Saito, Masahiro (ed.) (and others); Ikushima, Takaji; Fukui, Masami. Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. Mar 1993. 91p. (In Japanese). Order Number DE93797621. Source: OSTI; NTIS; INIS.

The Radiation Control Division consists of three sections : Indoor Radiation Control, Field Radiation Monitoring, and Individual Monitoring sections. Nineteen members, including research scientists and technicians, are now organized for the safety-oriented operation of the nuclear reactor, the safety-management of the laboratory works in the hot area. The present report summarizes the safety management carried out by these three sections during April 1990 - March 1992. Additionally, the tasks managed by the staff of Office of Health Physics are described. (author).

24894 (LA-SUB–93-74) **MACCS versus GENII: Code comparison.** Foster, J. (Technadyne Engineering Consultants, Inc., Albuquerque, NM (United States)); Chanin, D.I. Los Alamos National Lab., NM (United States); Technadyne Engineering Consultants, Inc., Albuquerque, NM (United States). 30 Sep 1991. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93008468. Source: OSTI; INIS; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020; GPO Dep.

The computer codes GENII and MACCS, utilized for computing radiation doses, are discussed. The codes are compared from input from the source term from LANL file HW101-SY.INP, run dated 2/19/91. The release of radionuclides was assumed to be from a point source at ground level with a 10 minute release duration.Doses were calculated at a distance of 660 meters with an exposure duration of 2 hours. It was found that the 2 codes differed in how wind direction was treated.

24895 (LA-UR–93-747) **Report on high energy neutron dosimetry workshop.** Alvar, K.R.; Gavron, A. Los Alamos National Lab., NM (United States). 27 Jan 1993. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9211228–1: High energy neutron dosimetry workshop, Gaithersburg, MD (United States), 19 Nov 1992). Order Number DE93010729. Source: OSTI; NTIS; INIS; GPO Dep.

The workshop was called to assess the performance of neutron dosimetry per the responses from ten DOE accelerator facilities to an Office of Energy Research questionnaire regarding implementation of a personnel dosimetry requirement in DRAFT DOE 5480.ACC, "Safety of Accelerator Facilities". The goals of the workshop were to assess the state of dosimetry at high energy accelerators and if such dosimetry requires improvement, to reach consensus on how to proceed with such improvements. There were 22 attendees, from DOE Programs and contract facilities, DOE, Office of Energy Research (ER), Office of Environmental Safety and Health (EH), Office of Fusion Energy, and the DOE high energy accelerator facilities. A list of attendees and the meeting agenda are attached. Copies of the presentations are also attached.

24896 (LMF–138) **Inhalation Toxicology Research Institute annual report, October 1, 1991–September 30, 1992.** Finch, G.L.; Nikula, K.J.; Bradley, P.L. (eds.). Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM (United States). Inhalation Toxicology Research Inst. Dec 1992. 288p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76EV01013. Order Number DE93013024. Source: OSTI; NTIS; INIS; GPO Dep.

The mission of ITRI is to conduct basic and applied research to improve our understanding of the nature and magnitude of the human health impacts of inhaling airborne materials in the home, workplace, and general environment. Institute research programs have a strong basic science orientation with emphasis on the nature and behavior of airborne materials, the fundamental biology of the respiratory tract, the fate of inhaled materials and the mechanisms by which they cause disease, and the means by which data produced in the laboratory can be used to estimate risks to human health. The papers in this annual report are organized along topical lines, rather than by research program, so that research within specific disciplines is more readily identified. The papers include summaries of research funded by both DOE and non-DOE sources, to represent the full scope of Institute activities. One section consists of summaries of research on the effects of injected actinides, conducted for DOE at the University of Utah.

24897 (NEI-NO–330) **Studies on levels and interactions of contact activation factors in plasma: A basis for the elucidation of their function in anaphylactoid reactions to dextran and to radiographic contrast media.** Hoem, N.O. Oslo Univ. (Norway). 1992. [102p.] Order Number DE93625751. Source: OSTI; NTIS; INIS.

Reprints of eight previously printed papers are attached.

Summary of findings and conclusions of relevance: A part of the thesis concerns the effects of intravenous contrast media on the blood pressure and on factors of the contact activation system in the rat. The intravenous injection of dextran induced a profound and lasting fall in blood pressure, preceded by significant lowering in prekallikrein and activation factor 12. The non-ionic radiographic contrast media iohexol caused no significant alterations, neither in blood pressure, nor in levels of contact factors, whereas the ionic radiographic contrast media iodipamide had effects. It induced a rapid, but short-lived, fall in blood pressure and a small, but statistically significant reduction in the measurable amount of activation factor 12a. An observation of significance was that pretreatment of the rats with iodipamide almost blocked the dextran-induced blood pressure fall, and abolished the reduction in prekallikrein and activation factor 12a. It is concluded that the ionic radiographic

contrast media used was capable of blocking dextran shock in the rat by preventing an activation of contact activation system. 130 refs., 5 figs.

24898 (ORNL/FTR–4257) **Travel to Sweden to participate in the Seminar on the Dynamic Behavior of Radionuclides in Forests: Foreign trip report, May 16–23, 1992.** Garten, C.T. Jr. Oak Ridge National Lab., TN (United States). 3 Jun 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011080. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Swedish Radiation Protection Institute (SSI) hosted a one-week conference, Seminar on the Dynamic Behavior of Radionuclides in Forests, at the Norra Latin Conference Center in Stockholm from May 18 to May 22, 1992. The traveler presented an introductory paper on behalf of F. Owen Hoffman, Oak Ridge National Laboratory, in the session on Deposition and Interception of Radionuclides by Forests and chaired the session Contamination of Wildlife in which the traveler presented a paper on dispersal of radioactivity by wildlife. There was considerable international interest in the topic of this conference; 86 participants representing more than 20 countries were there, and there were more than 75 plenary, oral, or poster presentations. Scientists from the former Union of Soviet Socialist Republics (USS.R) made significant and interesting presentations based on studies of radioactive forests at Kyshtym and Chernobyl. The format of the meeting included both formal presentations and a one-day workshop that addressed environmental issues centered on four broad themes relating to forest habitats and radioactive contamination. CEC will arrange for papers at the seminar to be published in a special volume of the journal Science of the environment.

24899 (ORNL/TM–11916) **Improving neutron dosimetry using bubble detector technology.** Buckner, M.A. Oak Ridge National Lab., TN (United States). Feb 1993. 96p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93013453. Source: OSTI; NTIS; INIS; GPO Dep.

Providing accurate neutron dosimetry for a variety of neutron energy spectra is a formidable task for any dosimetry system. Unless something is known about the neutron spectrum prior to processing the dosimeter, the calculated dose may vary greatly from that actually encountered; that is until now. The entrance of bubble detector technology into the field of neutron dosimetry has eliminated the necessity of having an a priori knowledge of the neutron energy spectra. Recently, a new approach in measuring personnel neutron dose equivalent was developed at Oak Ridge National Laboratory. By using bubble detectors in combination with current thermoluminescent dosimeters (TLDs) as a Combination Personnel Neutron Dosimeter (CPND), not only is it possible to provide accurate dose equivalent results, but a simple four-interval neutron energy spectrum is obtained as well. The components of the CPND are a Harshaw albedo TLD and two bubble detectors with theoretical energy thresholds of 100 key and 1500 keV. Presented are (1) a synoptic history surrounding emergence of bubble detector technology, (2) a brief overview of the current theory on mechanisms of interaction, (3) the data and analysis process involved in refining the response functions, (4) performance evaluation of the original CPND and a reevaluation of the same data under the modified method, (5) the procedure used to determine the reference values of component fluence and dose equivalent for field assessment, (6) analysis of the after-modification results, (7) a critique of some currently held assumptions, offering some alternative explanations, and (8) thoughts concerning potential applications and directions for future research.

24900 (ORNL/TM–12148) **Resolution of dose and reduction factor questions in Army Pulse Radiation Facility experiments: Renormalization of calculated and measured data.** Santoro, R.T.; Drischler, J.D.; Johnson, J.O. Oak Ridge National Lab., TN (United States). Nov 1992. 27p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012507. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A procedure is introduced to normalize calculated and measured dose and reduction factors for a series of experiments performed at the Army Pulse Radiation Facility. In an attempt to isolate causes of the differences among these data, the data are reevaluated on the basis that the free-field neutron and gamma-ray fluence at 400 m from the reactor should be constant within air and ground moisture conditions. When the dose data are compared relative to the number of free-field neutrons, significant improvements are realized in the calculated-to measured data ratios. Discrepancies in previously reported results appear to be traceable to differences in the number of free-field neutrons and the γ/n ratio at the measurement location.

24901 (PNL–3777-Rev.2) **Recommended environmental dose calculation methods and Hanford-specific parameters: Revision 2.** Schreckhise, R.G. (Pacific Northwest Lab., Richland, WA (United States)); Rhoads, K.; Napier, B.A.; Ramsdell, J.V.; Davis, J.S. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 272p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93012832. Source: OSTI; NTIS; INIS; GPO Dep.

This document was developed to support the Hanford Environmental Dose overview Panel (HEDOP). The Panel is responsible for reviewing all assessments of potential doses received by humans and other biota resulting from the actual or possible environmental releases of radioactive and other hazardous materials from facilities and/or operations belonging to the US Department of Energy on the Hanford Site in south-central Washington. This document serves as a guide to be used for developing estimates of potential radiation doses, or other measures of risk or health impacts, to people and other biota in the environs on and around the Hanford Site. It provides information to develop technically sound estimates of exposure (i.e., potential or actual) to humans or other biotic receptors that could result from the environmental transport of potentially harmful materials that have been, or could be, released from Hanford operations or facilities. Parameter values and information that are specific to the Hanford environs as well as other supporting material are included in this document.

24902 (PNL-SA–21011) **Bioassay criteria for environmental restoration workers.** Carbaugh, E.H.; Bihl, D.E. Pacific Northwest Lab., Richland, WA (United States). Jan 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930130–9: 26. Health Physics Society midyear topical meeting on environmental health physics, Coeur d'Alene, ID (United States), 24-28 Jan 1993). Order Number DE93007997. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental restoration (ER) work at the U. S. Department of Energy Hanford Site posed questions concerning when to perform bioassay monitoring of workers for potential intakes of radioactivity. Application of criteria originally developed for use inside radionuclide processing facilities to ER work resulted in overly restrictive bioassay requirements. ER work typically involves site characterization or, excavating large quantities of potentially contaminated soil, rather than working with concentrated quantities of radioactivity as in a processing facility. An improved approach, tailored to ER work, provided soil contamination concentrations above which worker bioassay would be required. Soil concentrations were derived assuming acute or chronic intakes of 2% of an Annual Limit on Intake (ALI), or a potential committed effective dose equivalent of 100 mrem, and conservative dust loading of air from the work. When planning ER work, the anticipated soil concentration and corresponding need for bioassay could be estimated from work-site historical records. Once site work commenced, soil sampling and work-place surveys could be used to determine bioassay needs. This approach substantially reduced the required number of bioassay samples with corresponding reductions in analytical costs, schedules, and more flexible work-force management. (Work supported by the US Department of Energy under contract DOE-AC06-76RLO 1830.)

24903 (PNL-SA–21014) **Identification of environmentally derived cesium-137 burdens in a worker population.** MacLellan, J.A.; Lynch, T.P.; Rieksts, G.A.; Brodzinski, R.L. Pacific Northwest Lab., Richland, WA (United States). Jan 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930130–10: 26. Health Physics Society midyear topical meeting on environmental health physics, Coeur

d'Alene, ID (United States), 24-28 Jan 1993). Order Number DE93007996. Source: OSTI; NTIS; INIS; GPO Dep.

During 1990, whole body measurements of a number of workers with little probability of onsite occupational exposure showed positive evidence of ^{137}Cs. Further investigation revealed that many of these workers supplemented their diet with a significant portion of wild game, mainly deer and elk. To validate the assumption of an environmental source, donated samples of venison and other game were analyzed by gamma spectroscopy. Results ranged from less than 0.1 to almost 100 Bq kg^{-1} (0.003 to 2.7 nCi kg^{-1}) and showed a correlation with the habitat from which the game was taken. Venison samples obtained from the two workers with the highest body burdens showed the highest activity. A questionnaire is now used to identify workers with an elevated potential for environmental-intakes.

24904 (PNL-SA–21972) **Development and maintenance of the Hanford Site Radiological Control Manual.** Munson, L.H.; Selby, J.M; Vargo, G.J.; Clark, D.L. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9304128–7: Department of Energy (DOE) radiation protection conference, Las Vegas, NV (United States), 13-15 Apr 1993). Order Number DE93013158. Source: OSTI; NTIS; INIS; GPO Dep.

In June 1992 the US Department of Energy (DOE) issued DOE N5480.6, Radiological Control, which set forth DOE's Radiological Control Program and established the framework for its implementation at sites nationwide. Accompanying the Order was the DOE Radiological Control Manual (DOE RCM), which provided the detailed requirements for the program. The Order also mandated Field Office issuance of site-specific radiological control manuals by December 1, 1992. This paper presents the approach taken to develop, review, approve, implement, and subsequently maintain the site-specific manual for the DOE Richland Field Office (RL) at Hanford Site.

24905 (PNL-SA–22241) **Personnel dose assignment practices.** Fix, J.J. Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9304128–1: Department of Energy (DOE) radiation protection conference, Las Vegas, NV (United States), 13-15 Apr 1993). Order Number DE93013285. Source: OSTI; NTIS; INIS; GPO Dep.

Implementation of DOE N 5480.6 Radiological Control Manual Article 511(3) requirements, to minimize the assignment of personnel dosimeters, should be done only under a broader context ensuring that capabilities are in place to monitor and record personnel exposure both for compliance and for potential litigation. As noted in NCRP Report No. 114, personnel dosimetry programs are conducted to meet four major objectives: radiation safety program control and evaluation; regulatory compliance; epidemiological research; and litigation. A change to Article 511(3) is proposed that would require that minimizing the assignment of personnel dosimeters take place only following full evaluation of overall capabilities (e.g., access control, area dosimetry, etc.) to meet the NCRP objectives.

24906 (PNWD–1980-10-HEDR) **Hanford Environmental Dose Reconstruction Project monthly report, March 1993.** Cannon, S.D.; Finch, S.M. (comps.). Battelle Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 57p. Sponsored by Department of Health and Human Services, Washington, DC (United States). Order Number DE93012321. Source: OSTI; NTIS; INIS.

The objective of the Hanford Environmental Dose Reconstruction (HEDR) Project is to estimate the radiation doses that individuals and populations could have received from nuclear operations at Hanford since 1944. The project is divided into the following technical tasks. These tasks correspond to the path radionuclides followed from release to impact on humans (dose estimates): Source Terms, Environmental Transport, Environmental Monitoring Data, Demography, Food Consumption, and Agriculture and Environmental Pathways and Dose Estimates.

24907 (PNWD–2020-HEDR) **Integrated task plans for the Hanford Environmental Dose Reconstruction Project, FY 1992 through May 1994.** Shipler, D.B. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 247p. Sponsored by Department of Health and Human Services, Washington, DC (United States). Order Number DE93011651. Source: OSTI; NTIS; INIS.

The purpose of the Hanford Environmental Dose Reconstruction (HEDR) Project is to estimate radiation doses from Hanford Site operations since 1944 to real and representative individuals. The primary objective of work to be performed through May 1994 is to (1) determine the project's appropriate scope (space, time, radionuclides, pathways, and representative individuals), (2) determine the project's appropriate level of accuracy (level of uncertainty in dose estimates), (3) complete model and data development, and (4) estimate doses for the Hanford Thyroid Disease Study (HTDS), representative individuals, and other real individuals as described herein. This document was prepared to address modifications and work revisions.

24908 (PNWD–2033-HEDR-Vol.1) **Iodine-131 releases from the Hanford Site, 1944–1947: Volume 1, Text: Hanford Environmental Dose Reconstruction Project.** Heeb, C.M. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 133p. Sponsored by Department of Health and Human Services, Washington, DC (United States). DOE Contract AC06-76RL01830. Contract 200-92-0503(CDC)/18620(BNW). Order Number DE93011909. Source: OSTI; NTIS; INIS; GPO Dep.

Releases of fission product iodine-131 are calculated for the 1944 through 1947 period from the Hanford Reservation. Releases to the atmosphere were from the ventilation stacks of T and B separation plants. A reconstruction of daily separation plant operations forms the basis of the releases. The reconstruction traces the iodine-131 content of each fuel discharge from the B, D, and F Reactors to the dissolving step in the separation plants. Statistical computer modeling techniques are used to estimate hourly release histories based on sampling mathematical distribution functions that express the uncertainties in the source data and timing. The reported daily, monthly, and yearly estimates are averages and uncertainty ranges are based on 100 independent Monte Carlo "realizations" of the hourly release histories.

24909 (PNWD–2113-HEDR-Draft) **Estimation of 1945 to 1957 food consumption: Hanford Environmental Dose Reconstruction Project: Draft.** Anderson, D.M.; Bates, D.J.; Marsh, T.L. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 171p. Sponsored by Department of Health and Human Services, Washington, DC (United States). DOE Contract AC06-76RL01830. Contract 200-92-0503(CDC);Contract 18620(BNW). Order Number DE93011017. Source: OSTI; NTIS; GPO Dep.

This report details the methods used and the results of the study on the estimated historic levels of food consumption by individuals in the Hanford Environmental Dose Reconstruction (HEDR) study area from 1945–1957. This period includes the time of highest releases from Hanford and is the period for which data are being collected in the Hanford Thyroid Disease Study. These estimates provide the food-consumption inputs for the HEDR database of individual diets. This database will be an input file in the Hanford Environmental Dose Reconstruction Integrated Code (HEDRIC) computer model that will be used to calculate the radiation dose. The report focuses on fresh milk, eggs, lettuce, and spinach. These foods were chosen because they have been found to be significant contributors to radiation dose based on the Technical Steering Panel dose decision level.

24910 (PNWD–2129-HEDR) **List of currently classified documents relative to Hanford Production Facilities Operations originated on the Hanford Site between 1961 and 1972.** Battelle Pacific Northwest Lab., Richland, WA (United States). Apr 1993. 255p. Sponsored by Department of Health and Human Services, Washington, DC (United States). DOE Contract AC06-76RL01830. Contract 200-92-0503(CDC)/18620(BNW). Order Number DE93012621. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The United States Department of Energy (DOE) has declared that all Hanford plutonium production- and operations-related information generated between 1944 and 1972 is declassified. Any documents found and deemed useful for meeting Hanford Environmental Dose Reconstruction (HEDR) objectives may be declassified with or without deletions in accordance with DOE guidance by Authorized Derivative Declassifiers. The September 1992,

letter report, Declassifications Requested by the Technical Steering Panel of Hanford Documents Produced 1944–1960, (PNWD-2024 HEDR UC-707), provides an important milestone toward achieving a complete listing of documents that may be useful to the HEDR Project. The attached listing of approximately 7,000 currently classified Hanford-originated documents relative to Hanford Production Facilities Operations between 1961 and 1972 fulfills TSP Directive 89-3. This list does not include such titles as the Irradiation Processing Department, Chemical Processing Department, and Hanford Laboratory Operations monthly reports generated after 1960 which have been previously declassified with minor deletions and made publicly available. Also Kaiser Engineers Hanford (KEH) Document Control determined that no KEH documents generated between January 1, 1961 and December 31, 1972 are currently classified. Titles which address work for others have not been included because Hanford Site contractors currently having custodial responsibility for these documents do not have the authority to determine whether other than their own staff have on file an appropriate need-to-know. Furthermore, these documents do not normally contain information relative to Hanford Site operations.

24911 (SR/H–522) **[Function and organization of the Medical Department of the Hanford Engineer Works].** Norwood, W.D.; Meekins, R.L.; Cantril, S.T.; Fuqua, P.A. Hanford Engineer Works, Richland, WA (United States). [1946]. 133p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. Order Number DE93012362. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Medical Department of the Hanford Engineer Works is responsible for providing medical and dental service to the plant employees and the Village residents. This function entails the operation of Kadlec Hospital and the Medical-Dental Clinic, as well as all activities of the Public Health Section, the Plant Medical Section, and the Health Instrument Section. The latter two Sections together comprise the Industrial Medical Division of the department. This memorandum reviews the functions and organization of the Medical Department from its inception to August 1946. Included also is a summary of experience with the procurement and training of personnel.

24912 (UCRL-ID–111417) **Proposed performance degradation algorithms for multiburst environments.** Olness, D.U.; Warshawsky, A.S. Lawrence Livermore National Lab., CA (United States). 23 Jun 1992. 12p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. Contract IACRO 91-808. Order Number DE93013308. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This work is a part of an ongoing effort of the Defense Nuclear Agency's Intermediate Dose Program (IDP) to investigate the effects of intermediate radiation doses on combat unit performance. The objective of this study is to develop a technique for applying performance degradation factors to combat crews in simulated battles following a second or third nuclear attack. In this paper, the authors describe three methods they have identified.

24913 (UCRL-JC–109590) **The role of x-ray induced damage in biological micro-imaging.** London, R.A. (Lawrence Livermore National Lab., CA (United States)); Trebes, J.E.; Jacobsen, C.J. Lawrence Livermore National Lab., CA (United States). Oct 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920792–55: Society of Photo-Optical Instrumentation Engineers (SPIE) international symposium on optical applied science and engineering, San Diego, CA (United States), 19-24 Jul 1992). Order Number DE93013353. Source: OSTI; NTIS; GPO Dep.

Interactions of x rays with a sample are studied to determine the optimal wavelength, source energy and exposure time for microscopy and holography. The optimal wavelength is influenced by two criteria: minimizing the required source energy and minimizing the absorbed dose and subsequent damage to the sample. The use of heavy element labels, such as colloidal gold can significantly reduce the energy and dose. Limits to the exposure time due to natural motions, x-ray induced chemical damage, heat build-up, and hydrodynamic expansion are discussed.

24914 (WSRC-MS–93-067) **Radiological comparison guideline and nuclear safety goals.** Kim, K.S.; Bradley, R.F. Westinghouse Savannah River Co., Aiken, SC (United States). [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9306143–3: Energy Facility Contractors Group safety analysis meeting, Denver, CO (United States), 16-18 Jun 1993). Order Number DE93012133. Source: OSTI; NTIS; INIS; GPO Dep.

The Westinghouse Managing and Operating (M&O) Contractors Nuclear Facility Safety Committee proposed a guideline for radiological risk comparison . The M&O guideline, (as a form of Limit Line) is intended to be used for evaluating the acceptability of consequences and associated frequency/probability of individual accident events. That is, the guideline is a Farmer's Limit Line rather than a Limit Line based on the complementary cumulative distribution function (CCDF).

24915 (Y/DQ–39) **A model for uranium lung clearance at the Y-12 Plant.** Barber, J.M.; Forrest, R. Oak Ridge Y-12 Plant, TN (United States). 2 Mar 1992. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE93013255. Source: OSTI; NTIS; INIS; GPO Dep.

Previous examinations of Y-12 bioassay data have shown. with the exception of five anomalous cases, the typical hall clearance time for uranium in the lung to be approximately 120 days. These findings are consistent with those of a fuel fabrication facility in Germany. The Y-12 study investigated human exposure to the least transportable uranium materials commonly found (U_3O_8 and UO_2) at the Y-12 Plant. Use of a deposition and retention model based on exposure to these forms would be conservative for other chemical forms of uranium normally processed at the plant. Particle-size and lung-clearance studies were made in order to collect of observed bioassay data. Particle-size data for a model more representative determinations were made by using electron microscopy on independent air samples taken during periods of production as well as during periods of nonproduction. The lung-clearance study was a two-part investigation. The first part consisted of a further analysis of historical personnel exposure cases involving uranium oxides. These cases included individuals who were restricted from uranium work for six months or longer because their bioassay results exceeded the criteria for restriction. The second part consisted of a contemporary study which examined uranium clearance from several individuals removed from low-level chronic uranium exposure specifically for this study. The individuals involved in the contemporary study were chosen because their work areas and historical bioassay data indicated low-level chronic exposure to uranium oxides for 10 or longer.

24916 (Y/DQ–40) **Technical basis for the internal dosimetry program at the Y-12 Plant.** Ashley, J.C.; Barber, J.M.; Snapp, L.M.; Turner, J.E. Oak Ridge Y-12 Plant, TN (United States). 2 Mar 1992. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE93013256. Source: OSTI; NTIS; INIS; GPO Dep.

Since the beginning of plant operations. almost all work with radioactive materials has involved isotopes associated with uranium, enriched or depleted in U^{235}. While limited quantities of isotopes of elements other than uranium are present, workplace monitoring and precess knowledge have established that internal exposure from these other isotopes is insignificant in comparison with uranium. While the changing plant mission may necessitate the consideration of internal exposure from other isotopes at some point in time, only enriched and depleted uranium will be considered in this basis document. The portions of the internal dosimetry technical basis which may be unique to the Y-12 Plant is considered in this manual. This manual presents the technical basis of the routine in vivo and in vitro bioassay programs including choice of frequency, participant selection criteria, and action level guidelines. Protocols for special bioassay will be presented in the chapters which described the basis for intake, uptake, and dam assessment. A discussion of the factors which led to the need to develop a special biokinetic model for uranium at the Y-12 Plant, as well as a description of the model's basic parameters, are included in this document.

24917 (ANL–93/7) **Lead exposures and biological responses in military weapons systems: Aerosol characteristics and acute lead effects among US Army artillerymen: Final report.** Bhattacharyya, M.H.; Stebbings, J.H.; Peterson, D.P.; Johnson, S.A.; Kumar, R.; Goun, B.D.; Janssen, I.; Trier, J.E. Argonne National Lab., IL (United States). Mar 1993. 138p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93012075. Source: OSTI; NTIS; GPO Dep.

This study was to determine the concentration and chemical nature of lead (Pb) aerosols produced during the firing of artillery and to determine the exposures and biological responses of crew members exposed to lead aerosols during such firing. The concentrations of lead-containing aerosols at crew positions depended on wind conditions, with higher concentrations when firing into a head wind. Aerosol concentrations were highest in the muzzle blast zone. Concentrations of lead in the blood of crew members rose during the first 12 days of exposure to elevated airborne lead concentrations and then leveled off. There was no rapid decrease in blood lead concentrations after completion of firing. Small decreases in hematocrit and small increases in free erythrocyte porphyrin were correlated with increasing exposure to airborne lead. These changes were reversed by seven weeks after firing. Changes in nerve conduction velocity had borderline statistical significance to airborne lead exposure. In measuring nerve conduction velocity, differences in skin temperature must be taken into account.

24918 (CFS/OO–46-13/35-1991E, pp. 97-111) **Effects of acid rain on forest vegetation: Morphological and nonmensurational growth effects.** Percy, K.E. (Canadian Forestry Service, Fredericton, NB (Canada)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Acid rain is widely perceived to be a threat to forest resources in eastern Canada. The majority of rainfall events in this area have a pH of 4.0-4.5 with most of the more acidic events occurring during the active growing season. Although field injury has yet to be documented, experimental evidence with seedling-stage plants suggests that direct damage to forest tree species can be induced under controlled conditions using simulated rainfall techniques. Seed germination can be inhibited, but usually only at extreme rainfall acidities. Inhibition is generally more severe in deciduous species than in coniferous. In contrast, seedling growth and development can be affected by near-ambient rainfall pH. Observed morphological effects include reductions in the rates of needle and secondary meristem initiation, and in shoot apex size. Growth effects include decreased height and reductions in hypocytyl, cotyledon and needle elongation. Leaf wettability and rainwater penetration rate through the cuticle may be altered as a result of chemical or physical modifications to leaf surface structure by acidic solutions. Macroscopic lead injury has not been detected at simulated pH above 3.4. Little is yet known about cellular or sub-cellular effects. Preliminary species-sensitivity data are available, but interspecific variation in seedling response is large, and further work is required before extrapolation to the field situation can be made. 56 refs., 4 tabs.

24919 (CFS/OO–46-13/35-1991E, pp. 121-130) **Photosynthesis of woody plants: The impact of acidic pollutants, oxidants, and heavy metals.** Jensen, K.F. (United States Dept. of Agriculture, Forest Service, Delaware, OH (United States)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Air pollutants reduce the photosynthetic rate of both deciduous and conifer trees. The reduction varies with the pollutant, the dose, and the plant species. Sulfur dioxide and ozone can cause significant reduction in photosynthesis before visible injury can be observed. The reductions are usually only measurable during the fumigation treatments or immediately afterwards because the photosynthetic rate usually returns to the prefumigation level within 24 hours, if no injury is present. The mechanism or mode of action by which pollutants reduce photosynthesis is still not completely understood. It appears to involve one or more of the following: modification of stomata activity; degradation of chlorophyll; disruption of cell membranes and chloroplast; or inhibition of enzyme activity. 50 refs.

24920 (CFS/OO–46-13/35-1991E, pp. 153-169) **Sensitivity of forest plant reproduction to acid rain.** Cox, R.M. (Toronto Univ., ON (Canada)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

The relevance of long range transported air pollutants to, and their effects on, reproductive processes of forest and native flora are reviewed and discussed. Included are some effects of ozone and sulfur dioxide as they relate to acid deposition or to combined effects with acidic deposition. In vitro and in vivo experiments that investigate the effects on pollen of acidic and trace element components of polluted rain are described. The in vitro pollen sensitivity to pH was related to canopy strata and plant taxon together with, in one instance, the soil type of the population from which it was collected. Most pollen assayed revealed that its threshold of response to pH is exceeded by the pH recorded for daily rain samples collected at one rural site in southern Ontario. The in vitro effects on pollen of cadmium and aluminum in combination with pH are discussed in relation to cation stimulation of pollen and to synergistic interaction with pH, respectively. In vivo inhibition of pollen function by field simulations of acid rain on Oenothera parviflora is compared to similar inhibition by SO_2 fumigations, which have reduced seed set in some species. Given some evidence for correlations between tolerances of the pollen and their sporophytes, the possible effects of direct environmental selection of pollen genotypes on the stigmatic surface by air pollution are discussed with reference to fitness for future generations. 48 refs., 4 figs., 5 tabs.

24921 (CFS/OO–46-13/35-1991E, pp. 112-120) **Physiological and biochemical effects of acid deposition on forest vegetation.** Treshaw, M. (Utah Univ., Salt Lake City, UT (United States)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Despite many mechanisms by which acid deposition might directly damage plants biochemically, none has been documented. Strong acids would ionize to form anions and protons. The hydrogen ions briefly accumulating would first render the cell wall region very acidic. This in turn may alter the calcium balance and cause a loosening reaction of the cell wall fibers leading to water imbalance. Any buildup of anions might promote osmotic imbalance. Subsequent reactions of hydrogen ions with membranes are possible, and a significant increase in leaching of potassium, magnesium and calcium ions has been reported following foliage sprays with artificially acidified rain. Although several important plant processes, including potassium balance, carboxylation, ribosome activity, DNA depression and protein synthesis, are thought

to be influenced by hydrogen balance, hydrogen ions may not penetrate the cell sufficiently to affect these processes. The potential effects are more likely a surface phenomena. Cytoplasmic pH values range from ca 7.0 to 8.5 and may be controlled by regulation of the number of carboxyl groups. The buffering capacity of the cell is limited to coping only with short-term fluctuations. The biochemical effects of acid deposition depend on the balance of internal processes producing and consuming H^+ ions. Equilibrium can be maintained only so long as the H^+ ions produced can be neutralized. Should H^+ concentration exceed a certain threshold of tolerance, physiological injury may be expected. The threshold may be related to the capacity of cells to actively exclude H^+ and generally appears to be below pH 3.0 to 4.0. 36 refs., 1 tab.

24922 (CFS/OO–46-13/35-1991E, pp. 466-473) **Resistance of the caribou lichen (Cladina stellaris (Opiz.) Brodo) to growth reduction by simulated acid rain.** Lechowicz, M.J. (McGill Univ., Montreal, PQ (Canada)). Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

Natural mats of C. stellaris growing in the subarctic lichen woodlands of northern Quebec were treated in a randomized complete block design with solutions of simulated rain at pH 2.5, 3.0, 3.5, 4.0, 4.5, 5.0 and 5.6. These solutions were acidified by addition of mixtures of sulfuric and nitric acids to give both 2:1 and 6:1 microequivalent ratios of SO_4^{2-}:NO_3. Treatments were applied weekly during the snow-free season. Measurements of the mean annual growth rate before and after two years of treatment were used to assess the potential effects of acid precipitation on net production of this important caribou forage lichen. Analysis of covariance showed no significant effect of either pH or SO_4:NO_3 ratio on the growth of C. stellaris. This circum-boreal and very abundant lichen appears to be resistant to at least short-term exposures to acid precipitation. 25 refs., 2 figs., 2 tabs.

24923 (CFS/OO–46-13/35-1991E, pp. 597-600) **Does ozone disturb water balance in forest trees in Sweden?.** Skarby, L. (Swedish Environmental Research Inst., Gotheburg (Sweden)); Berglind, B. Canadian Forestry Service, Ottawa, ON (Canada). 1991. (CONF-8306311–: Effects of acid rain on forest resources, Sainte-Foy (Canada), 14-17 Jun 1983; MICROLOG–92-03656). In *Effects of acid rain on forest resources: Proceedings.* 667p. Source: PC Forestry Canada, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 1G5; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1 PC PRICES UPON REQUEST; MF $10 CAN.

A study was carried out to determine whether ozone affects the stomatal mechanism in conifers in such a way that the transpiration rate is disturbed. This could affect the ability of the tree to maintain its water balance, especially during a drought period. Scots pine (Pinus sylvestris L.) seedlings were exposed for six weeks to simulated ozone levels and episodes (80-240 $\mu g/m^3$) typical of those occurring on the Swedish west coast every summer. Afterwards, seedlings were subjected to water stress. Photosynthesis and transpiration were measured periodically. It was found that photosynthesis rate was not affected. The ozone levels and transpiration rates of both control and exposed seedlings during the entire experimental period are presented. Accumulated water loss during the six week period was 110 g/g (dry weight) in the exposed seedling and 100 g/g in the control. 2 refs., 2 figs.

24924 (CIEMAT–704) **ARIES: Further description of its assessment process.** Rabago, I.; Sierra, I.; Vidania, R. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). 1993. 37p. (In Spanish). Order Number DE93796620. Source: OSTI; NTIS.

ARIES is an integrated system designed in order to facilitate the effects assessment produced by accidental release of toxic chemicals. ARIES has been developed for inhalation exposures to estimate short term consequences over the exposed population. ARIES works with mathematical algorithms and is complemented with an additional system that executes the selection of relevant information, giving and additional support to the assessment. ARIES Methodology is based, on one side, in the development of a system of mathematical models joint sequentially in order to obtain a quick answer about the severity of the expected human effects as a function of the toxic concentration released to the environment (Quantitative process), and on the other side in the analysis and optimisation of the contrasted existing information about chemicals toxicity (Qualitative process). Both processes are sequential and complementary. ARIES methodology is physically supported by an informatic system. ARIES works with relational databases and mathematical algorithms programmed in dbase/sql language which let relate the above process, and furthermore add or incorporate progressively new models or complementary information. It has been developed a first prototype PC's of ARIES including several products of 82/505/EEC Directive. In a previous report we described the systems as a whole, and specially, their qualitative step. This report is directed to describe the quantitative assessment process of the system, specifically those aspects included in the present version of the prototype. Developed parts of quantitative steps are designed for situations in which only basic data like TLV's, DL, etc., are available for the assessment.

24925 (CONF-9308105–1) **Evaluation of possible biological effects from exposure to gaseous SF_6 breakdown products.** Griffin, G.D.; Sauers, I.; James, D.R. Oak Ridge National Lab., TN (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Tennessee Valley Authority, Knoxville, TN (United States); Empire State Electric Energy Research Corp., New York, NY (United States); Nationa DOE Contract AC05-84OR21400. From 8. international symposium on high voltage engineering; Yokohama (Japan); 23-27 Aug 1993. Order Number DE93013210. Source: OSTI; NTIS; INIS; GPO Dep.

A variety of chemical byproducts including SOF_2, SO_2F_2, SF_4, HF, SO_2, etc. are produced at varying concentrations by electrical arcs, sparks or corona discharge in SF_6; most of the byproducts are toxic to some degree. Using a cell culture system, we have studied the toxicity of individual byproduct gases, as well as electrically decomposed SF_6. The toxic potency of various byproducts can be compared, using this cellular assay. The animal toxicological data for these gases, although sparse, is also reviewed. The rationale for selection of various byproduct gases as monitors for evaluating the hazard potential of decomposed SF_6 is discussed.

24926 (DOE/ER/60572–T2) **Effects of pesticides on crab cheliped regeneration: Final report.** Costlow, J.D. Jr. Duke Univ., Durham, NC (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-87ER60572. Order Number DE93015089. Source: OSTI; NTIS; GPO Dep.

The mud crab cheliped regeneration bioassay has proven to be a sensitive and reliable bioassay in studies of the potential sublethal effects of pesticides, including teratogenesis, spontaneous autotomy, and duration of the various stages of development. The assay has also been demonstated to be a useful indication of mortality associated with the impact of these chemicals of anthropogenic origin during the megalopal and early postlarval stages of development. Four pesticides were tested here using the cheliped regeneration bioassay technique. Although carbofuran is approximately 5–6 times more toxic than methomyl, both compounds yield very similar results in terms of sublethal effects.

24927 (DOE/ER/60964–4) **New fluorescence methodology for detecting DNA adducts: Progress report, May 1, 1991–May 21, 1993.** Giese, R.W. Northeastern Univ., Boston, MA (United States). 21 May 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER60964. Order Number DE93015097. Source: OSTI; NTIS; GPO Dep.

A new reagent, BO-IMI, has been developed that achieves, single step, phosphate specific fluorescence labeling under aqueous conditions. Both 3 in. and 5 in. mononucleotides, including representative DNA adducts can be labeled. Included in this technique is a convenient procedure for postlabeling sample cleanup, leading to a practical detection of the products by capillary electrophoresis with laser fluorescencedetection. We consider that this new method will have a significant impact on the measurement of DNA adducts

in human samples. This work was largely accomplished in the second half of our project. In the first half, we set up a new way to isolate DNA nucleotides from blood, worked with an initial, less specific technique for labeling DNA adducts, compared ionizing radiation vs oxidative damage to fluorescein labeled deoxyadenylic acid, and set up a capillary electrophoresis laser fluorescence detection system.

24928 (ETDE/ES-mf–93796610) **Metallothionein as a biological indicator in rats exposed to inorganic mercury.** Morcillo Alonso, M.A. Universidad Autonoma de Madrid (Spain). 1992. 137p. (In Spanish). Order Number DE93796610. Source: OSTI; NTIS.

Groups of Sprague-Dawley rats were exposed to 0,1; 1, 10 and 100 pmm of mercury (as mercuric chloride) in the drinking water for 8 weeks and then were injected intraperitoneally with $^{203}HgCl_2$ three hours prior to sacrifice. Kidney and liver were removed, homogenized and centrifugated at 105.000 g. The supernatant obtained was applied to a Sephadex G-75 column and the ^{203}Hg content in each fraction was determined by gamma-spectrometry. The fractions with Ve/Vo=1,6-2,1 were used for quantitative analysis of the metallothionein (indirect determination via SH-groups) and metals content (Cu, Zn and Hg; atomic absorbance spectrophotometry). The dietary mercury induces an significant increase in renal MT of rats exposed to 10 and 100 ppm. In contrast, no induction of MT was observed in the liver of mercury-exposed rats, neither an increase in urinary excreted MT. Renal MT appears to play a role in the binding of mercury when this is present at low concentrations whereas the hepatic MT does not bind a significant amount of this element at these levels of exposure. There was a strong positive correlation between mercury and copper levels associated to renal MT. The metal composition of MT was: Cu_4,Zn_2;-MT (control group); Cu_5,Zn_3,-MT (group exposed to 0,1 ppm); Cu_6,Zn_6,Hg_1-MT (group exposed to 1 ppm); Cu_8,Zn_4,Hg_3-MT (group exposed to 10 ppm) and Cu_10,Zn_1,Hg_4-MT (group exposed to 100 ppm). (author). 148 refs., 32 figs.

24929 (ETDE-mf–93795280) **Bayreuth Institute of Terrestrial Ecosystem Research (BITOEK). Interim report 1991.** Bayreuther Inst. fuer Terrestrische Oekosystemforschung (BITOEK), Bayreuth (Germany). [1992]. 236p. (In German). Contract OEF 2029;BMFT 0339476A. Order Number DE93795280. Source: OSTI; NTIS (US Sales Only).

This annual interim report of 'BITOeK' deals with topical results of research at the institute in the four subject areas 'cycles of substances', 'substance degradation', 'ecology of population', and 'turnover of substances in plants'. A focus is on soil chemistry and biology and the changes they undergo because of environmental pollution. In particular, the interest of the research groups centres on the nitrogen budget of soil, plants (spruces), and the entire ecosystem (deposition, discharge, turnover), the water and ion budget of forest soils, the activity of soil microorganisms under the influence of different environmental chemicals, and the consequences of soil acidification. (UWA).

24930 (LA–12346-MS) **Preliminary toxicology study of 3,6-diamino-1,2,4,5-tetrazine.** London, J.E. Los Alamos National Lab., NM (United States). Mar 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93009117. Source: OSTI; NTIS; GPO Dep.

The calculated acute oral LD 30/50 (lethal dose for 50% of the animals occurring within 30 days after compound administration) value for 3,6-diamino-1,2,4,5-tetrazine (DATZ) was 863 mg/kg in rats. According to classical guidelines, DATZ would be considered slightly to moderately toxic for rats. The calculated acute oral $LD_{30/50}$ value was 2,288 mg/kg in mice and would be considered slightly to moderately toxic for mice. Skin application studies using rabbits demonstrated DATZ to be a nonirritant. The eye study using rabbits disclosed DATZ to be a very mild irritant. The sensitization study using guinea pigs did not show DATZ to have potential sensitizing properties.

24931 (ORNL/FTR–4230) **Participation in the European research conference on effects of elevated CO_2 levels, air pollutants and climate change on natural plant ecosystems: Foreign trip report, March 30–April 13, 1992.** Norby, R.J. Oak Ridge National Lab., TN (United States). 23 Apr 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011291. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended the European Research Conference, presented a poster, and participated in the roundtable discussion. The conference was the first in what is to be a series of meetings every two years on the effects of elevated CO_2 and air pollutants on tree physiology. The presentations at the conference showed the increasing level of interest in CO_2 effects within the European research community. The conference provided a useful forum for discussing how the research programs can be directed toward the most fruitful d important areas.

24932 (ORNL/FTR–4300) **Travel to Luso, Portugal, to participate in a NATO Advanced Study Institute workshop on the use of biomarkers in assessing health and environmental impacts of chemical pollutants: Foreign trip report, May 29, 1992–June 10, 1992.** Travis, C.C. Oak Ridge National Lab., TN (United States). 24 Jun 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011076. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended and directed a NATO Advanced Study Institute Workshop on the Use of Biomarkers in Assessing Health and Environmental Impacts of Chemical Pollutants. The objective of the workshop was to develop a conceptual framework for the use of biomarkers in the assessment of human and environmental health, to review the current state of knowledge of biomarkers, and to formulate the research needs for implementation and interpretation of biological monitoring programs to define community health problems.

24933 (PNL–8650-Pt.1) **SNODOG Glossary: Part 1, Introduction.** Watson, C.R. Pacific Northwest Lab., Richland, WA (United States). 15 Apr 1993. 93p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93013502. Source: OSTI; NTIS; GPO Dep.

The SNODOG Glossary is used by the DOE-supported life-span beagle studies to describe medical observations in a standardized format. It is an adaptation of the human medical glossary, SNOMED, which lists 107,165 terms. Each of the five laboratories, Argonne National Laboratory, the Inhalation Toxicology Research Institute, the Pacific Northwest Laboratory, the University of California at Davis, and the University of Utah, has selected an appropriate subset from the published SNOMED glossary and added beagle and research-specific terms. The National Radiobiology Archives is the coordinator of these enhancements, and periodically distributes SNODOG to the respective laboratories. Information donated by Colorado State University and Oak Ridge National Laboratory has been related to SNODOG and is available in a standardized format. This document is designed for the database manager and the scientist who will be managing or coding medical observations. It is also designed for the scientist analyzing coded information. The document includes: an overview of the NRA and the SNODOG glossary, a discussion of hardware requirements, a review of the SNODOG code structure and printed lists of the 4,770 terms which have been used at least once. Instructions for obtaining electronic copies of the glossary and for nominating additional terms are provided. This document describes the origins and structure of the SNODOG codes, explains code usage at each participating institution, and presents a usage frequency tabulation of the terms for neoplasia. A diskette or magnetic tape containing 15,641 SNODOG codes and translations is available on request.

24934 (ANL/EAIS/CP–79014) **Geographic Information System (GIS) applications in emergency management.** Newsom, D.E.; Mitrani, J.E. Argonne National Lab., IL (United States). Environmental Assessment and Information Sciences Div. [1993]. 2p. Sponsored by USDOE, Washington, DC (United States); Federal Emergency Management Agency, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930372–8: 1993 international simulators conference on high performance computing, Arlington, VA (United States), 29 Mar - 1 apr 1993). Order Number DE93009984. Source: OSTI; NTIS; GPO Dep.

One of the most useful and readily available technologies to aid emergency managers is the geographic information system (GIS). The potential usefulness of GIS is indicated by many of the papers presented in this conference. This paper will discuss two of the authors' experiences with a GIS in combination with simulation models, and will present an overview of other GIS applications.

24935 (ANL/ESH/CP–78903) **Emergency exercise methodology.** Klimczak, C.A. Argonne National Lab., IL (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9303113–1: Hazmat central conference, Chicago, IL (United States), 9-11 Mar 1993). Order Number DE93009132. Source: OSTI; NTIS; GPO Dep.

Competence for proper response to hazardous materials emergencies is enhanced and effectively measured by exercises which test plans and procedures and validate training. Emergency exercises are most effective when realistic criteria is used and a sequence of events is followed. The scenario is developed from pre-determined exercise objectives based on hazard analyses, actual plans and procedures. The scenario should address findings from previous exercises and actual emergencies. Exercise rules establish the extent of play and address contingencies during the exercise. All exercise personnel are assigned roles as players, controllers or evaluators. These participants should receive specialized training in advance. A methodology for writing an emergency exercise plan will be detailed.

24936 (BNL–48481) **Assessment of needs and requirements for a geographic information system for Brookhaven National Laboratory.** Baxter, S.L.; Daum, M.L.; Scott, A. Brookhaven National Lab., Upton, NY (United States). 19 Nov 1992. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93009260. Source: OSTI; NTIS; GPO Dep.

At the request of the Brookhaven National Laboratory Office of Environmental Restoration, and with the cooperation of the Safety and Environmental Protection and Plant Engineering Divisions, a Geographic Information System (GIS) Task Group has undertaken an effort to identify the data requirements, potential applications, and computing environment within which an integrated GIS could be implemented to meet the environmental and facilities management needs of the Laboratory. The Task Group held discussions with the three participating groups and with Laboratory officials. Software and hardware vendors were invited to demonstrate their products to all participants using BNL data, and private consultants discussed their GIS and database applications. After considering the needs of the three groups and other general implementation concerns, a list of ten requirements for a BNL site-wide GIS has been determined. On the basis of these considerations, three conceptual models for an integrated GIS are defined. These include a highly centralized system, a fully distributed system, and a composite model. The models differ in their allocation of responsibility for data management, applications development and GIS analysis, and local user support. Several issues remain to be resolved before an integrated GIS for the three operational groups can be fully implemented.

24937 (CONF-921275–, pp. 17-18) **Reactivity of sodium azide.** Sakumoto, K. (Kyushu Institute of Technology, Kitakyushu (Japan). Faculty of Engineering); Hara, Y.; Nakamura, H.; Ochi, K. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

This paper studies reactivity of sodium azide used as gas generating main agent for automobile air bags, rockets, and lifesaving equipment. Powder sodium azide causes an exothermic reaction under 460°C controlled atmosphere with a sharp decline in weight. Pelleted sodium azide causes the same reaction around 400°C, which means that forming sodium azide powder into pellets accelerates the reaction. Under Ar, N, air, and He atmosphere normal pressure, a peak of exothermic temperature moves to a higher temperature side as the gas increases in thermal conductivity. It moves to a lower temperature side when pressurized. As milling time increases, a peak temperature of the differential thermal analysis decreases. There is no deterioration with age in inert nitrogen gas, but a decrease in purity by 5-8% is seen in oxygen and CO2. Under the CO2 plus steam atmosphere, purity reduces to 47% 48 hours later because of formation of sodium hydrogen carbonate. Any other gases except nitrogen reduce their decomposition initiation temperatures. 4 figs.

24938 (CONF-921275–, pp. 19-22) **Reactivity of activated carbon which adsorbed exhaust gas from the semiconductor production process.** Fukunaga, A. (Ebara Research Co. Ltd., Kanagawa (Japan)); Ito, H.; Mori, Y.; Matsumura, C.; Iida, M.; Tanaka, K.; Kondo, S. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

The paper studies reactivity of activated carbon which adsorbs exhaust gas from the semiconductor production process in which gas including F, N, and O is made plasmatic for treatment. Plasma gas adsorption carbon adsorbs NO2, FNO, FNO2 and F2, and causes self-reaction and generates heat even at a temperature of several tens°C. The gas attains a considerably high temperature by itself, depending on the amount of adsorption. Mainly NO2 relates to this reaction. When the temperature is raised up to 400°C, the gas reacts abruptly and this reaction seems to be caused by F2 absorbed in graphite layers of activated carbon. In case of contacting it with materials easily oxidized such as alcohol, the activated carbon reacts and generates heat at a normal temperature. Accordingly, such exhaust gas adsorbing activated carbon starts to react from relatively low temperatures depending on the situation, and is in danger of causing a rapid pressure increase. There is no danger in chlorine-base and bromine-base gases. 1 ref., 4 figs., 1 tab.

24939 (CONF-921275–, pp. 33-34) **Danger identifying power.: Difference between aged and young persons.** Sato, Y. (Tokyo University of Mercantile Marine, Tokyo (Japan)); Usui, S. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

Labor shortage and worker's age advancing have become a problem in work sites. Accordingly, an experiment was carried out on how aged persons can identify a danger. Four danger prediction training sheets were used for a danger identifying test. For example, the sheet No. 1 depicts four workers trying to lift a propane gas bomb to a second floor by pulling up a belt passed through holes on a lid of the bomb. The subjects included aged male persons as old as from 61 to 76 years of age, female persons from 57 to 72 years old, and young persons from 21 to 23 years old. They were directed to view the sheets and describe as many accident scenarios as possible in ten minutes. Then, accident finding check lists previously prepared were distributed, and the subjects were requested to write statements again. The aged female subjects showed a remarkable effect from the check lists, with the final number of accident finding exceeding considerably that of the male subjects. The number in the young persons exceeded that in the aged persons in all the cases by about 50%. A considerable fall in the identifying power was recognized in the aged persons. 1 fig., 1 tab.

24940 (CONF-921275–, pp. 35-38) **Safety analyzing method with emphasis on operants (objects of work).: Especially when applied to repair work and material handling work.** Takahashi, T. 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In

Proceedings of the 25th Safety Engineering Study Meeting. Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

This paper introduces a safety analyzing method called a (4 + 3)×3 analysis. Conventional work systems have identified works as comprising persons, materials, and works, wherein machines and environment were the main objects for the materials. Conceptions on causes in disaster cause analysis can be classified largely into machines, environments, and objects (materials and commodities), from which one item has been selected as a most important item. However, safety anticipation requires recognition of coexistence of elements and an analysis placing emphasis on operants (objects receiving works). The (4 + 3)×3 analysis extracts safety check points on contact points from various combinations of three functions represented by the four elements comprising people, machines, objects, and environment, the energy, the information, and the approach and contact of three elements (people, machines, and objects) at beginning and end of a work and during a process flow. The analysis uses these check points as a clue to determining problems. The system covers not only people, machines, and materials (objects) independently, but also all the combinations such as people with machines, machine with materials, and materials with environment. 3 figs., 1 tab.

24941 (CONF-921275–, pp. 39-42) **Probability of occurrence of industrial disasters.: Its changes and future prediction.** Hasegawa, K. (Fire Research Institute, Tokyo (Japan)). 2 Dec 1992. 160p. (In Japanese). From 25. safety engineering study meeting; Kitakyushu (Japan); 2-3 Dec 1992. In *Proceedings of the 25th Safety Engineering Study Meeting.* Order Number DE93793904. Source: OSTI; NTIS (US Sales Only).

This paper presents data for occurrence of labor disasters in Japan for the past 40 years, and illustrates a trend that both of frequencies and intensities of the disasters of every kind and in each industry decrease year by year. For example, the disaster occurrence frequency for the whole industry has decreased to 1/20 in 37 years. The future frequency was predicted by extending the regression line obtained from these data. Bases for the prediction to be possible include that the prediction values and their reliability zones can be calculated under a reliability (95%), the prediction is very little affected from extraordinary past events in the national economy (including the oil crises), and safety technologies will continue developing, as one of the future factors. The frequency of labor disasters in the whole industry in 1952, 1989, and 2000 has reduced and will reduce from 43.6→ 1.81→ 0.772, and the intensity from 4.59→ 0.179→0.076. 4 refs., 6 figs., 2 tabs.

24942 (EGG-M–92571) **Accrediting industrial safety training programs.** Beitel, L. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-921187–5: 16. training resources and data exchange: managing for performance and results, Seattle, WA (United States), 2-4 Nov 1992). Order Number DE93013669. Source: OSTI; NTIS; INIS; GPO Dep.

There are job-specific training requirements established by regulations that Impose stringent training requirements on a contractor, for example, the Occupational Safety & Health Act (OSHA). Failure to comply with OSHA training requirements can result in severe penalties being levied against a company. Although an accredited training program is expensive, it is a possible solution for minimizing risks associated with job-specific training requirements for employees. Operating DOE contractors direct approximately 10 percent of the operating funds toward training activities. Training needs for contractors span a broad range, from requirements awareness training for managers, to general training required on a one-time basis for all employees, to highly specialized training programs for employees involved In clean-up operations at hazardous waste sites. With this kind of an investment in training, it is logical to maximize the most return on an investment of training funds and to limit exposure to liability suits whenever possible. This presentation will provide an overview of accredited industrial safety programs. The criteria for accredited industrial safety programs will be defined. The question of whether accredited training programs are necessary will be examined. Finally, advantages and disadvantages will be identified for accrediting industrial safety training programs.

24943 (ORNL/FTR–4545) **[Travel to France to participate in the 10th workshop of the scientific group on methodologies for the safety evaluation of chemicals]: Foreign trip report, March 5–15, 1993.** Barnthouse, L.W. Oak Ridge National Lab., TN (United States). 31 Mar 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011821. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report summarizes a trip by L. W. Barnthouse of the Environmental Sciences Division (ESD), Oak Ridge National Laboratory (ORNL), to Montpellier, France, where he participated in the 10th Workshop of the Scientific Group on Methodologies for the Safety Evaluation of Chemicals. The topic of this workshop was Effects of Chemicals on Ecosystems. Dr. Barnthouse wrote a discussion paper on ecological risk assessment and participated in a discussion/writing group on assessment of regional-level effects of chemicals.

24944 **False color viewing device.** Kronberg, J.W. To Dept. of Energy. 8 May 1991. USA patent application 7-697,158. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93012003. Source: OSTI; NTIS; GPO Dep.

This invention consists of a viewing device for observing objects in near-infrared false-color comprising a pair of goggles with one or more filters in the apertures, and pads that engage the face for blocking stray light from the sides so that all light reaching, the user's eyes come through the filters. The filters attenuate most visible light and pass near-infrared (having wavelengths longer than approximately 700 nm) and a small amount of blue-green and blue-violet (having wavelengths in the 500 to 520 nm and shorter than 435 nm, respectively). The goggles are useful for looking at vegetation to identify different species and for determining the health of the vegetation, and to detect some forms of camouflage.

24945 (PNL–8574) **Evaluation of S-101 course "Supervisors' Orientation to Occupational Safety in DOE" taught in Las Vegas, Nevada, October 26–29, 1992.** Wright, T.S. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93010359. Source: OSTI; NTIS; GPO Dep.

This report summarizes trainee evaluations for the Safety Training Section course, "Supervisors' Orientation to Occupational Safety in DOE", (S-101) which was conducted October 26–29, 1992 at EG&G Measurement, in Las Vegas, Nevada. Sections 1.1 and 1.2 of this report summarize the quantitative course evaluations that trainees provided upon completion of the course. Sections 2.0 and 3.0 provide examination results, and recommendations for improvement. Appendix A provides a transcript of the trainees' written comments and Appendix B presents a copy of the course evaluation form that students were asked to complete.

24946 (PNL-SA–21968) **Occupational injury and illness recordkeeping.** Pacific Northwest Lab., Richland, WA (United States). [1993]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93013454. Source: OSTI; NTIS; INIS; GPO Dep.

This manual was prepared to accompany a course to train managers in proper recordkeeping procedures as required by DOE Orders and OSHA guidelines.

24947 (UCRL-ID–112719) **The impact of horizontal resolution on moist processes in the ECMWF model.** Phillips, T.J.; Corsetti, L.C.; Grotch, S.L. Lawrence Livermore National Lab., CA (United States). Jan 1993. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (PCMDI–8). Order Number DE93011718. Source: OSTI; NTIS; GPO Dep.

Summer and winter climates simulated at spectral scales T21, T42, T63 and T106 with the ECMWF model are analyzed to determine the impact of changes in horizontal resolution on atmospheric water vapor, clouds, convection, and precipitation. Qualitative

changes in Pi many moist processes occur in the transition from spectral T21 to T42, especially in the tropics where atmospheric convection plays a central role. However, the seasonal climate simulations do not show evidence of convergence to an asymptotic climate state at high resolution. Global convective precipitation increases monotonically with resolution, but frontal precipitation, precipitable water, and cloud cover display a qualitatively different pattern; after undergoing abrupt reductions in the transition from T21 to T42, their global averages show relative increases at finer resolutions. Precipitable water and cloud cover also display a seasonal asymmetry in their responses to increasing resolution.The comparative insensitivity of global cloud cover to resolution is mainly a consequence of compensating tendencies of clouds in different regions. With increasing resolution, decreases in lowlatitude clouds that result from drying of the tropical atmosphere are partially offset by increases in high-latitude clouds associated with enhanced relative humidity in response to an intensifying extratropical cold bias. The large-scale tropical moist processes are modeled more realistically at T21 than in the finer-resolution simulations, wherein anomalous seasonal climatic features such as a double ITCZ and underdeveloped summer monsoon circulation are evident. Although some of these anomalies might ameliorate if the physical parameterizations were suitably "tuned," these deficiencies may reflect more fundamental problems related to a mismatch between the resolution of the model and the implicit spatial and temporal scales of the parameterizations.

(CONF-9304109–1: SAGEEP '93: symposium on the application of geophysics to environmental and engineering problems, San Diego, CA (United States), 18-21 Apr 1993). Order Number DE93009989. Source: OSTI; NTIS; INIS; GPO Dep.

Aberdeen Proving Ground (APG), in the state of Maryland (Figure 1), is currently managing a comprehensive Installation Restoration Program involving more than 360 solid-waste managing units contained within 13 study areas. The Edgewood area and two landfills in the Aberdeen area appear on the National Priority List under the Comprehensive Environmental Response, Compensation, and Liability Act. Therefore, APG has entered into an interagency agreement with the US Environmental Protection Agency to address the listed areas. The West Branch of the Canal Creek area (Figure 1), located within the Edgewood area, is one of the areas that requires a Source Definition Study because there is an ongoing release of volatile organic compounds into the creek. A report prepared by EAI Corporation (1989) included a list of 29 potentially contaminated buildings in the Edgewood area. Sixteen of the buildings contain known contaminants, nine buildings contain unknown contaminants, and four of the buildings are potentially clean. The EAI report recommended that a sampling and monitoring program be established to verify contamination levels in and around each building. Thirteen of the potentially contaminated buildings are in the West Branch of the Canal Creek area and are potential sources of volatile organic compounds. Operations have ceased and the buildings have been abandoned, but processing equipment, sumps, drains, ventilation systems, and underground storage tanks remain. These appurtenances may contain liquid, solid, or vapor contaminants of unknown nature.

24949 (ANL/MCS-TM–171) **A toolkit for building earth system models.** Foster, I. Argonne National Lab., IL (United States). Mathematics and Computer Science Div. Mar 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93012147. Source: OSTI; NTIS; GPO Dep.

An earth system model is a computer code designed to simulate the interrelated processes that determine the earth's weather and climate, such as atmospheric circulation, atmospheric physics, atmospheric chemistry, oceanic circulation, and biosphere. I propose a toolkit that would support a modular, or object-oriented, approach to the implementation of such models.

(Indiana Univ., Bloomington, IN (United States)); Pratt, L.M.; Knoll, A.H. Indiana Univ., Bloomington, IN (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER13978. Order Number DE93015093. Source: OSTI; NTIS; GPO Dep.

The older assemblages stand in contrast with the ca. 1000 Ma old Hunting Formation, Arctic Canada, which contains what may be the oldest evidence for modern algae - red algal fossils that compare closely with members of the extant family Bangiophyceae (Butterfield et al., 1990). Taken together the Nonesuch, Shaler, Hunting and other assemblages support the hypothesis of a major episode of eukaryotic diversification ca. 1000 Ma ago. Prior to this time, eukaryotic primary producers must have been physiologically primitive (and now extinct) algae whose abundance in ecosystems is poorly constrained by analogies with the present oceans. Cyanobacteria were major primary producers in a wide range of marine environments. After 1000 Ma, diversifying red green and chromophyte algae contributed significantly to primary production in all save microbial mat communities in restricted environments. It bears mention that such mat communities remained significant potential sources of buried organic matter until the end of the Proterozoic, necessitating exploration strategies that differ from those commonly employed for younger rocks (Knoll, in press). As in Phanerozoic basins, petroleum exploration in Proterozoic rocks requires tools for stratigraphic correlation. In Neoproterozoic (<1000 Ma) rocks, biostratigraphy is possible, and it is aided significantly by C and Sr isotopic chemostratigraphy. New data from the Shaler Group contribute to the construction of C and Sr isotopic curves for Neoproterozoic time, making possible much improved chronostratigraphy for this time interval. (Asmerom et al., 1991; Hayes et al., ms. in preparation).

24951 (DOE/FTR–93011425) **Travel to Bermuda to attend meetings of the JOIDES Panel Chairs Committee and the JOIDES Planning Committee for discussion of the Ocean Drilling Program: Foreign trip report, November 30–December 5, 1992.** Lysne, P. Sandia National Labs., Albuquerque, NM (United States). 21 Dec 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93011425. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The Ocean Drilling Program is an international consortium instituted to explore the sub-sea portion of the earth's crust. Support comes from the US National Science Foundation (about 60%) and from member nations. Work within the Ocean Drilling Program parallels that in land-based programs such as the DOE-supported US Continental Scientific Drilling Program and the German Knontinentale Tiefbohrprogramm (KTB). All scientific drilling programs are suffering from a lack of monies directed toward drilling and logging technology, and this situation is exacerbated by the decline in research within the world-wide drilling and logging industries. Cooperative efforts between scientific programs are a possible way to move forward, but these efforts are hampered by lack of an appropriate infrastructure. The organizational model presented by the ODP functions well in its role to promulgate scientific efforts, and it may serve as a model for inter-program thrusts that involve large monetary expenditures, legal responsibilities, and intellectual property rights. A set of specific action items is put forth to explore the envelope presented by the ODP infrastructure. Many of these

items are founded in, and are in direct support of efforts that are under active consideration by the US Continental Scientific Drilling Program.

24952 (ETDE/JP-mf–93794512, pp. 182-187) **Petrophysics and elastic wave technology for evaluation of rock properties.: Development of data analysis technique (impedance and interval velocity inversion).** Ogita, S. (Japan National Oil Corp., Tokyo (Japan)); Shimizu, N.; Matsuoka, T. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

The Technology Development Center of Japan National Oil Corporation is studying methods to derive underground impedance structures with high accuracy as a sub-theme of the development program for property analyzing seismic exploration technology that began in 1989. This paper is a 1991 annual report for the study. Algorithms was developed by the end of the previous fiscal year to infer underground impedance distribution from seismic records after assemblage and migration using the generalized linear inversion (GLI) method. In the present fiscal year, these algorithms were used to perform case studies in Mexico Bay and the Kanazawa area in Hokkaido, Japan, to extract problems and improve the program. For instance, the model base inversion was reprocessed, and a result was obtained that is more stable than that obtained in the last year, and geologically consistent. The program was further improved in use convenience aspect, from which a dialogue-type seismic inversion system was developed. 3 figs.

(Japan National Oil Corp., Tokyo (Japan)); Takahashi, A. Japan National Oil Corp., Tokyo (Japan). 30 Oct 1992. 537p. (In Japanese). In *Record of TRC's activities in the fiscal year 1991.* Order Number DE93794512. Source: OSTI; NTIS (US Sales Only).

This paper is a 1991 annual report on a research which was launched in 1990 as one of the research items in the special research project 'development of property analyzing geophysical exploration methods' at the Technology Development Center of Japan National Oil Corporation. The research aims at making a reflection seismic exploration using S-waves possible by utilizing the fact that P-waves can convert to S-waves at ocean bottom even in a sea water area in which no S-waves can propagate through fluids. Preparing an assemblage cross section chart for wave motions has difficulties in separating wave motions in P-waves and PSSP-waves (P-waves reconverted after having propagated through ground and reflected), and analyzing velocity in the PSSP-waves. As a result of the numerical experiment performed in the fiscal 1991, it was found out that the wave motions can be separated and observed especially clearly in the slowness-time domain. In addition, an indoor experiment using a synthetic resin model provided findings on detection of different converted waves. Further, considerations were given on the NMO correction method using marine seismic exploration data that have been obtained previously in an experiment conducted on the sea off Soma. 3 figs.

24954 (JAB–10733-TM6) **Processed seismic motion records from Little Skull Mountain, Nevada earthquake of June 29, 1992, recorded at stations in southern Nevada.** Lum, P.K.; Honda, K.K. URS/John A. Blume and Associates, Engineers, San Francisco, CA (United States). [1992]. 206p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-89NV10733. Order Number DE93005849. Source: OSTI; NTIS; GPO Dep.

For complete package including technical report and 8mm data file, Order No. DE93013314.

As part of the contract with the US Department of Energy, Nevada Field Office (DOE/NV), URS/John A. Blume & Associates, Engineers (URS/Blume) maintains a network of seismographs in southern Nevada to monitor the ground motion generated by the underground nuclear explosions (UNEs) at the Nevada Test Site (NTS). The seismographs are located in the communities surrounding the NTS and the Las Vegas valley. When these seismographs are not used for monitoring the UNE generated motions, a limited number of seismographs are maintained for monitoring motion generated by other than UNEs (e.g. motion generated by earthquakes, wind, blast). During the subject earthquake of June 29, 1992, a total of 20 of these systems recorded the earthquake motions. This report contains the recorded data.

24955 (LA–12534-C) **Proceedings of the first geological materials constitutive modeling workshop.** Swift, R.P.; Snell, C.M. (eds.). Los Alamos National Lab., NM (United States). Apr 1993. 303p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-921265–: 1. geological materials constitutive modeling workshop, Los Alamos, NM (United States), 9-10 Dec 1992). Order Number DE93009161. Source: OSTI; NTIS; GPO Dep.

A workshop on constitutive modeling of geologic materials was held at Los Alamos National Laboratory on 9–10 December, 1992. The workshop was hosted by the Earth and Envirorunental Sciences Division and the Physics Division at the Laboratory. Its purpose was to provide an overview of our current understanding of the dynamic response of geologic materials under saws wave loading, to identify the most important gaps in this understanding, and to define promising experimental approaches for filling the gaps. Particular emphasis was placed on material behavior in the hydrodynamic and strength-dominated regimes for buried explosions, with applications to verification and nonproliferation. These proceedings are a compilation of the brief summary papers and associated view graphs presented at the workshop, along with commentary on modeling and experimental issues addressed in the roundtable discussion session. The papers are printed as submitted by the authors, but have been retyped for format uniformity. In cases where legibility allowed, the view graphs were reduced to half-page size for a more compact document.

24956 (LA-UR–93-856) **Theory of nonlinear elastic behavior in rock.** McCall, K.R. Los Alamos National Lab., NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9306129–1: 13. international symposium on nonlinear acoustics, Bergen (Norway), 28 Jun - 2 jul 1993). Order Number DE93010713. Source: OSTI; NTIS; GPO Dep.

We study plane wave propagation in an isotropic, homogeneous solid with cubic and quartic anharmonicity. Attenuation is introduced through use of a retarded displacement response. We develop a Green function technique to exhibit the solution for the displacement field as a systematic hierarchy in the nonlinear parameters. This solution is applied to three problems: propagation from monochromatic and broadband sources, and the shape of nonlinear stress curves.

24957 (LA-UR–93-1069) **New Mexico Geochronology Research Laboratory: Zuni-Bandera volcanic field road log.** Laughlin, A.W.; Charles, R.; Reid, K.; White, C. Los Alamos National Lab., NM (United States). [1993]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9304107–1: 1993 quaternary dating field conference, Grants, NM (United States), 27-28 Apr 1993). Order Number DE93010739. Source: OSTI; NTIS; GPO Dep.

This field conference was designed to assemble a group of Quaternary researchers to examine the possibility of using the Zuni-Bandera volcanic field in western New Mexico as a test area for evaluating and calibrating various Quaternary dating techniques. The Zuni-Bandera volcanic-field is comprised of a large number of basaltic lava flows ranging in age from about 700 to 3 ka. Older basalts are present in the Mount Taylor volcanic field to the north. Geologic mapping has been completed for a large portion of the Zuni-Bandera volcanic field and a number of geochronological investigations have been initiated in the area. While amending this conference, please consider how you might bring your expertise and capabilities to bear on solving the many problem in Quaternary geochronology.

24958 (PNL–8539) **Selected hydraulic test analysis techniques for constant-rate discharge tests.** Spane, F.A. Jr. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 80p. Sponsored by USDOE, Washington, DC (United States). DOE

Contract AC06-76RL01830. Order Number DE93012240. Source: OSTI; NTIS; INIS; GPO Dep.

The constant-rate discharge test is the principal field method used in hydrogeologic investigations for characterizing the hydraulic properties of aquifers. To implement this test, the aquifer is stressed by withdrawing ground water from a well, by using a downhole pump. Discharge during the withdrawal period is regulated and maintained at a constant rate. Water-level response within the well is monitored during the active pumping phase (i.e., drawdown) and during the subsequent recovery phase following termination of pumping. The analysis of drawdown and recovery response within the stress well (and any monitored, nearby observation wells) provides a means for estimating the hydraulic properties of the tested aquifer, as well as discerning formational and nonformational flow conditions (e.g., wellbore storage, wellbore damage, presence of boundaries, etc.). Standard analytical methods that are used for constant-rate pumping tests include both log-log type-curve matching and semi-log straight-line methods. This report presents a current "state of the art" review of selected transient analysis procedures for constant-rate discharge tests. Specific topics examined include: analytical methods for constant-rate discharge tests conducted within confined and unconfined aquifers; effects of various nonideal formation factors (e.g., anisotropy, hydrologic boundaries) and well construction conditions (e.g., partial penetration, wellbore storage) on constant-rate test response; and the use of pressure derivatives in diagnostic analysis for the identification of specific formation, well construction, and boundary conditions.

24959 (SAND–92-1185) **A neural network approach to seismic phase identification.** Draelos, T.J. Sandia National Labs., Albuquerque, NM (United States). Mar 1993. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013601. Source: OSTI; NTIS; GPO Dep.

An automatic phase identification system that employs a neural network approach to classifying seismic event phases is described. Extraction of feature vectors used to distinguish the different classes is explained, and the design and training of the neural networks in the system are detailed. Criteria used to evaluate the performance of the neural network approach are provided.

24960 (UCRL-ID–111963) **Application to selected sites of the DG-1015 methodology to determine probabilistic controlling earthquakes.** Bernreuter, D.L. Lawrence Livermore National Lab., CA (United States). Jul 1992. 82p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93009442. Source: OSTI; NTIS; INIS; GPO Dep.

The NRC requested that LLNL form a group of experts to assist them in the revision of Appendix A to CFR 100. The members of the Expert Group for the revision of Appendix A are listed in Table 1. For the remainder of the report this Expert Group will be simply referred to as the EG. A number of meetings were held with the EG. At the meeting with the EG and NRC, held in Rockville, Maryland, in October 1991, one issue that received considerable discussion was how to best use the probabilistic seismic hazard analysis. Here considerable disagreement developed. Some EG members preferred using a purely probabilistic approach. Others wanted to use a deterministic and probabilistic approach. At the EG meeting in October, Dr. Cornell suggested that in addition to a purely probabilistic approach that there was in the literature an alternative approach that used the probabilistic seismic hazard analysis to determine a hazard-consistent scenario earthquake(s) or a controlling earthquake(s) from the probabilistic analysis (CEPA). The EG agreed that this was a useful concept to explore. NRC requested that LLNL explore this concept and apply it to four test sites given in Table 2. Four other sites were added because EPRI had performed an analysis similar to some of the analyses described in this report thus allowing some comparisons between LLNL and EPRI results. In this brief report, we describe the alternatives and key choices that have to be made. We also provide justification for the tentative choices made that are incorporated into the proposed Appendix B to 10 CFR 100, and Draft Regulatory Guide DG-1015 being sent out for public comment. Further studies are underway to better understand the influence of the choices made and to confirm that the path taken is the best path or to determine if modifications are required.

24961 (UCRL-JC–107852-Rev.1) **Ocean acoustic processing: A model-based approach.** Candy, J.V. (Lawrence Livermore National Lab., CA (United States)); Sullivan, E.J. Lawrence Livermore National Lab., CA (United States); Naval Underwater Systems Center, Newport, RI (United States). Jul 1992. 8p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. Contract N00014-91-F-0114. (CONF-921066–3-Rev.1: Oceans '92, Newport, RI (United States), 26-29 Oct 1992). Order Number DE93011902. Source: OSTI; NTIS; GPO Dep.

A model-based approach is proposed to solve the ocean acoustic signal processing problem that is based on a state-space representation of the normal-mode propagation model. This model is generalized to the stochastic case where an approximate Gauss-Markov model evolves which allows the inclusion of stochastic phenomena such as noise and modeling errors in a consistent manner. Based on this framework, investigations are made of model-based solutions to the signal enhancement, and related parameter estimation problems.

24962 (UCRL-JC–111977-Rev.1) **A zeroth order statistical model for fracture in rock in compression: Revision 1.** Blair, S.C. (Lawrence Livermore National Lab., CA (United States)); Daveler, S.; Cook, N.G.W. Lawrence Livermore National Lab., CA (United States). 23 Mar 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930644–5-Rev.1: 34. US symposium on rock mechanics, Madison, WI (United States), 27-30 Jun 1993). Order Number DE93011899. Source: OSTI; NTIS; GPO Dep.

Rocks are known to fracture in compression via the formation, extension and coalescence of extensile cracks. These cracks are generally oriented in the direction of the maximum principal stress and as more cracks are formed or existing cracks grow, crack interaction becomes very important. The formation and extension of these cracks under conditions of compression is attributed to local tensions at the microscale that may be caused by heterogeneity in the shape, orientation and strength of grains and other factors [1]. Moreover, fracture mechanics analysis shows that the stress intensity factor for cracks under tensile stress is proportional to the stress difference (σ_1-σ_2) at the site [2]. In addition, it is known that the local stress and strain fields in a rock are dependent on the loading path for the rock. That is, when a crack forms and opens, strain energy is stored in the rock that is not recovered upon unloading [3]. We have developed a model for fracture of rock in compression that incorporates these and other aspects of rock behavior. Our model utilizes afield theory approach to the analysis of microcracking at the grain scale. This approach incorporates the concept of superposition and the techniques of boundary element analysis [4] and percolation theory [5] to form a simple yet powerful method for the study of progressive fracture of rock and other disordered materials. We have simulated triaxial laboratory compression tests using the model and produced strain hardening behavior and patterns of cracking similar to that observed in rocks tested in compression. This technical note describes the detail of the model formulation and presents results for a simulated triaxial test.

24963 (UCRL-JC–111981) **Pore pressure buildup coefficient in synthetic and natural sandstones.** Berge, P.A. (Lawrence Livermore National Lab., CA (United States)); Bonner, B.P.; Wang, H.F. Lawrence Livermore National Lab., CA (United States). Feb 1993. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ;FG02-91ER14194. (CONF-930644–9: 34. US symposium on rock mechanics, Madison, WI (United States), 27-30 Jun 1993). Order Number DE93011890. Source: OSTI; NTIS; GPO Dep.

We present laboratory measurements of Skempton's pore pressure buildup coefficient B for synthetic and natural sandstones, and use our results to estimate the unjacketed pore compressibility 1/Kϕ. Measured values of B are always near unity for differential pressures below ~2 MPa, regardless of porosity, grain composition, or the presence of small amounts of clay in the samples. We observed B near 0.7–0.8 for differential pressures of about 8–21

MPa in a clay-free synthetic sandstone. Similar values are expected for natural sandstones with low crack densities, whereas sandstones containing greater concentrations of microcracks apparently have values of B near 0.6. Our results suggest that the pore compressibility may have values close to the pore-fluid compressibility rather than the grain compressibility.

24964 (UCRL-JC–112052) **Inverting ultrasonic data on solid/fluid mixtures for Biot-Gassmann parameters.** Berryman, J.G. (Lawrence Livermore National Lab., CA (United States)); Lumley, D.E. Lawrence Livermore National Lab., CA (United States). Feb 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9306142–1: 2. international conference on mathematical and numerical aspects of wave propagation (SIAM), Newark, DE (United States), 7-10 Jun 1993). Order Number DE93011952. Source: OSTI; NTIS; GPO Dep.

Although the Biot-Gassmann equations axe known to predict acoustic data for water-saturated glass bead packings very well, these equations often seem to give anomalous results for naturally occurring rocks. The theory shows that, as the compressibility of the pore fluid increases, the inverse of the coefficients C and M in Blot's equations should increase linearly, and the theory also gives definite predictions about the values of the slope and intercept of the resulting lines. Although the anticipated linear behavior is observed in real data, the values of the slopes axe smaller than expected for some rocks. Therefore, the process of inverting this data for the desired coefficients must incorporate other physical constraints and then produces, not a single value but rather, a range of possible values for each coefficient.

24965 (UCRL-JC–112366) **AMIP: Diagnostic subproject on the variability in the tropics: Synoptic to intraseasonal time scales.** Sperber, K.R. (Lawrence Livermore National Lab., CA (United States)); Slingo, J.M.; Matthews, A.; Palmer, T.N. Lawrence Livermore National Lab., CA (United States). Dec 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9210334–1: 17. annual climate diagnostics conference, Norman, OK (United States), 19-23 Oct 1992). Order Number DE93009287. Source: OSTI; NTIS; GPO Dep.

The aim of this subproject is to evaluate the ability of GCMs to simulate the transient component of tropical convection and to increase our understanding of the possible processes that govern the development, propagation and dissipation of synoptic disturbances and the intraseasonal oscillation. A pilot study of the tropical variability in a high resolution version of the ECMWF model has already shown that a GCM may have considerable skill in simulating the observed distribution and periodicities of tropical disturbances (Slingo et al. 1993). Verification of the model results will involve satellite data and NWP analyses. In particular, a similar study of the observed intraseasonal oscillation using EC analyses, being carried out as part of the Joint Diagnostics Project at Reading University (Hoskins et al. 1989), will form an important part of the verification of this subproject. In this paper we present a preliminary evaluation of the intraseasonal oscillation as simulated by the ECMWF model. This simulation, with a horizontal resolution of T42 (approximately 2.8°), was performed at Lawrence Livermore National Laboratory on behalf of the European Centre for Medium-Range Weather Forecasts.

Exactly solvable models of the three-particle scattering problem in the adiabatic approach are developed on the basis of algebraic generalized Bargmann - Darboux trandformations. Supersymmetric treatment of gauge adiabatic models in the three-body problem. Analytic solutions are constructed for a slow subsystem of equations. 22 refs.

24973 (UCRL-JC–110006) **RCS modeling with the TSAR FDTD code.** Pennock, S.T.; Ray, S.L. Lawrence Livermore National Lab., CA (United States). Mar 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920750–7: Institute of Electrical and Electronic

Engineers Antennas and Propagation Society (IEEE-APS) international symposium, Chicago, IL (United States), 18-25 Jul 1992. Order Number DE93012481. Source: OSTI; NTIS; GPO Dep.

The TSAR electromagnetic modeling system consists of a family of related codes that have been designed to work together to provide users with a practical way to set up, run, and interpret the results from complex 3-D finite-difference time-domain (FDTD) electromagnetic simulations. The software has been in development at the Lawrence Livermore National Laboratory (LLNL) and at other sites since 1987. Active internal use of the codes began in 1988 with limited external distribution and use beginning in 1991. TSAR was originally developed to analyze high-power microwave and EMP coupling problems. However, the general-purpose nature of the tools has enabled us to use the codes to solve a broader class of electromagnetic applications and has motivated the addition of new features. In particular a family of near-to-far field transformation routines have been added to the codes, enabling TSAR to be used for radar-cross section and antenna analysis problems.

24974 (CONF-9207203–, pp. 66) **Beam of electrons for emission control.** Maezawa, A. (Ebara Corp., Tokyo (Japan)). 22 Jul 1992. 320p. (In Japanese). From 1. meeting of The Japan Institute of Energy and the 70th Foundation anniversary meeting; Tokyo (Japan); 22-24 Jul 1992. In *Proceedings of the 1st Meeting of the Japan Institute of Energy and the 70th Foundation Anniversary Meeting.* Order Number DE93793523. Source: OSTI; NTIS (US Sales Only).

The keynote speech was introduced about the emission control system by beam of electrons. That system is a dry type simultaneous desulfurization/denitrification system which was developed cooperatively with the Japan Atomic Energy Research Institute. Because of dry type, that system does not produce exhaust water and consequently, it does not need large scale exhaust water treatment facilities. The desulfurization/denitrification ratio by that system is higher than that by the conventional system. The system structure is simple as the desulfurization and denitrification proceed both simultaneously. The existing exhaust gas production source is easily connectable as the reaction temperature is not required to be high. Waste is not produced as the by-products (ammonium sulfate and its mixture) can be recycled as fertilizer. That system is applicable into a range where both SOx and NOx concentrations extend from several ppM to several thousands of ppM Explanation was also made of actual examples and results of applying that system to exhaust gas from the iron ore sintering furnace, exhaust gas by the coal combustion and exhaust dilute gas from the diesel.

24975 (DOE/FTR–93013411) **[Travel to Kiev, Ukraine to present a paper describing work done at Fermilab on the development of advanced cryogenic insulation systems at the International Cryogenic Engineering Conference (ICEC-14)]: Foreign trip report, June 5–13, 1992.** Boroski, W.N. Fermi National Accelerator Lab., Batavia, IL (United States). 16 Jul 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE93013411. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The paper was well received at the conference; particularly interested were CERN researchers who were making similar measurements on cryogenic insulations for the proposed Large Hadron Collider project. Notes are presented on the attendees, most of whom were Russians, Ukrainians, and Europeans. Papers were presented across the entire spectrum of cryogenics: heat and fluid transfer, high temperature superconductors, and cryocoolers, large cryogenic systems, etc. The Ukrainian Academy of Sciences is doing a great deal of work in cryogenics. Some personal conversations about Chernobyl are reported briefly.

24976 (INDC(NDS)–213/GM3, pp. 47) **Appendix 1.** Soloviev, S. (Radievyj Inst., Leningrad (Russian Federation)). International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Oct 1988. (CONF-8809159–: 14. world conference of the International Nuclear Target Development Society (INTDS): heavy-ion targets and related phenomena, Darmstadt (Germany), 5-9 Sep 1988). In *The influence of target and sample properties on nuclear data measurements: Summary report of the IAEA advisory group meeting in co-operation with the International Nuclear Target Development Society (INTDS), held in Darmstadt, Germany, 5-9 September 1988.* [74p.] Order Number DE93626092. Source: OSTI; NTIS (US Sales Only); INIS.

In the Khlopin Radium Institute targets containing fissile nuclides from U up to Cf are prepared, including those: with active layer areal density up to 10 mg/cm^2 (U), 3 mg/cm^2 (Th), 1 mg/cm^2 (Np, Pu); on the backings support from Al_2O_3; with low number of nuclei (up to 10^{13}); with inhomogeneity of active layer of about ≈1%. The following semiconductor detectors with non-planar shape are produced: $2\pi\alpha$ (for calibration purposes low activity target with a diameter up to 24mm); Cylindrical (outer diameter 5mm); Canal (diameter of canal 5-8 mm). Semiconductor detectors with fissile layer on the sensitive surface: The conditions of target and detector production should be agreed with the Institute management. (author). Abstract only.

24977 (INDC(NDS)–213/GM3, pp. 51) **Appendix 5.** Heagney, J.M. (MICROMATTER Co., Deer Harbor, WA (United States)). International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Oct 1988. (CONF-8809159–: 14. world conference of the International Nuclear Target Development Society (INTDS): heavy-ion targets and related phenomena, Darmstadt (Germany), 5-9 Sep 1988). In *The influence of target and sample properties on nuclear data measurements: Summary report of the IAEA advisory group meeting in co-operation with the International Nuclear Target Development Society (INTDS), held in Darmstadt, Germany, 5-9 September 1988.* [74p.] Order Number DE93626092. Source: OSTI; NTIS (US Sales Only); INIS.

MICROMATTER offers the experimenter a wide range of foil and target fabrication capabilities. Our capabilities include pressing, rolling, and vacuum evaporation of both natural and isotopically enriched materials. We also perform some reductions of isotopic materials used in these samples. We prefer to mount foils on customer provided frames and ship ready for use in our returnable vacuum shipping container, except for thicker gauge foils which may be shipped self-supporting. (For detailed information request our Foil Products and Accelerator Target Service Information.) We also offer carbon foils on glass slides in the thickness range from 3 to 50 μgm/cm^2. (Request Carbon Foil Information.) For X-ray fluorescence we offer 63 elements as thin, single-element calibration standards on a wide variety of backing and mounts. (Request X-ray Fluorescence Standards Information.). (author). Abstract only.

24978 (INDC(NDS)–213/GM3, pp. 70) **Problems of tritium targets.** Seeliger, D. (Technische Univ. Dresden (Germany)). International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Oct 1988. (CONF-8809159–: 14. world conference of the International Nuclear Target Development Society (INTDS): heavy-ion targets and related phenomena, Darmstadt (Germany), 5-9 Sep 1988). In *The influence of target and sample properties on nuclear data measurements: Summary report of the IAEA advisory group meeting in co-operation with the International Nuclear Target Development Society (INTDS), held in Darmstadt, Germany, 5-9 September 1988.* [74p.] Order Number DE93626092. Source: OSTI; NTIS (US Sales Only); INIS.

Solid state tritium targets are widely used for 14 MeV neutron production of DT-neutron generators. Usually they are produced by evaporation of a titanium and zirconium layer on a thin copper backing, with a subsequent absorption of tritium gas in it. The literature of solid state tritium targets during irradiation with ion beam is limited by the heating of the target connected with a higher diffusion rate of tritium out of the titanium layer, the formation of thin carbon layers at the surface and also ion sputtering processes. It depends also on the composition of ion beam striking the targets (admixture of molecular a.o. components). The use of tritium targets implies the necessity of radiation protection measures due to the radioactivity of tritium. The present status of this aspect is discussed in the paper presented including some recommendations concerning the most efficient use of solid state tritium targets. (author). Abstract only.

24979 (INDC(NDS)–213/GM3, pp. 70-71) **Tritium solid targets for intense D-T neutron production and its related problems.** Sumita, Kenji (Osaka Univ., Suita (Japan). Faculty of Engineering). International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Oct 1988. (CONF-8809159–: 14. world conference of the International Nuclear Target Development Society (INTDS): heavy-ion targets and related phenomena, Darmstadt (Germany), 5-9 Sep 1988). In *The influence of target and sample properties on nuclear data measurements: Summary report of the IAEA advisory group meeting in co-operation with the International Nuclear Target Development Society (INTDS), held in Darmstadt, Germany, 5-9 September 1988.* [74p.] Order Number DE93626092. Source: OSTI; NTIS (US Sales Only); INIS.

This review paper is divided into three parts. Firstly, to attain an intense neutron production rate, the construction of a design with a higher tritium-containing surface and an effective cooling system like a rotating target device are discussed. The maximum attainable intensity based on tritium solid targets shall be estimated regarding planning for future D-T sources. Secondly, on the way to carry out some experiments, an absolute intensity calibration and an angular dependent neutron energy spectrum of the neutron source are essential parameters to analyse the results of the experiments. Sometimes the space dependent neutron spectrum is required as well as the space dependent neutron flux near the targets and irradiation samples. The measurement methods and their examples are reviewed for tritium solid targets. The third part is devoted to discuss the protection to tritium contamination problems due to unavoidable release of tritium gas from targets. Performance and effectiveness of tritium collection systems for intense D-T neutron sources shall be discussed in some examples. Tritium contamination incidents due to the faulted film powder of target surface are also reported in some real incident cases. (author). Abstract only.

24980 (INDC(NDS)–213/GM3, pp. 73) **Use of Rutherford Backscattering to determine uranium deposit uniformity.** Wasson, O.A. (National Inst. of Standards and Technology, Gaithersburg, MD (United States)); Schrack, R.A. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Oct 1988. (CONF-8809159–: 14. world conference of the International Nuclear Target Development Society (INTDS): heavy-ion targets and related phenomena, Darmstadt (Germany), 5-9 Sep 1988). In *The influence of target and sample properties on nuclear data measurements: Summary report of the IAEA advisory group meeting in co-operation with the International Nuclear Target Development Society (INTDS), held in Darmstadt, Germany, 5-9 September 1988.* [74p.] Order Number DE93626092. Source: OSTI; NTIS (US Sales Only); INIS.

A Rutherford Backscattering (RBS) facility has been established at the 3-MV positive-ion accelerator at the National Bureau of Standards. This facility has been used to study the areal density distribution of uranium deposits used in neutron cross section measurements. A versatile scattering chamber with numerous ports, five-axis goniometer, target ladder, and solid state detector is in operation. Beams of 1 MeV He^+ ions and 5 MeV He^{++} ions are available. The variation in areal density of a 75 cm diameter UO_2 deposit was measured using a 1 MeV He^+ beam. The results are in excellent agreement with those obtained from alpha-particle activity measurements. However, the RBS measurements provide better definition of the uniformity near the edge of the deposits. Our experience in the use of these two methods to characterize the areal densities of deposits for cross section measurements will be presented. (author). Abstract only.

24981 (IS-M–746) **Gas atomized Er_3Ni powder for cryocooler applications.** Anderson, I.E.; Osborne, M.G.; Takeya, H.; Gschneidner, K.A. Jr. Ames Lab., IA (United States). [1992]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. (CONF-921130–2: 7. international cryocooler conference, Santa Fe, NM (United States), 15-19 Nov 1992). Order Number DE93011564. Source: OSTI; NTIS; INIS; GPO Dep.

A high pressure gas atomization (HPGA) approach was developed to produce uniform spherical powders of high purity Er_3Ni and 3 batches of about 1.3 kg each were prepared. Average yield of high qualityspherical powders between 0.15 and 0.35mm was about 16% of the initial atomizer charge weight. Microstructural analysis of sectioned powder samples revealed single phase particles with some internal cracking but no evidence of an oxidized surface shell. Chemical analysis and x-ray diffraction measurements verified that single phase particles of the stoichiometric composition had been generated. Vacuum fusion measurements indicated that the powder contained 2600ppM oxygen. The heat capacity of a hot pressed, partially sintered Er_3Ni powder sample was measured from 2 to 80K; results indicated a maximum heat capacity of0.43 J/cm^3K at 7K and the peak appears to be about 0.04 J/cm^3K higher and narrower than reported by Sahashi. The Sahashi heat capacity peak has two maxima, suggesting the two phases in their material. Our Er_3Ni powder has a larger heat capacity than Pb over the entire range of temperatures up to about 25K which should permit a lower final temperature for a cryocooler stage composed of this material

24982 (LA-UR–93-1420) **The superfluid Stirling refrigerator, a new method for cooling below 0.5 K.** Brisson, J.G.; Kotsubo, V.; Swift, G.W. Los Alamos National Lab., NM (United States). 9 Apr 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930801–1: Conference of the International Union of Pure and Applied Physics on low temperature physics (LT 20), Eugene, OR (United States), 1-11 Aug 1993). Order Number DE93012672. Source: OSTI; NTIS; INIS; GPO Dep.

A new subkelvin refrigerator, the superfluid Stirling cycle refrigerator, uses a working fluid of ^3He-^4He mixture in a Stirling cycle. The thermodynamically active components of the mixture are the ^3He, which behaves like a Boltzman gas, and the phonon-roton gas in the ^4He. The superfluid component of the liquid is inert. Two refrigerators have been built and temperatures of 340 mK have been achieved.

24983 (SAND–92-2221C) **Compound-lens injector for a 19-MeV, 700-kA electron beam.** Sanford, T.W.L. (Sandia National Labs., Albuquerque, NM (United States)); Poukey, J.W.; Halbleib, J.A.; Mock, R.C. Sandia National Labs., Albuquerque, NM (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930511–3: International particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE93013752. Source: OSTI; NTIS; INIS; GPO Dep.

A robust injector capable of controlling the radius and angle of incidence of the intense, pulsed, annular electron beam extracted from the HERMES-III accelerator is described. The injector, called the compound lens, uses a tapered anode to control the beam electrostatically, followed by a gas cell with externally applied current to control the beam magnetically. Adjustment of the anode-cathode gap and external current of the injector permits the mean radius and injection angle of the beam to be defined independently of one another. Measurements of these quantities confirm model expectations. The extended planar-anode diode with a thin anode window has been used to inject a 25-ns, 19-MeV, 700-kA, annular electron beam into gas-filled drift cells for beam transport to bremsstrahlung targets located downstream of the HERMES-III accelerator. By adjusting the anode-cathode (AK) gap of the diode, the radius and angle of incidence of the annular beam at injection can be varied. Here the authors theoretically model and experimentally characterize the electron flow in the compound-lens diode when it is used as a bremsstrahlung source. Results are presented as the AK gap is increased to 40 cm. The model combines the MAGIC code to simulate the time-dependent electron flow in the AK gap and lens with the CYLTRAN code of the ITS system to model window effects and the subsequent transport in the target.

This paper describes significant progress made in the study of magnetic field reconnection and plasma processes in the magnetosphere in the past three years. A total of 43 research and review papers have been completed under the DOE support. In this paper, some of the most important results obtained in the past three-years are described.

24985 (DOE/ER/13726–6) **Fundamentals and techniques of nonimaging optics.** Winston, R. Chicago Univ., IL (United States). Enrico Fermi Inst. Apr 1993. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER13726. Order Number DE93013145. Source: OSTI; NTIS; GPO Dep.

For many tasks in illumination and collection the acceptance angle is required to vary along the reflector. If the acceptance angle function is known, then the reflector profile can be calculated as a functional of it. The total flux seen by an observer from a source and its brightness (radiance) is proportional to the sum of the view factor of the source and its reflection. This allows one to calculate the acceptance angle function necessary to produce a certain flux distribution and thereby construct the reflector profile. We demonstrate the method for several examples, including finite size sources with reflectors directly joining the source.

24986 (DOE/ER/13740–10) **[Investigation of transitions from order to chaos in dynamical systems].** Stevens Inst. of Tech., Hoboken, NJ (United States). [1992]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER13740. Order Number DE93014437. Source: OSTI; NTIS; INIS; GPO Dep.

This report briefly discusses the following topics on chaotic systems; numerical investigations of fast dynamo problem for stationary space-periodic flows with chaotic streamlines; analytical and numerical investigations of magnetic field generation by conducting flows with finite resistivity; and emittance growth in charged particle beams.

24987 (DOE/FTR–93012817) **Travel to Institut d'Astronomie et d'Astrophysique to teach and to pursue research in various problems in nuclear astrophysics: Foreign trip report, 1 January–1 September 1992.** Howard, W.M. Lawrence Livermore National Lab., CA (United States). 1 Oct 1992. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93012817. During the period 1 January, 1992 to 1 September, 1992, I was on Professional Research and Teaching Leave (PRTL) at the Insitut d'Astronomie et d'Astrophysique at the Universite Libre de Bruxelles, Brussels, Belgium. The purpose of the PRTL was to pursue research in various problems in nuclear astrophysics in collaboration with my European colleagues. As part of my PRTL I visited several research institutes and attended several meetings. These included visits to the University of Mainz, the Institute fur Kernphysik, Kernforschungszentrum, in Karlsruhe, Germany, the Max Planck Institute for Astrophysics in Garching Germany and the Torino Observatory in Torino, Italy. I also attended the meeting Nuclei in the Cosmos II in Karlsruhe, Germany and the 55th Annual Meteoritical Society Meeting in Copenhagen, Denmark. My research at the Insitut d'Astronomie et d'Astrophysique concentrated on several areas, including: (1) the anomalous heavy element compositions of SiC grains, (2) the p-process nucleosynthesis in Type Ia supernovae, (3) astudy of the neutron-rich α-rich freeze out and subsequent r-process that is thought to occur in Type II supernovae and (4) the influence of opacities on the helium shell instabilities in AGB stars. The work on the SiC grain compositions resulted in contributions to two conferences and a paper submitted to Meteoritics. The work on the astrophysical p-process resulted in a contribution to Nuclei in the Cosmos IIin Karhsruhe, as did the work on the astrophysical r-process. Continuation of all of this research is planned for the future. Below is a very brief summary of this work.

24988 (FNAL/C–92/313-A) **Inflation after COBE: Lectures on inflationary cosmology.** Turner, M.S. (Chicago Univ., IL (United States). Enrico Fermi Inst.). Fermi National Accelerator Lab., Batavia, IL (United States). [1992]. 70p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract AC02-76CH03000. Grant: NAGW-2381. (CONF-9206314–2: TASI summer school; Cargese summer school on quantitative particle physics; Varenna summer school on galaxy formation, Boulder, CO (United States); Corsica (France); Varenna (Italy), 11-29 Jun 1992; jul 1992; jul 1992; CONF-9207199–1; C Order Number DE93014008. Source: OSTI; NTIS; INIS; GPO Dep.

In these lectures I review the standard hot big-bang cosmology, emphasizing its successes, its shortcomings, and its major challenge-a detailed understanding of the formation of structure in the Universe. I then discuss the motivations for and the fundamentals of inflationary cosmology, particularly emphasizing the quantum origin of metric (density and gravity-wave) perturbations. Inflation addresses the shortcomings of the standard cosmology and provides the "initial data" for structure formation. I conclude by addressing the implications of inflation for structure formation, evaluating the various cold dark matter models in the light of the recent detection of temperature anisotropies in the cosmic background radiation by COBE. In the near term, the study of structure formation offers a powerful probe of inflation, as well as specific inflationary models.

24989 (FNAL/Pub–93/057-A) **Sterile neutrinos as dark matter.** Dodelson, S. (Fermi National Accelerator Lab., Batavia, IL (United States)); Widrow, L.M. Fermi National Accelerator Lab., Batavia, IL (United States); Toronto Univ., ON (Canada). Canadian Inst. for Theoretical Astrophysics. Mar 1993. 11p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract AC02-76CH03000. Grant NAGW-2381. Order Number DE93012533. Source: OSTI; NTIS; INIS; GPO Dep.

The simplest model that can accommodate a viable nonbaryonic dark matter candidate is the standard electroweak theory with the addition of right-handed or sterile neutrinos. This model has been studied extensively in the context of the hot dark matter scenario. We reexamine this model and find that hot, warm, and cold dark matter are all possibilities. We focus on the case where sterile neutrinos are the dark matter. Since their only direct coupling is to left-handed or active neutrinos, the most efficient production mechanism is via neutrino oscillations. If the production rate is always less than the expansion rate, then these neutrinos will never be in thermal equilibrium. However, they may still play a significant role in the dynamics of the Universe and possibly provide the missing mass necessary for closure. We consider a single generation of neutrino fields (ν_L, ν_R) with a Dirac mass, μ, and a Majorana mass for the right-handed components only, M. For $M \gg \mu$ we show that the number density of sterile neutrinos is proportional to μ^2/M so that the energy density today is independent of M. However M is crucial in determining the large scale structure of the Universe. In particular, $M \simeq 0.1$–1.0 key leads to warm dark matter and a structure formation scenario that may have some advantages over both the standard hot and cold dark matter scenarios.

24990 (JINR-D–2-91-499) **The electric field of a current-carrying conductor.** Strel'tsov, V.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1991. [4p.] Order Number DE93626637. Source: OSTI; NTIS (US Sales Only); INIS.

A subject concerning the relativistic invariance of the Gauss theorem has been discussed. The appearance of the electric field around the neutral conductor after excitation of current in it doesn't signify the change of its charge. 8 refs.; 1 fig.

24991 (JINR-E–2-92-39) **On the electrical toroidal solenoids.** Afanas'ev, G.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [8p.] Order Number DE93626639. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Phys. Lett., A.

We give explicit construction of electrical toroidal solenoid and discuss its properties. 16 refs.; 3 figs.

24992 (JINR-E–11-92-236) **Iteration scheme for the multiparameter nonlinear boundary value problem with the additional**

conditions and its application to some field models. Amirkhanov, I.V.; Puzynin, I.V.; Strizh, T.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1992. [14p.] Order Number DE93626638. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to the International Workshop 'Polarons and Applications', May 25-31, 1992, Pushchino, Russia.

The iterative scheme based on the combination of Continuous analogue of the Newton's method and Continuation method was developed for the solving a boundary value problem together with an additional condition. The accuracy was investigated numerically. The suggested method was applied for the numerical investigation of the equations of the solvated electron problem, of some bielectron problem and one QCD problem with an increasing potential. 10 refs.; 6 figs.; 2 tabs.

24993 (KFKI–1992-22/B) **Remarks on the Robinson-Trautman solutions.** Hoenselaers, C. (Loughborough Univ. of Technology (United Kingdom). Dept. of Mathematics); Perjes, Z. Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics. Aug 1992. [14p.] Order Number DE93626640. Source: OSTI; NTIS (US Sales Only); INIS.

Robinson-Trautman space-times with a spacelike Killing vector are considered. It is shown that there are special initial values for which the solution does not exist for all future times. In general, however, the solution will asymptotically go over into the C-metric. Perturbations of the C-metric are discussed. The results of numerical calculations are shown. (author) 13 refs.; 5 figs.

24994 (LA-UR–93-1241) **Imaging of magnetospheric dynamics using low energy neutral atom detection.** Funsten, H.O.; McComas, D.J.; Moore, K.R.; Scime, E.E. Los Alamos National Lab., NM (United States). [1993]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9302115–1: AGU monograph/solar system plasma physics meeting on resolution of processes in space and time, Yosemite, CA (United States), Feb 1993). Order Number DE93012656. Source: OSTI; NTIS; GPO Dep.

Recent advances in low energy neutral atom (LENA) detection technology show that magnetospheric imaging is achievable with $4_o \times 4_o$ resolution and can distinguish numerous features of the magnetosphere. A critical factor in detecting low energy neutrals is their removal from the ambient UV background. One technique to accomplish this is by ionizing the neutrals by their transmission through an untrathin charge modification foil and subsequent electrostatic deflection. In this type of instrument, the driving factor for resolution and sensitivity is scattering in the foil and the ionization probability of transiting neutrals. We describe results of a prototype LENA imager using a collimated beam of 10 key H. Additionally, we illustrate model results of anticipated LENA images of the magnetosphere based on the Rice Convection Model and show that plasma variations resulting from geomagnetic storm disturbances can be observed using a LENA imager.

24995 (LA-UR–93-1286) **Solar wind channels for MeV particles.** Page, D.E. (Jet Propulsion Lab., Pasadena, CA (United States)); Goldstein, B.G.; Bame, S.J. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930779–8: International cosmic-ray conference, Calgary (Canada), 19-20 Jul 1993). Order Number DE93012648. Source: OSTI; NTIS; GPO Dep.

Plasma, magnetic field and charged particle data from the Ulysses spacecraft is used to demonstrate that MeV particles follow channels defined by solar wind flow regimes.

24996 (LA-UR–93-1470) **Ion anisotropy driven waves in the earth's magnetosheath and plasma depletion layer.** Denton, R.E. (Dartmouth Coll., Hanover, NH (United States). Dept. of Physics and Astronomy); Hudson, M.K.; Anderson, B.J.; Fuselier, S.A.; Gary, S.P. Los Alamos National Lab., NM (United States). [1993]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9302115–3: AGU monograph/solar system plasma physics meeting on resolution of processes in space and time, Yosemite, CA (United States), Feb 1993). Order Number DE93012751. Source: OSTI; NTIS; GPO Dep.

Recent studies of low frequency waves ($\omega_r \leq \Omega_p$, where Ω_p is the proton gyrofrequency) observed by AMPTE/CCE in the plasma depletion layer and magnetosheath proper arereviewed. These waves are shown to be well identified with ion cyclotron and mirror mode waves. By statistically analyzing the transitions between the magnetopause and time intervals with ion cyclotron and mirror mode waves, it is established that the regions in which ion cyclotron waves occur are between the magnetopause and the regions where the mirror mode is observed. This result is shown to follow from the fact that the wave spectral properties are ordered with respect to the proton parallel beta, $\beta_{||p}$. The later result is predicted by linear Vlasov theory using a simple model for the magnetosheath and plasma depletion layer. Thus, the observed spectral type can be associated with relative distance from the magnetopause. The anisotropy-beta relation, $A_p \equiv (T\perp/T_{||})_p - 1 = 0.50\beta_{||p}{}^{-0.48}$ results from the fact that the waves pitch angle scatter the particles so that the plasma is near marginal stability, and is a fundamental constraint on the plasma.

24997 (LA-UR–93-1605) **Search for UHE emission from Cygnus X-3.** Stark, M.J. The CYGNUS Collaboration. Los Alamos National Lab., NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930779–5: International cosmic-ray conference, Calgary (Canada), 19-20 Jul 1993). Order Number DE93012720. Source: OSTI; NTIS; INIS; GPO Dep.

Data from the CYGNUS experiment has been searched for evidence of ultra high energy (UHE) emission from Cygnus X-3. An upper limit to continuous flux from the source is given. In addition, we find no evidence for episodic emission from Cygnus X-3 on any time scale from 3.3 minutes to 4 years. The results of searches for periodic emission from Cygnus X-3 will be presented at the conference.

24998 (LA-UR–93-1608) **Search for ultra-high energy emission from Geminga and five unidentified EGRET sources.** The CYGNUS Collaboration. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930779–6: International cosmic-ray conference, Calgary (Canada), 19-20 Jul 1993). Order Number DE93012717. Source: OSTI; NTIS; GPO Dep.

Data from the CYGNUS extensive air shower array were searched for continuous ultra-high energy (UHE) gamma radiation from five unidentified EGRET sources and from the Geminga pulsar. No evidence for continuous emission from any of these objects was found. Data in the Geminga source bin were also searched for pulsed emission using the recent EGRET ephemeris (237 ms period). No evidence of a periodic signal was found. The 90% confidence level upper limit on the continuous gamma-ray flux above 80 TeV for Geminga is 7.9×10^{-14} cm^{-2} s^{-1}.

24999 (LA-UR–93-1609) **A new limit on the rate-density of evaporating black holes.** The CYGNUS Collaboration. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930779–9: International cosmic-ray conference, Calgary (Canada), 19-20 Jul 1993). Order Number DE93012716. Source: OSTI; NTIS; INIS; GPO Dep.

Data taken with the CYGNUS detector between 1989 and 1993 have been used to search for 1 second bursts of ultra-high energy (UHE) gamma rays from any point in the northern sky. There is no evidence for such bursts. Therefore the theory-dependent upper limit on the rate-density of evaporating black holes is $6.1 \times 10^5 \mathrm{pc}^{-3}\mathrm{yr}^{-1}$ at the 99% C.L.. After renormalizing previous direct searches to the same theory, this limit is the most restrictive by more than 2 orders of magnitude.

25000 (LBL–33995) **Capillary surfaces in a wedge: Differing contact angles.** Concus, P. (Lawrence Berkeley Lab., CA (United States)); Finn, R. Lawrence Berkeley Lab., CA (United States). Apr 1993. 12p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration,

Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098. Grant: NAG3-1143;Grant: DMS89-02831. (CONF-9305197–1: International symposium on microgravity science and application, Beijing (China), 10-13 May 1993). Order Number DE93013903. Source: OSTI; NTIS; GPO Dep.

The possible zero-gravity equilibrium configurations of capillary surfaces u(x,y) in cylindrical containers whose sections are (wedge) domains with corners are investigated mathematically, for the case in which the contact angles on the two sides of the wedge may differ. In such a situation the behavior can depart in significant qualitative ways from that for which the contact angles on the two sides are the same. Conditions are described under which such qualitative changes must occur. Numerically computed surfaces are depicted to indicate the behavior.

25001 (SLAC-PUB–6057) **Quantized conic sections; quantum gravity.** Noyes, H.P. Stanford Linear Accelerator Center, Menlo Park, CA (United States). 15 Mar 1993. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9302102–1: ANPA WEST 9 conference, Stanford, CA (United States), 13-15 Feb 1993). Order Number DE93010950. Source: OSTI; NTIS; INIS; GPO Dep.

Starting from free relativistic particles whose position and velocity can only be measured to a precision $< \Delta r \Delta v > \equiv \pm$ k/2 meter^{2}sec^{-1} , we use the relativistic conservation laws to define the relative motion of the coordinate $r = r_1 - r_2$ of two particles of mass m_1, m_2 and relative velocity $v = \beta c = {}_{(k_1+k_2)}/{}^{(k_1-k_2)}$ in terms of conic section equation $v^2 = \Gamma\,[2/r \pm 1/a]$ where "+" corresponds to hyperbolic and "−" to elliptical trajectories. Equation is quantized by expressing Kepler's Second Law as conservation of angular niomentum per unit mass in units of k. Principal quantum number is $n \equiv j + \frac{1}{2}$ with"square" ${}_{T^2}/{}^{A^2} = (n-1)nk^2 \equiv \ell_\odot(\ell_\odot + 1)k^2$. Here $\ell_\odot = n - 1$ is the angular momentumquantum number for circular orbits. In a sense, we obtain "spin" from this quantization. Since Γ/ a cannot reach c^2 without predicting either circular or asymptotic velocities equal to the limiting velocity for particulate motion, we can also quantize velocities in terms of the principle quantum number by defining $\beta_n{}^{/2} = {}_{c^2}/{}^{n^2} = {}_{n^2}/1({}_{c^2}\ a/\Gamma\ ) = ({}_{n\Gamma}/1)^2$. For the Z_1 e,Z_2 e of the same sign and $\alpha \equiv e^2/m_e \kappa$ c, we find that $\Gamma/\ c^2\ a = Z_1\ Z_2\alpha$. The characteristic Coulomb parameter $\eta\ (n) \equiv Z_1\ Z_2\alpha/\beta_n = Z_1 Z_2\ nN_\Gamma$ then specifies the penetration factor $C^2(\eta) = 2\pi\eta\ /\ (e^{2\pi\eta} - 1)$. For unlike charges, with η still taken as positive, $C^2(-\eta) = 2\pi\eta/(1 - e^{-2\pi\eta})$.

25002 (UCRL-CR–110994) **Localized wave solutions in optical fiber waveguides.** Besieris, I.M. (Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States). Dept. of Electrical Engineering); Vengsarkar, A.M. Lawrence Livermore National Lab., CA (United States); Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States). Dept. of Electrical Engineering. Aug 1991. 126p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93009214. Source: OSTI; NTIS; GPO Dep.

A novel bidirectional decomposition of exact solutions to the scalar wave equation has been shown to form a natural basis for synthesizing localized wave (LW) solutions that describe localized, slowly decaying transmission of energy in free space. In this work, we demonstrate the existence of LW solutions in optical fiber waveguides operated in the linear regime. In this sense, these solutions are fundamentally different from the non-linear, soliton-based communication systems. Despite the dielectric waveguiding constraints introduced by the fiber, solutions that resemble the fire-space solutions can be obtained with broad bandwidth source spectra As with the fire-space case, these optical waveguide LW solutions propagate over very long distances, undergoing only local variations. Four different source modulation spectra that give rise to solutions similar to Focus Wave Modes (FWM's), splash pulses, the scalar equivalent of Hilhon's spinor modes and the Modified Power Spectrum (MPS) pulses are considered. A detailed study of the MPS pulse is performed, practical issues regarding source spectra are addressed, and distances over which such LW solutions maintain their non-decaying nature are quantified. Present day state-of-the-art technology is not capable of meeting requirements that will make practical implementation of LW solution-based fiber optic systems a reality. We address futuristic technology issues and briefly describe efforts that could lead to efficient LW solution-based fiber optic systems.

25003 (UCRL-ID–113019) **The accuracy of approximating radiative heat transfer using a temperature dependent thermal conductivity.** Creighton, J.R. Lawrence Livermore National Lab., CA (United States). 11 Feb 1993. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93013105. Source: OSTI; NTIS; GPO Dep.

Radiative heat transfer across the gap between two coaxial cylinders can be approximated using an equivalent thermal conductivity that is a cubic polynomial in the temperatures T_1 and T_2 of the two surfaces ($T_1 > T_2$). It is convenient to write the polynomial in terms of the average temperature, yielding $T_{avg}{}^3$ multiplied by an expression in T_{avg}/T_1. This expression has a value close to unity when the temperature difference is small and approaches 2 as the lower temperature approaches zero. The approximation is valid if the temperature of each surface is uniform. Numerical calculations showed that it is also reasonably accurate when the temperature varies with height on the cooler surface. An electrical circuit analogy shows that this should be generally true, but that the approximation may be poor when the hotter surface temperature is not uniform. The appendix shows the derivation of the view factors used in the radiative heat transport calculations.

25004 (UCRL-JC–110081) **Recovery of materials impacted at high velocity.** Nellis, W.J.; Gratz, A.J. Lawrence Livermore National Lab., CA (United States). Dec 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921162–16: Hypervelocity impact symposium, Austin, TX (United States), 17-20 Nov 1992). Order Number DE93014150. Source: OSTI; NTIS; GPO Dep.

Hypervelocity impact can produce unique effects in materials. including crystal structures, microstructures, and properties. Examples include impact-driven shock waves to synthesize novel materials 1 mm and 1 μm thin shocked to pressures up to 100 GPa (1 Mbar), preferential crystallographic alignment achieved by taking into account the shape and size of powder particles, and high-pressure phase transitions quenched in geological materials. Thin specimens are used to achieve the highest quench rates. Methods are described which show that the experiments can be performed by precooling or preheating specimens in the range −170° to +1000°C. Calculational results for the quartz experiments show the importance of computational simulations to determine the pressure history in the specimen.

25005 (UCRL-JC–110564) **Comparison of weak-shock reflection factors for wedges, cylinders and blast waves.** Reichenbach, H. (Fraunhofer-Institut fuer Kurzzeitdynamik - Ernst-Mach-Institut (EMI), Freiburg im Breisgau (Germany)); Kuhl, A.L. Lawrence Livermore National Lab., CA (United States). Jul 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Contract DNA-IACRO-92-824;Contract DNA-001-91-C-0039. (CONF-9207202–1: 10. Mach reflection symposium, Denver, CO (United States), 20-23 Jul 1992). Order Number DE93014120. Source: OSTI; NTIS; GPO Dep.

Ernst Mach (1838–1916) was the first to discover an irregular reflection phenomenon of shock waves, as is well known in our community. In fact, this occurred in 1875 – three years earlier than usually assumed in the literature. A facsimile of the paper in which he mentioned a special shock wave behavior is shown in a figure. However, it is correct that Mach gave the physical interpretation of this phenomenon in 1878. Since Mach's discovery of an irregular shock reflection pattern 117 years ago, new shock configurations have been discovered – one of the most recent examples is the so-called "von Neumann reflection" for weak shocks as reported by Colella and Henderson in 1990. Due to active research efforts related to shock reflection, especially in the last two decades, we now have a relatively detailed understanding of reflection phenomena and of transition conditions from one reflection configuration to another. The purpose of this paper is to compare reflection factors for weak shocks from various surfaces, and to focus attention on

some unsolved questions. Three different cases are considered: (1) square-wave planar shock reflection from wedges, (2) square-wave planar shock reflection from cylinders and (3) spherical blast wave reflection from a planar surface. The authors restrict themselves to weak shocks. Following Henderson's definition, shocks with a Mach number of $M_0 < 1.56$ in air or with an overpressure of $\Delta p_i < 25$ psi (1.66 bar) under normal ambient conditions are called weak.

25006 (UCRL-JC–111173) **Laser system design for the generation of a sodium-layer laser guide star.** Friedman, H.W. Lawrence Livermore National Lab., CA (United States). Jan 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930159–32: OE/LASE '93: International Society for Optical Engineering (SPIE) conference, Los Angeles, CA (United States), 16-23 Jan 1993). Order Number DE93014127. Source: OSTI; NTIS; GPO Dep.

The design considerations for a laser system used to generate a sodium-layer guide star are presented. Laser technology developed for the Atomic Vapor Laser Isotope Separation (AVLIS) Program is shown to be directly relevant to this problem and results of a demonstration using the AVLIS laser to generate such a guide star are shown. The design of a compact laser suitable for use at a large telescope such as the Keck is also presented.

25007 (UCRL-JC–111495) **Image reconstruction for x-ray holographic microscopy.** Brase, J.; Yorkey, T.; Trebes, J. Lawrence Livermore National Lab., CA (United States). Sep 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920792–56: Society of Photo-Optical Instrumentation Engineers (SPIE) international symposium on optical applied science and engineering, San Diego, CA (United States), 19-24 Jul 1992). Order Number DE93013094. Source: OSTI; NTIS; GPO Dep.

This paper gives a basic overview of holography as applied to x-ray microscopy. Topics discussed include fourier transform holography, phase recovery from a hologram, reconstruction of scattered fields, and the use of straight ray approximations. Three dimensional spatial resolution below 100 nm is possible. (GH)

25008 (UCRL-JC–112713) **Turbulent wall jet in blast wave precursor.** Kuhl, A.L. Lawrence Livermore National Lab., El Segundo, CA (United States). Jan 1993. 38p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9301100–1: 1993 national symposium on shock waves, Sendai (Japan), 11-15 Jan 1993). Order Number DE93011955. Source: OSTI; NTIS; GPO Dep.

Numerical simulations of the turbulent dusty flow induced by an explosion over a ground surface were performed with a second-order Godunov code. Adaptive Mesh Refinement was used to capture the convective mixing processes on the computational grid. The most prominent feature of the flow was a turbulent wall jet that was induced by the precursor shock refraction into a thermal layer on the surface. Dust lofting occurred because the rotational structures of the boundary layer entrained dust from the ground surface. Scaling methods were defined in order to evaluate the mean and r.m.s. profiles of the wall jet. The profiles were shown to be similar to the profiles calculated for self-similar wall jets propagating over dust layers, and agreed with experimental profiles of a dusty boundary layer behind a shock. The Convective Mixing Model described here can be applied to a wide spectrum of fluid-dynamic mixing problems.

25009 (DOE/ER/40249–T1) **[Experimental research in high energy physics: Final technical progress report, 1986–1992].** California Univ., Santa Cruz, CA (United States). [1992]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AT03-86ER40249. Order Number DE93011912. Source: OSTI; NTIS; INIS; GPO Dep.

This is the closeout report for DOE supported research in high energy physics for the period 1986–1992, under contract award AT03-86ER40249 at the Santa Cruz Institute for Particle Physics (SCIPP) at U.C. Santa Cruz. The research during this period consisted primarily of the following: Data taking with the MARK II detector at the SLC at SLAC and construction of a silicon vertex detector for the MARK II. This effort included substantial work on commissioning of the SLC accelerator. Preparation of the SLD experiment for the SLC, and initial data taking with this experiment. Participation in the ALEPH physics program at LEP at CERN in Geneva, with an emphasis on its silicon vertex detector. Analysis of data collected with the MARK III experiment at the SPEAR accelerator at SLAC. Electronics development for the leading proton spectrometer for the ZEUS experiment at DESY in Hamburg. Design, testing and physics studies for a silicon tracker for the SSC. Theoretical physics program emphasizing phenomenology, Higgs physics, supersymmetry, and some issues in cosmology.

25010 (DOE/ER/40672–2) **Elementary particle physics and high energy phenomena: Progress report for FY93.** Barker, A.R.; Cumalat, J.P.; De Alwis, S.P.; DeGrand, T.A.; Ford, W.T.; Mahanthappa, K.T.; Nauenberg, U.; Rankin, P.; Smith, J.G. Colorado Univ., Boulder, CO (United States). Dept. of Physics. Jun 1992. 117p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40672. (COLO-HEP–314). Order Number DE93013971. Source: OSTI; NTIS; INIS; GPO Dep.

Experimental and theoretical high-energy physics programs at the University of Colorado are reported. Areas of concentration include the following: study of the properties of the Z^0 with the SLD detector; fixed-target K-decay experiments; the R&D program for the muon system: the SDC detector; high-energy photoproduction of states containing heavy quarks; electron–positron physics with the CLEO II detector at CESR; lattice QCD; and spin models and dynamically triangulated random surfaces. 24 figs., 2 tabs., 117 refs.

25011 (DOE/ER/40681–2) **[Experimental and theoretical high energy physics program].** Finley, J.; Gaidos, J.A.; Loeffler, F.J.; McIlwain, R.L.; Miller, D.H.; Palfrey, T.R.; Shibata, E.I.; Shipsey, I.P. Purdue Univ., Lafayette, IN (United States). Dept. of Physics. Apr 1993. 123p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40681. Order Number DE93013336. Source: OSTI; NTIS; INIS; GPO Dep.

Experimental and theoretical high-energy physics research at Purdue is summarized in a number of reports. Subjects treated include the following: the CLEO experiment for the study of heavy flavor physics; gas microstrip detectors; particle astrophysics; affine Kac–Moody algebra; nonperturbative mass bounds on scalar and fermion systems due to triviality and vacuum stability constraints; resonance neutrino oscillations; e^+e^- collisions at CERN; $\bar{p}$–p collisions at FNAL; accelerator physics at Fermilab; development work for the SDC detector at SSC; TOPAZ; D-zero physics; physics beyond the standard model; and the Collider Detector at Fermilab. (RWR)

25012 (DOE/FTR–93012250) **[Travel to China to give lectures at Shandong University, Qinghua University, and the Institute for High Energy Physics (IHEP)]: Foreign trip report, September 28, 1990–October 15, 1990.** Murphy, C.T. Fermi National Accelerator Lab., Batavia, IL (United States). 1 Oct 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE93012250. Source: OSTI; NTIS (US Sales Only); GPO Dep.

My collegues on Fermilab Experiment 771 from Shandong University, Jinan, China, wanted me to come to their university both to give lectures on High Energy Physics for students and to meet with their seniorleaders about our future collaboration. They arranged an invitation from the Ministry of Education, which paid all my expenses after arriving in China. There was an interest on my part to visit both former andpresent collegues at the Institute for High Energy Physics (IHEP), Beijing, and examine their work on our experiments (Fermilab experiments 782 and 740-D-Zero) at their home base. They wanted me to give two lectures at Qinghua University, Beijing, the best technical university in Beijing from which they draw most of their young researchers, so the two institutions jointly sponsored my visit to Beijing. I was accompanied by my wife, also their guest, who gave several lectures on American public health methods in both Beijing and Jinan and toured several hospitals and health facilities. She was enthusiastically received.

25013 (ORNL/FTR–4184) **Participation in the WA93 Collaboration meeting at CERN, and the second international**

workshop on software engineering, artificial intelligence, and expert systems for high energy and nuclear physics: Foreign trip report, January 3–20, 1992. Awes, T.C. Oak Ridge National Lab., TN (United States). 31 Jan 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93011087. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended the WA93 collaboration meeting at CERN, January 7–10. The traveler presented a talk on a method to estimate the combinatorial background using event mixing in order to obtain a more reliable extraction of the π^0 and η yield for the direct photon analysis. The traveler also presented current plans and simulation results for the PHENIX detector at RHIC. The traveler attended the Second International Workshop on Software Engineering, Artificial Intelligence, and Expert Systems for High Energy and Nuclear Physics.

25014 (DOE/ER/40427–32-N92) **Discrete space-time symmetries.** Henley, E.M. Washington Univ., Seattle, WA (United States). Dept. of Physics. [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-88ER40427. (CONF-9209332–1: Indian summer school, Sazava (Czech Republic), 7-10 Sep 1992). Order Number DE93010199. Source: OSTI; NTIS; INIS; GPO Dep.

Symmetries have always fascinated human beings; they are found in nature, art, and architecture. Physicists, like other scientists have often used symmetries as a basis of their understanding of nature. When the dynamics is unknown, symmetries serve to delineate and define it. When the dynamics is known, symmetries are used to study structure. These two lectures review the theory and present understanding and status of two discrete space-time symmetries,, namely parity (P) and time reversal (T).

25015 (DOE/ER/40427–36-N92) **Aspects of symmetry violation.** Henley, E.M. Washington Univ., Seattle, WA (United States). Dept. of Physics. [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-88ER40427. (CONF-921131–12: 10. international symposium on high-energy spin physics, Nagoya (Japan), 9-14 Nov 1992). Order Number DE93011003. Source: OSTI; NTIS; INIS; GPO Dep.

Violations of symmetries have been used to determine (or test) the theoretical dynamics or to study structure. Recent experiments on parity non-conservation and time reversal symmetry, and that depend on spin properties, are used to illustrate both applications.

25016 (JINR-D–2-92-44) **On the nature of mirror particles.** Takhtamyshev, G.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1992. [12p.] Order Number DE93626670. Source: OSTI; NTIS (US Sales Only); INIS.

Consequences of the experiments demonstrating non-conservation of spatial and combined (CP) parity are considered. A hypothesis is proposed according to which the results of the experiments do not contradict the mirror symmetry of our World. According to the hypothesis the fundamental particles (quarks and leptons) consist of moving constituents which do not possess charges of any of the three known interactions. Strong, weak and electromagnetic interactions arise as a result of internal motion of the constituents; on reversal of the direction of this motion a particle transforms into its antiparticle, whereas spatial inversion transforms usual particles into mirror ones (and vice versa). Consequences of the hypothesis for neutral kaons system are also considered and some experiments aimed at searching for mirror particles are suggested. 12 refs.

25017 (JINR-E–2-92-270) **Renormalizations in supersymmetric and nonsupersymmetric non-abelian Chern-Simons field theories with matter.** Avdeev, L.V.; Kazakov, D.I.; Kondrashuk, I.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [22p.] Order Number DE93626646. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Nucl. Phys., B.

We explicitly carry out the renormalization of nonabelian Chern-Simons field theories with matter in (2+1 dimensions). All the renormalization constants are calculated to the leading two-loop order both in terms of component fields and N=1 superfields for the fundamental representation of the SU(n), Sp(n) and SO(n) groups. Renormalization-group fixed points are found, and their stability properties are examined. It is shown that the N=2 supersymmetry is realized as an infrared fixed-point solution, where the ultraviolet divergencies cancel. 12 refs.; 2 figs.; 4 tabs.

25018 (JINR-E–4-92-282) **Supersymmetry of gauge equations and geometric nonadiabatic phases.** Suzko, A.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [11p.] Order Number DE93626671. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Physics Letters.

It is shown that nondiagonal elements of the connection operator A generate the nonadiabatic geometric phase in addition to Aharonov-Anandan one. The extra geometric phases are produced by A-singularities arising due to crossing of potential curves and in certain case of supersymmetry. The supersymmetric extension for the system of gauge equations is discussed. 15 refs.

25019 (JINR-E–5-92-326) **One-dimensional anharmonic oscillator in self- similar approximation.** Yukalova, E.P.; Yukalov, V.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [15p.] Order Number DE93626645. Source: OSTI; NTIS (US Sales Only); INIS.

A new method, called the method of self-similar approximations, is applied here for calculating the spectrum of the one-dimensional anharmonic oscillator. The advantage of this method is the possibility of reconstructing any sought function using only two first terms of perturbation theory. Notwithstanding such a limited information, the whole spectrum of the anharmonic oscillator can be found with a very good accuracy for all energy levels and all anharmonicity constants with the maximal error of an order 10^{-3}. 20 refs.; 2 tabs.

25020 (LA-UR–93-1511) **Parity nonconservation in proton scattering at higher energies.** Mischke, R.E. Los Alamos National Lab., NM (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930389–6: Future directions in particle and nuclear physics at multi-GeV hadron beam facilities, Upton, NY (United States), 4-6 Mar 1993). Order Number DE93012743. Source: OSTI; NTIS; INIS; GPO Dep.

A parity-nonconservation experiment in the scattering of longitudinally-polarized protons at an incident proton momentum of 6 GeV/c is examined. This experiment indicates a sharp rise with energy of the total cross section correlated with proton helicity that was unexpected. This energy dependence is due to the strong part of the interaction and may indicate the role of a diquark component in the nucleon. New experiments at higher energies are needed to confirm such a model. Future experiment can benefit from an analysis of sources of systematic error that have been encountered in the experiment discussed here.

25021 (BNL–48736) **Searches for strangelets and other exotics at the AGS.** Pile, P.H. Brookhaven National Lab., Upton, NY (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930173–6: HIPAGS meeting, Cambridge, MA (United States), 14-17 Jan 1993). Order Number DE93013341. Source: OSTI; NTIS; INIS; GPO Dep.

This article describes some experiments either completed, in progress or planned at the Brookhaven National Laboratory AGS. In particular, the experiments described are searches for exotic forms of matter. The existence of such matter could provide a clear signature for the deconfinement or rearrangement of quarks outside the bounds of normal baryons.

25022 (BNL–48760) **Standard model status (in search of "new physics").** Marciano, W.J. Brookhaven National Lab., Upton, NY (United States). Mar 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930389–3: Future directions in particle and nuclear physics at multi-GeV hadron beam facilities, Upton, NY (United States), 4-6 Mar 1993). Order Number DE93013288. Source: OSTI; NTIS; INIS; GPO Dep.

A perspective on successes and shortcomings of the standard model is given. The complementarity between direct high energy probes of new physics and lower energy searches via precision measurements and rare reactions is described. Several illustrative examples are discussed.

25023 (DOE/ER/40272–182) **Symmetric textures.** Ramond, P. (Florida Univ., Gainesville, FL (United States). Dept. of Physics). Florida Univ., Gainesville, FL (United States). Inst. for Fundamental Theory. [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-86ER40272. (UFIFT-HEP–93-7;CONF-9301103–1: Global Foundation International conference on unified symmetry in the small and in the large, Coral Gables, FL (United States), 25-27 Jan 1993). Order Number DE93011589. Source: OSTI; NTIS; INIS; GPO Dep.

The Wolfenstein parametrization is extended to the quark masses in the deep ultraviolet, and an algorithm to derive symmetric textures which are compatible with existing data is developed. It is found that there are only five such textures.

25024 (DOE/ER/40561–098) **Finite temperature QCD sum rules reexamined: ρ, ω, and A_1 mesons.** Hatsuda, Tetsuo (Washington Univ., Seattle, WA (United States). Inst. for Nuclear Theory); Koike, Yuji; Lee, Su Houng. Washington Univ., Seattle, WA (United States). Inst. for Nuclear Theory. [1992]. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-90ER40561 ;FG05-87ER40322. Order Number DE93011005. Source: OSTI; NTIS; INIS; GPO Dep.

A new formulation of the QCD sum rules at finite temperature (T) is developed. Because of the factorization in the operator product expansion, all the soft dynamics including the effect of finite T in the hadronic phase is taken into account in the thermal average of local operators $\langle$script-O$\rangle_T$. Unlike T = 0 case, (script-O)$_T$ has non-vanishing values for the Lorentz nonscalar operators such as $\bar{q}\gamma_\mu D_{\nu_1}q$. On the basis of the observation that the finite temperature medium can be well approximated by a dilute (non-interacting) pion gas at low T, one can make a sensible estimate of the T-dependence of various condensates, where the current algebra and the experimental information of the pion structure functions turn out to be a useful guide. This method is applied to the light vector mesons (ρ, ω and A_1), and it is found that the change of the four-quark condensate at T $\neq$ 0 is crucial to cause their mass shift. Associated with the partial restoration of the chiral symmetry, the ρ and A_1 meson masses obtained by the Borel sum rules decrease as T increases. The ω meson mass is rather stable at low T because of its iso-inglet nature. The lepton pair production rate from the hot hadronic medium near the ρ-resonance is calculated using the result of the sum rules and a considerable spectral change is shown above T = 160 MeV. This has direct relevance to the detection of the lepton pairs in the future projects of the ultra-relativistic heavy ion collisions such as RHIC and LHC.

25025 (JINR-E–2-92-103) **Quark-loop effects in high energy spin-flip processes.** Goloskokov, S.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [15p.] Order Number DE93626692. Source: OSTI; NTIS (US Sales Only); INIS.

On the basis of QCD model at large distances is analyzed the qq-sea contribution to the spin effects in the s->∞, t - fixed limit, it is shown that such effects lead to the spin-flip amplitude growing as s. The magnitude of spin-flip and spin-nonflip amplitudes is estimated within some models for quark and gluon propagators. The relative role of spin effects the wave function and the elementary quark subprocess is discussed too. It is shown that the quark-sea effects in the scattering amplitude can reach 30-40% oof the contribution of the simple two-gluon exchange at small momenta transfer. 10 refs.; 4 figs.

25026 (JINR-E–2-92-268) **Mesons at finite temperature in the NJL model with gluon condensate.** Ebert, D.; Kalinovskij, Yu.L.; Volkov, M.K. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [10p.] Order Number DE93626697. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Phys. Lett., Sect. B.

The QCD-motivated NJL-model with gluon condensate is studied at finite temperature and baryon number density. We investigate the behaviour of the constituent quark mass, quark condensate, meson masses, F_π, coupling constants $g_{\pi qq-bar}$, $g_{\sigma qq-bar}$ and Z as function of temperature T. It is shown that the gluon condensate plays a stabilizing role for behaviour of different physical quantities when temperature changes. 15 refs.; 5 figs.

25027 (JINR-E–2-92-269) **Multipolar-like form of nonabelian gauge theories.** Shirokov, M.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [14p.] Order Number DE93626690. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Ann. Phys.

A notion of the multipolar form of QED is exemplified by using its version valid for neutral systems such as two unlike charges. A new potential-like term $P_{perpendicular}$ arises in the multipolar Hamiltonian. It is shown to be a confining potential in a regularized variant of the multipolar form. This attracts interest to the discussion of multipolar-like form of nonabelian theories. The form is constructed for the case of nonquantized quarks intaracting with gluons. A confining potential is shown to arise which is similar to $P_{perpendicular}$. But its relevance to the quark confinement problem requires further investigations. 17 refs.

25028 (JINR-E–2-92-329) **Statistical approach to deconfinement in pure gauge models.** Shanenko, A.A.; Yukalova, E.P.; Yukalov, V.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [28p.] Order Number DE93626698. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Z. Phys., C.

We suggest a new statistical approach for considering deconfinement in SU(2) and SU(3) gluon systems. A mixture of coexisting glueballs and of the gluon plasma is shown to be thermodynamically more profitable than the corresponding pure phases. The interactions of gluons and glueballs are taken into account. Our results are in a very good agreement with numerical lattice calculations. 38 refs.; 11 figs.

25029 (LBL–33232) **Some new/old approaches to QCD.** Gross, D.J. Lawrence Berkeley Lab., CA (United States). Nov 1992. 20p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098. Grant PHY90-21984. (CONF-9209333–1: STRINGS '92, Rome (Italy), 2-8 Sep 1992). Order Number DE93010451. Source: OSTI; NTIS; INIS; OSTI; NTIS; INIS; GPO Dep.

In this lecture I shall discuss some recent attempts to revive some old ideas to address the problem of solving QCD. I believe that it is timely to return to this problem which has been woefully neglected for the last decade. QCD is a permanent part of the theoretical landscape and eventually we will have to develop analytic tools for dealing with the theory in the infra-red. Lattice techniques are useful but they have not yet lived up to their promise. Even if one manages to derive the hadronic spectrum numerically, to an accuracy of 10% or even 1%, we will not be truly satisfied unless we have some analytic understanding of the results. Also, lattice Monte-Carlo methods can only be used to answer a small set of questions. Many issues of great conceptual and practical interest-in particular the calculation of scattering amplitudes, are thus far beyond lattice control. Any progress in controlling QCD in an explicit analytic, fashion would be of great conceptual value. It would also be of great practical aid to experimentalists, who must use rather ad-hoc and primitive models of QCD scattering amplitudes to estimate the backgrounds to interesting new physics. I will discuss an attempt to derive a string representation of QCD and a revival of the large N approach to QCD. Both of these ideas have a long history, many theorist-years have been devoted to their pursuit-so far with little success. I believe that it is time to try again. In part this is because of the progress in the last few years in string theory. Our

increased understanding of string theory should make the attempt to discover a stringy representation of QCD easier, and the methods explored in matrix models might be employed to study the large N limit of QCD.

25030 (RAL–92-078) **Parton distributions updated.** Martin, A.D. (Durham Univ. (United Kingdom). Dept. of Physics); Stirling, W.J.; Roberts, R.G. Rutherford Appleton Lab., Chilton (United Kingdom). Nov 1992. [12p.] (DTP–92/80.). Order Number DE93626699. Source: OSTI; NTIS (US Sales Only); INIS.

We refine our recent determination of parton distributions with the inclusion of the new published sets of precise muon and neutrino deep inelastic data. Deuteron screening effects are incorporated. The tt-bar cross section at the Fermi National Accelerator Laboratory (FNAL) pp-bar collider is calculated. (author).

25031 (BNL–48595) **Strangeness production with protons and pions.** Dover, C.B. Brookhaven National Lab., Upton, NY (United States). [1993]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930239–1: We-Heraeus seminar: hadronic processes at small angles in storage rings, Bad Honnef (Germany), 1-3 Feb 1993). Order Number DE93010879. Source: OSTI; NTIS; INIS; GPO Dep.

We discuss the spectrum of physics questions related to strangeness which could be addressed with intense beams of protons and pions in the few GeV region. We focus on various aspects of strangeness production, including hyperon production in pp collisions, studies of hyperon-nucleon scattering, production of hypernuclei in proton and pion-nucleus collisions, and spin phenomena in hypernuclei.

25032 (BNL–48648) **HIJET with AGS physics and N*'s.** Longacre, R.S. Brookhaven National Lab., Upton, NY (United States). 11 Feb 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016 ;FG05-87ER40309 ;FG02-91ER40645 ;FG02-88ER40413. (CONF-930173–7: HIPAGS meeting, Cambridge, MA (United States), 14-17 Jan 1993). Order Number DE93014022. Source: OSTI; NTIS; INIS; GPO Dep.

We investigate the effects of secondary interactions in nucleus-nucleus and proton-nucleus collisions using a modified HIJET Monte Carlo generator. The effects of N* production is explored and it is found that the numbers of kaons can almost be explained by their inclusion. However the transverse momentum spectrum of the kaons is not explained, since their production in HIJET is a soft secondary scattering process and not a hot thermal process like the data.

25033 (CONF-9203159–9) **A review of two photon production of jets at PEP and PETRA energies.** Kofler, R.R. Massachusetts Univ., Amherst, MA (United States). Dept. of Physics and Astronomy. [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-85ER40194. From 9. international workshop on photon-photon collisions; San Diego, CA (United States); 22-26 Mar 1992. Order Number DE93011742. Source: OSTI; NTIS; INIS; GPO Dep.

Experimental results on the production of hadron jets in photon-photon interactions at PETRA and PEP are reviewed with special emphasis on the recent results from the TPC/2γ experiment at PEP. All results have been compared with the predictions of Vector Dominance and Quark Parton Models and the experiments all find excess jet production at low Q^2 and intermediate transverse momentum which cannot be explained on the basis of the simple VDM + QPM models.

25034 (CONF-921122–54-App.1) **Double semi-leptonic charm decay in helios-I 450 GeV/c p-Be data: Appendix 1.** Pierre, A. (Montreal Univ., PQ (Canada). Dept. of Physics); Pominanowski, P.A. Montreal Univ., PQ (Canada). Dept. of Physics. [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40646. From Meeting of the Division of Particles and Fields of the American Physical Society; Batavia, IL (United States); 10-14 Nov 1992. Order Number DE93013493. Source: OSTI; NTIS; INIS; GPO Dep.

Data taken in 1989 by HELIOS-I (NA34) at the CERN SPS (450 GeV/c proton beam on Be target) have been examined for $e^{\pm}\ \mu^{\mp}$ or $\mu^{\pm}\ \mu^{\mp}$ pairs with associated missing energy. Such pairs arise from semi-leptonic decay of both members of a $c\bar{c}$ pair. The $e\mu$ and $\mu\mu$ samples are consistent with expectations from charm decay, allowing a quantitative limit to be placed on other physics.

25035 (DOE/ER/40646–3) **Experimental particle physics at the University of Pittsburgh: Progress report, November 1, 1992–October 31, 1993.** Cleland, W.E.; Engels, E. Jr.; Humanic, T.J.; Perera, U.; Shepard, P.F.; Thompson, J.A. Pittsburgh Univ., PA (United States). Dept. of Physics and Astronomy. Apr 1993. 215p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40646. Order Number DE93013326. Source: OSTI; NTIS; INIS; GPO Dep.

During the past year on Task A, the HELIOS work drew to a close with first results from the electron-muon pair studies (no anomalous sources are seen, and the final results and uncertainties are being set). First data from CMD2 will allow improvement of some phi branching ratios, including some improved limits on forbidden decays. The engineering run for E865 is scheduled for June and July of 1993. The principal efforts of Task B, the Fermilab program, have been the completion of the analysis of the 1987–88 data with resulting publications, completion of the 1990–91 data run, and the beginning of the analysis of the 1990–91 data. In addition, the Task B group is taking a leadership role in developing a proposal to Fermilab for the upgrade of the CDF silicon vertex detector in preparation for the 1995 data run. Task C has recently submitted results of its fractionally charged particle searches, placing new upper limits on the abundance of naturally-occurring fractionally-charged particles in various materials. This group has recently been approved by the Brookhaven management for an exposure of their p-i-n diodes in a high intensity proton beam. This measurement, along with its subsequent analysis, will complete the program. Task D concerned itself with silicon drift chamber studies for the SSC. Task E was devoted to studies of electronics for the GEM Level 1 liquid Ar calorimeter trigger.

25036 (FNAL/C–93/047/E) **Inclusive jet cross sections at the Dν detector.** Astur, R.V. (State Univ. of New York, Stony Brook, NY (United States). Dept. of Physics). Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-921122–51: Meeting of the Division of Particles and Fields of the American Physical Society, Batavia, IL (United States), 10-14 Nov 1992). Order Number DE93012778. Source: OSTI; NTIS; INIS; GPO Dep.

The D0 calorimeter gives uniform response, hermetic coverage and stable calibration for detection of jets produced in $p\bar{p}$ collisions out to a pseudo-rapidity $|\eta| = 4.1$. Jet triggers are implemented for $|\eta| \leq 3.2$. We present preliminary distributions for inclusive jet production versus p_T.

25037 (FNAL/C–93/051-E) **Top quark search in Dν from the lepton + jets mode.** Klima, B. For the DO Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-921122–58: Meeting of the Division of Particles and Fields of the American Physical Society, Batavia, IL (United States), 10-14 Nov 1992). Order Number DE93014027. Source: OSTI; NTIS; INIS; GPO Dep.

The D0 collaboration has searched for Top quark production at $\sqrt{s} = 1.8$ TeV in $p\bar{p}$ collisions at Fermilab using a data sample corresponding to an integrated luminosity of 1.1 pb^{-1}, collected during the 1992 Tevatron run. We report the preliminary results of a search for $t\bar{t}$ production in which the Top quark decays to a W boson plus ab quark where one W decaying leptonically and the other decaying hadronically. Future prospects for extending the search for Top in the lepton plus jets channel are discussed.

25038 (IFVE-OMVT–90-75) **HECAR program package to calculate the cross sections for 2→3 reaction in electroweak interaction theory.** Larin, V.N.; Tikhonin, F.F. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov

(Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1990. [22p.] (In Russian). Order Number DE93626707. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to the collection 'Algorithms and algorithmic languages'.

A method for calculating the cross sections of physical processes is described in the framework of computer algebra system HECAS. It consists of two stages. The first is the obtaining of matrix element product MM^+, summed, if necessary, over final spins and averaged over the initial ones. The second stage is the procedure of removing of two particles out of an arbitrary number of them in the phase space. Here M may contain elements of arbitrary complexity obtained in the standard perturbative theory for the case of tree diagrams. The examples of using HECAS-program package in the case of $2 \rightarrow 3$ reaction are given. 16 refs.; 1 tab.

25039 (ISN–92-106) **Contribution at the study of nucleon-antinucleon interaction at low energy and at the proton-antiproton transition in two pions or kaons.** Elchikh, M. Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires. Oct 1992. [118p.] (In French). Order Number DE93626720. Source: OSTI; NTIS (US Sales Only); INIS.

This thesis contains a semi-phenomenological study of the Nucleon-Antinucleon interaction at low energy, and in particular of the annihilation of Proton-Antiproton system into two charged pions or kaons. This annihilation reaction is calculated within the DWBA (Distorted-Wave Born-Approximation) formalism: the transition into two mesons is treated as perturbation around the solution computed out of the whole interaction, including elastic forces and absorption. We first review the optical-potential models which describe the Nucleon-Antinucleon scattering in term of meson exchange supplemented by a complex core to simulate the effects of absorption. Those optical potentials provide the initial state for the annihilation reactions. The transition itself is described by mean of two models, a local one and a separable one. As for the local model, the results are generally in good agreement with experimental data, especially for the analyzing power, but the backward hemisphere for annihilation into two kaons cannot be reproduced. The separable model restricts the transition to S and P waves only, but leads rather naturally to an enhancement of the P wave with respect to the S wave, improving the global description of the angular distribution. This P to S ratio is intimately connected to the relative weight of quark annihilation and quark rearrangement diagrams. The true dynamics of those annihilation reactions presumably mixes our two models, with a transition operator being almost local in the high partial waves and nearly separable for the S and the P waves.

25040 (JINR-E–2-92-51) **Production of D-mesons in pp-collisions and quark-gluon string model.** Lykasov, G.I.; Sergeenko, M.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1992. [12p.] Order Number DE93626721. Source: OSTI; NTIS (US Sales Only); INIS.

The calculation results of the inclusive spectra of D-mesons produced in pp-collisions as the functions of the Feynman variable x and transverse momentum P-I are presented in the frame of the Quark-gluon string model. The satisfactory description of the experimental data in the frame of QGSM indicated domination of the peripheral mechanism of the D-meson production at high energies, 28 refs.; 6 figs.

25041 (JINR-E–2-92-89) **Large radiative corrections to the lowest-order processes in standard model.** Ivkin, A.V. (AN Kazakhskoj SSR, Alma-Ata (Kazakhstan). Inst. Fiziki Vysokikh Ehnergij); Koltochnic, S.N.; Nazirov, M.T.; Kuraev, E.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [10p.] Order Number DE93626709. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Nucl. Phys., B.

A scheme of calculation of logarithmically large radiations corrections (RC) to Born processes in the frame of the Standard Model (SM) for high energies is developed. Large values of RC are revealed for $e^+e^- \rightarrow W^+W^-$, ZZ, $Z\gamma$ both in the total cross-sections and in the differential ones, whereas they are absent in $\gamma\gamma$-collisions. This fact results in the effect of 'nonmonochromatism' of $e^\pm$-beams at lepton colliders with fixed energies higher than $\sqrt{s}>500$ GeV, which is analogous to nonmonochromatism of γ-beams produced by laser conversion. 14 refs.; 11 figs.

25042 (KFKI–1992-13/A) **Analysis of the KW distribution using a generalization of the Meijer's G-function.** Krasznovszky, S. (Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics). Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics. Mar 1992. [15p.] Order Number DE93626722. Source: OSTI; NTIS (US Sales Only); INIS.

The Krasznovszky-Wagner (KW) distribution can be used as a multiplicity distribution describing the hadron-hadron interactions and the e^+e^- annihilation for LEP energy. With the aid of the H-function of Fox the characteristic function of the KW distribution and the distributions of products, quotients and powers of independent KW-function variates were calculated. The KW distribution includes as special cases many of classical distributions, e.g., the exponential, the gamma, the chi-square, the Weibull, as well as some others which appear in physics. Several examples in connection with statistics and KNO scaling are given. (author) 19 refs.; 1 tab.

25043 (LA-UR–93-1388) **Eta production at the LAMPF P^3 channel.** Zumbro, J.D. Los Alamos National Lab., NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930389–8: Future directions in particle and nuclear physics at multi-GeV hadron beam facilities, Upton, NY (United States), 4-6 Mar 1993). Order Number DE93012679. Source: OSTI; NTIS; INIS; GPO Dep.

We discuss the pion flux that would be available at the P^3 channel at LAMPF with modifications to east leg of the channel. Modifications involve tayloring the optics of the channel to match the pion beam into a section of superconducting linac in both transverse dimensions and also longitudinally. The performance of this channel with these modification is discussed. The possible η flux with this channel is also discussed.

25044 (LA-UR–93-1471) $\mu^+ \rightarrow e^+\gamma$. Cooper, M.D. MEGA collaboration. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9304145–1: International workshop on low energy muon science (LEMS '93), Santa Fe, NM (United States), 4-8 Apr 1993). Order Number DE93012750. Source: OSTI; NTIS; INIS; GPO Dep.

The MEGA experiment at LAMPF is the only current search for $\mu^+ \rightarrow e^+\gamma$ underway. The limit on this rare muon-decay process tests the standard model of electroweak interactions. This report covers the status of the analysis of data taken in 1992 and the prospects for future improvements.

25045 (LA-UR–93-1502) **Some outstanding issues in pion scattering at energies above the Δ resonance.** Morris, C.L.; Zumbro, J.D. Los Alamos National Lab., NM (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930389–7: Future directions in particle and nuclear physics at multi-GeV hadron beam facilities, Upton, NY (United States), 4-6 Mar 1993). Order Number DE93012747. Source: OSTI; NTIS; INIS; GPO Dep.

The $\Delta(1232)$ resonance dominates pion-nucleon scattering at energies below 300 MeV, the region in which pion-nucleus scattering has been well studied using spectrometers at the meson factories. Above this energy region little pion-nucleus scattering data exists. Recently, spectrometers at Brookhaven, LAMPF, KEK, and DUBNA have been used to obtain initial data for pion-nucleus scattering in this energy region. In this talk we review some data that have been obtained using the LAS spectrometer at LAMPF.

25046 (LA-UR–93-1532) **No-lost "Theorem" for parity violating nucleon-nucleon scattering experiments.** Goldman, T. Los Alamos National Lab., NM (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930389–10: Future directions in particle and nuclear physics at multi-GeV hadron beam facilities, Upton, NY (United States), 4-6 Mar 1993). Order Number DE93012737. Source: OSTI; NTIS; GPO Dep.

A purely left-chiral model of the weak interactions is used to show that the total parity-violating asymmetry in quark-quark scattering must grow with increasing energy. In the absence of other new physics, non-observation of a large asymmetry can therefore be used to infer an upper bound on the mass scale for new right-chiral weak vector bosons. Applying this idea to actual nucleon-nucleon scattering requires more involved calculations, as the dominant contribution appears to come from a component of diquark-quark scattering related to, but not identical to, wavefunction-mixing. Earlier criticism of this model by Simonius and linger is refuted, and a new calculation is proposed as an additional check on the result. Finally, we argue that the so-called 'spin crisis' does not affect our conclusions.

25047 (ORNL/FTR–4336) **[Travel to attend the NATO Advanced Study Institute held at Il Ciocco, Italy]: Foreign trip report, July 10–26, 1992.** Young, G.R. Oak Ridge National Lab., TN (United States). 6 Aug 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012242. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler attended the NATO Advanced Study Institute on Particle Production in Highly Excited Matter held at Il Ciocco, Castelvecchio Pascoli, Italy, from July 13–24, 1992. He presented two 1-hour lectures: the first concerning basic processes producing continuum electromagnetic radiation in p - A collisions and related experimental data and the second extending the discussion of data and rates to heavy-ion collisions, with emphasis on detection of such radiation at RHIC. The broad area of relativistic heavy-ion collisions was covered by some 35 lecturers in a manner intended to be accessible to students within 2 to 3 years of the Ph.D degree. Several presentations were given by students.

25048 (SLAC–409) **Strange meson spectroscopy in Kω and Kϕ at 11 GeV/c and Cherenkov ring imaging at SLD.** Kwon, Youngjoon. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1993. 286p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. Order Number DE93013593. Source: OSTI; NTIS; INIS; GPO Dep.

This thesis consists of two independent parts; development of Cherenkov Ring Imaging Detector (CRID) system and analysis of high-statistics data of strange meson reactions from the LASS spectrometer. Part 1: The CRID system is devoted to charged particle identification in the SLAC Large Detector (SLD) to study e^+e^- collisions at $\sqrt{s} = m_{Z^0}$. By measuring the angles of emission of the Cherenkov photons inside liquid and gaseous radiators, π/K/p separation will be achieved up to ~30 GeV/c. The signals from CRID are read in three coordinates, one of which is measured by charge-division technique. To obtain a ~1% spatial resolution in the charge-division, low-noise CRID preamplifier prototypes were developed and tested resulting in <1000 electrons noise for an average photoelectron signal with 2×10^5 gain. To help ensure the long-term stability of CRID operation at high efficiency, a comprehensive monitoring and control system was developed. Part 2: Results from the partial wave analysis of strange meson final states in the reactions $K^-p \to K^-\omega p$ and $K^-p \to \bar{K}^0\phi n$ are presented. The analyses are based on data from a 4.1 event/nb exposure of the LASS spectrometer in K^-p interactions at 11 GeV/c. The data sample of $K^-\omega p$ final state contains ~10^5 events. From the partial wave analysis, resonance structures of $J^P = 2^-$, 3^- and 2^+ amplitudes are observed in the Kω system. The analysis of 2^- amplitudes provides an evidence for two strange meson states in the mass region around 1.75 GeV/c^2. The appropriate branching fractions are calculated and compared with the SU(3) predictions. The partial wave analysis of $\bar{K}^0\phi$ system favors $J^P = 1^-$ and 2^+ states in the 1.9–2.0 GeV/c^2 region.

25049 (SLAC-PUB–6068) **Novel spin effects in quantum chromodynamics.** Brodsky, S.J. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Feb 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-921131–10: 10. international symposium on high-energy spin physics, Nagoya (Japan), 9-14 Nov 1992). Order Number DE93010955. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses a number of interesting hadronic spin effects which test fundamental features of perturbative and non-perturbative QCD. These include constraints on the shape and normalization of the polarized quark and gluon structure functions of the proton; the principle of hadron helicity retention in high x_F inclusive reactions; predictions based on total hadron helicity conservation in high momentum transfer exclusive reactions; the dependence of nuclear structure functions and shadowing on virtual photon polarization; and general constraints on the magnetic moment of hadrons. I also will discuss the implications of several measurements which are in striking conflict with leading-twist perturbative QCD predictions, such as the extraordinarily large spin correlation A_{NN} observed in large angle proton-proton scattering, the anomalously large $\rho\pi$ branching ratio of the J/ψ, and the rapidly changing polarization dependence of both J/ψ and continuum lepton pair hadroproduction observed at large x_F.

25050 (BNL–48605) **Top and Higgs masses in a composite boson model.** Kahana, D.E. (Kent State Univ., OH (United States). Dept. of Physics); Kahana, S.H. Brookhaven National Lab., Upton, NY (United States). Jan 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-921122–48: Meeting of the Division of Particles and Fields of the American Physical Society, Batavia, IL (United States), 10-14 Nov 1992). Order Number DE93010874. Source: OSTI; NTIS; INIS; GPO Dep.

Recently Nambu as well as Bardeen, Hill and Linden have suggested replacing the Higgs mechanism with a dynamical symmetry breaking generated by four fermion interactions of the top quark. In fact the model for replacing the scalar sector is that of Nambu and Jona-Lasinio (NJL) and one recovers the Higgs as a tt composite. Earlier authors have also treated vector mesons as composites within the NJL framework, with perhaps the earliest suggestion being that of Bjorken for a composite photon. Here we attempt to generate the entire electroweak interaction from a specific current-current, baryon number conserving form of the four fermion interaction. The W, Z and Higgs boson appear as coherent composites of all fermions, quarks and lepton, and not just of the top quark. The four fermion interaction is assumed to be valid at some high mass scale μ, perhaps the low energy limit resulting by the elimination of non-fermionic degrees of freedom from a more basic theory. The cutoff Λ, necessary in the non-renormalizable NJL may be viewed then as the proper scale for this more basic theory.

25051 (FNAL/C–93/054-E) **Electron identification in the Dν detector.** Narain, M. For the DO Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-921122–59: Meeting of the Division of Particles and Fields of the American Physical Society, Batavia, IL (United States), 10-14 Nov 1992). Order Number DE93014028. Source: OSTI; NTIS; INIS; GPO Dep.

We present the techniques used to identify electrons in the D0 detector. The D0 electron identification algorithm is based on the full covariance matrix of energy deposits in the calorimeter cells occupied by an electromagnetic shower and information from the central tracking system. The method exploits the fine longitudinal and transverse segmentation of the D0 calorimeter to achieve excellent pion rejection. Performance criteria are derived from test beam electron and pion data and from collider data.

25052 (JINR-R–2-92-35) **Proton angular distribution in the decay of possible diproton resonances.** Lyuboshits, V.L. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1992. [14p.] (In Russian). Order Number DE93626781. Source: OSTI; NTIS (US Sales Only); INIS.

The classification if a two-proton system with a fixed total angular momentum over LS-states and spherical helicity states is given. Connection between the direction of a two-particle decay and the spin-quantization is discussed. 16 refs.

25053 (LA-UR–93-1243) **The effect of a scalar boson coupled to neutrinos on the behavior of the tritium beta decay spectrum near the end point.** Stephenson, G.J. Jr. Los Alamos National Lab., NM (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930187–2: 13. Moriond workshop on perspectives in neutrinos, atomic physics, and gravitation, Villars-sur-Ollon (Switzerland), 30 Jan - 6 feb 1993). Order Number DE93012655. Source: OSTI; NTIS; INIS; GPO Dep.

Some consequences of a very light scalar boson coupled only to neutrinos are discussed. In particular, I argue that it is possible to sketch scenarios for the evolution of the Universe in which neutrinos cluster to a local density $\approx 10^{16}$ /cc, that such clusters would be attracted to matter gravitationally, and that the existence of such a neutrino density in the solar system provides an alternative to $m_{-\nu e}^2 < 0$ in fitting tritium beta decay.

25054 (SSCL-Preprint–241) **Quark and lepton masses.** Meshkov, S. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–5: 5. annual international industrial symposium on the Super Collider and exhibition; Global Foundation International conference on unified symmetry in the small and in the large, San Francisco, CA (United States); Coral Gables, FL (United S Order Number DE93012308. Source: OSTI; NTIS; INIS; GPO Dep.

The BCS mechanism, augmented by an ad hoc, but reasonable symmetry breaking mechanism, describes both the quark and lepton masses, and is consistent with the constraints imposed by the Cabbibo, Kobayashi, Maskawa mixing matrix. This mechanism may be incorporated into the study of various extensions of the Standard Model such as SUSY SU(5). The symmetry breaking at the unification scale is related to that at experimentally accessible scales by running the coefficients of the terms in the mass matrices characterized by their symmetries.

1979 research work emphasized such areas as neutron cross section measurements, neutron polarization studies, high-resolution proton elastic and inelastic scattering, charged-particle reactions with polarized beams, radiative capture reactions, nuclear theory and phenomenology, atomic physics, ion source development, accelerator development and instrumentation, and computer-related development. Many brief summaries of specific projects are presented. Although data are included with a number of these, it may reasonably be assumed that completed work is reported in detail in appropriate publications.

The IAEA Advisory Group Meeting (AGM) on The Influence of Target and Sample Properties on Nuclear Data Measurements was held at the Gesellschaft fuer Schwerionenforschung mbH, Darmstadt, Federal Republic of Germany, during the week 5-9 September 1988. The AGM (hereafter "Meeting") was held concurrently during the 14th World Conference (hereafter "Conference") of the International Nuclear Target Development Society (INTDS) in co-operation with the IAEA-International Nuclear Data Committee (INDC). The Meeting's special sessions (5th, 7th and 9th September 1988) were held to review and prepare the summary of the papers presented to the Conference and recommendations on the objectives of the AGM. The contributed papers to the Conference are to be published in the Journal Nuclear Instruments and Methods in Physical Research. The contributed notes to the Meeting's special sessions together with the summary of the contributed papers by the Agency's invitees and the discussions during the Meeting's special sessions and the recommendations are issued in this report. (author). Refs, figs and tabs.

data measurements: Summary report of the IAEA advisory group meeting in co-operation with the International Nuclear Target Development Society (INTDS), held in Darmstadt, Germany, 5-9 September 1988. [74p.] Order Number DE93626092. Source: OSTI; NTIS (US Sales Only); INIS.

A broad review of different kinds of in-beam nuclear spectroscopy measurements particularly influenced by the target properties is outlined. To illustrate such an influence a few typical examples of in-beam electron and gamma-ray spectroscopy measurements, performed at the Orsay MP Tandem accelerator, are reported. In particular several applications of the recoil ion catcher method in the study of short-lived nuclear isomers (with half-lives between ten and few hundred nanoseconds) are briefly described. This method is operated mostly with a pulsed heavy ion beam, bombarding a thin self-supported target but avoiding hitting the catcher foil. Moreover, the time of flight filtering properties of this experimental device is improved by a fast detection of compound nucleus deexcitation (performed with an array of several BaF_2 crystals). This kind of measurement shows clearly the importance of the target qualities as well as the need of good focusing properties and time structure for the accelerated particle beam. Finally, the required characteristics of the targets and recoil stopper foils needed for these measurements (and similar ones performed with the recoil ion shadow method) are analyzed in detail for a few typical experimental arrangements. (author). Abstract only.

25061 (UCRL-JC–111831) **The LLNL interactive system for nuclear data evaluation.** Resler, D.A.; White, R.M. Lawrence Livermore National Lab., CA (United States). Oct 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921046–17: Symposium on nuclear data evaluation methodology, Upton, NY (United States), 12-16 Oct 1992). Order Number DE93013350. Source: OSTI; NTIS; INIS; GPO Dep.

LLNL's interactive system for nuclear data evaluation uses a general-purpose two-dimensional graphics code, QPX. With simple commands, the authors access and plot any information in the Livermore evaluated neutron data library (ENDL), activation library (ACTL), or charged-particle library (ECPL), the Livermore experimental cross section information library (ECSIL), or any evaluated data library using the ENDF format. Features of this system important to evaluation work are discussed. The conversion of evaluations from the ENDF format to the ENDL format for use in this system is discussed.

Radioactive beam experiments have made it possible to study the structure of nuclei at the neutron drip line. Pair correlations play a crucial role in such nuclei and characteristic features include an extended neutron halo density and a large dipole strength near threshold. The most detailed studies have been performed for ^{11}Li. I will present a 3-body model that explains the main features of the data obtained for this nucleus.

25063 (CONF-9205108–19) **Tracking intruder states.** Riedinger, L.L.; Mueller, W.F.; Yu, C.H. Tennessee Univ., Knoxville, TN (United States). Dept. of Physics and Astronomy. [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-87ER40361. From International conference on nuclear structure at high angular momentum; Ottawa (Canada); 18-21 May 1992. Order Number DE93014276. Source: OSTI; NTIS; INIS; GPO Dep.

The deformation-driving effects of intruder states are studied by analysis of various types of data on rotational bands in rare-earth deformed nuclei. The sensitivity of four measurables (bandhead energy, B(E2) value, neutron $i_{13/2}$ crossing frequency, and signature splitting) to increase deformation in an intruder band is shown. The analysis of signature splitting systematics is extended to know superdeformed bands.

25064 (CONF-9209342–1) **The Fermion Dynamical Symmetry Model and superdeformation.** Guidry, M.W. (Tennessee Univ., Knoxville, TN (United States). Dept. of Physics). Oak Ridge National Lab., TN (United States). 2 Oct 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ;FG05-87ER40361. From International conference on nuclear structure and nuclear reactions at low and intermediate energies; Dubna (Russian Federation); 15-19 Sep 1992. Order Number DE93013273. Source: OSTI; NTIS; INIS; GPO Dep.

The Fermion Dynamical Symmetry Model is extended beyond a single major shell and used to construct a new model of superdeformation.

25065 (CONF-9211199–5) **Dynamical symmetry and shape coexistence.** Guidry, M. (Tennessee Univ., Knoxville, TN (United States). Dept. of Physics and Astronomy). Oak Ridge National Lab., TN (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Symposium on nuclear physics of our times; Sanibel Island, FL (United States); 17-21 Nov 1992. Order Number DE93013211. Source: OSTI; NTIS; INIS; GPO Dep.

A general discussion is given of extending the Fermion Dynamical Symmetry Model to describe shape coexistence. The theory is applied to the description of superdeformation and normal deformations through alternative dynamical symmetries.

25066 (CONF-9211199–7) **Nuclear superdeformation.** Nazarewicz, W. (Oak Ridge National Lab., TN (United States)). Oak Ridge National Lab., TN (United States); Tennessee Univ., Knoxville, TN (United States). Dept. of Physics. [1992]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ;FG05-87ER40361 ;FG05-93ER40770. From Symposium on nuclear physics of our times; Sanibel Island, FL (United States); 17-21 Nov 1992. Order Number DE93012968. Source: OSTI; NTIS; INIS; GPO Dep.

In the year 1986 new types of exotic states, the so-called superdeformed states, were discovered in fast rotating heavy atomic nuclei. They are characterized by an unusually large distortion (comparable to that appearing in fissioning isomers) and occur at high angular momenta. A sizeable amount of high-spin data on superdeformed states makes it possible, for the first time, to test many fine details of the shell structure at very large elongations and very high angular momentum.

25067 (DOE/ER/40159–199) **The structure of nuclei far from stability: Progress report, May 15, 1992–May 14, 1993.** Zganjar, E.F. Louisiana State Univ., Baton Rouge, LA (United States). Dept. of Physics and Astronomy. 1993. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-84ER40159. Order Number DE93013376. Source: OSTI; NTIS; INIS; GPO Dep.

Studies on nuclei near Z=82 contributed to the establishment of a new region of nuclear deformation and a new class of nuclear structure at closed shells. A important aspect of this work is the establishment of the connection between low-lying 0^+ states in even–even nuclei and the occurrence of shape coexistence in the odd-mass neighbors (E0 transitions in ^{185}Pt, shape coexistence in ^{184}Pt and ^{187}Au). A new type of picosecond lifetime measurement system capable of measuring the lifetime of states that decay only by internal conversion was developed and applied to the ^{186,188}Tl decay to determine the lifetime of the 0_2^+ and 2_2^+ deformed states in ^{186,188}Hg. A search for the population of superdeformed states in ^{192}Hg by the radioactive decay of ^{192}Tl was accomplished by using a prototype internal pair formation spectrometer.

25068 (EGG-M–92648) **The level at a few EV of excitation in ^{229}Th.** Reich, C.W.; Helmer, R.G. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9211199–4: Symposium on nuclear physics of our times,

Sanibel Island, FL (United States), 17-21 Nov 1992). Order Number DE93010790. Source: OSTI; NTIS; INIS; GPO Dep.

Several years ago, we reported that there was an excited state of ^{229}Th that occurred within a few electron volts of the ground state. Since that time, we have carried out an extensive series of measurements in an effort to obtain a value, rather than merely a limit, for the excitation energy of this level. This study has now been completed. Analysis of these data, which is still in progress, indicates that this level energy is 4.5 eV, with an estimated uncertainty of 1 eV.

25069 (JINR-E-4-92-124) **Influence of giant angular resonances on the electromagnetic characteristics of low-lying states.** Mikhajlov, I.N.; Usmanov, P.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [26p.] Order Number DE93626797. Source: OSTI; NTIS (US Sales Only); INIS.

The two-rotor model with the Feshbach projection operator method is applied for investigating the properties of the positive parity low-lying collective states in the rare earth nuclei. The calculations of the energy spectra, E2-transition probability and magnetic propertiesd of the states of $\beta$$-and γ-bands tothe ground band are estimated. 26 refs.; 6 figs.; 8 tabs.

25070 (LBL–33903) **β^+ decay and cosmic-ray half-life of ^{54}Mn.** da Cruz, M.T.F. (Lawrence Berkeley Lab., CA (United States)); Norman, E.B.; Chan, Y.D.; Garcia, A.; Larimer, R.M.; Lesko, K.T.; Stokstad, R.G.; Wietfeldt, F.E.; Hindi, M.M.; Zlimen, I. Lawrence Berkeley Lab., CA (United States). 29 Mar 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098 ;FG05-87ER40314. (CONF-930779–13: International cosmic-ray conference, Calgary (Canada), 19-20 Jul 1993). Order Number DE93013913. Source: OSTI; NTIS; INIS; GPO Dep.

We performed a search for the β^+ branch of ^{54}Mn decay. As a cosmic ray, ^{54}Mn, deprived of its atomic electrons, can decay only via β^+ and β^- decay, with a half-life of the order of 10^6 yr. This turns ^{54} Mn into a suitable cosmic chronometer for the study of cosmic-ray confinement times. We searched for coincident back-to-back 511-keV γ-rays using two germanium detectors inside a NaI(Tl) annulus. An upper limit of 2×10^{-8} was found for the β^+ decay branch, corresponding to a lower limit of 13.7 for the log ft value.

25071 (ORNL/FTR–4219) **[Travel to France to attend and present two invited talks at the international workshop on the physics techniques of secondary nuclear beams at Dourdan, France]: Foreign trip report, March 21–26, 1992.** Trivelpiece, A.W. Oak Ridge National Lab., TN (United States). 6 Apr 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93010573. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The primary purpose of this foreign travel was to attend the International Workshop on the Physics Techniques of Secondary Nuclear Beams and to present two invited talks. The scientific and technical portions of the program are summarized as is the organization of the European effort to construct radioactive beam facilities for nuclear structure and astrophysics. Another topic of discussion was the European effort in developing advanced gamma-ray detection facilities. The traveler also summarizes this effort.

6632 Radioactivity and Electromagnetic Transitions (Excluding Fission)

25072 (CONF-9210249–10) **Influence of dissipation of the population and decay of compound nuclei.** Thoennessen, M. (Michigan State Univ., East Lansing, MI (United States)); Beene, J.R. Oak Ridge National Lab., TN (United States). [1992]. 15p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC05-84OR21400. Grant: PHY-89-13815. From 1992 international symposium on rapidly rotating nuclei; Tokyo (Japan); 26-30 Oct 1992. Order Number DE93009668. Source: OSTI; NTIS; INIS; GPO Dep.

The importance of nuclear dissipative effects in the formation and decay of compound nuclei is investigated with the γ-ray decay of the giant dipole resonance built on highly excited states. These studies show evidence for long formation times ($\sim 10^{-20}$s) in heavy, almost symmetric systems. Enhanced γ-ray emission is observed in the decay of fissile nuclei because of the dynamical hindrance of fission. This effect allows the study of hot nuclei prior to fission and it also influences the spin distribution leading to evaporation residues.

25073 (DOE/ER/40427–21-N92) **Double beta decay: Comparison of theory to experiment.** Haxton, W.C. Washington Univ., Seattle, WA (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-88ER40427 ;FG06-90ER40561. (CONF-9206227–7: 15. international conference on neutrino physics, Granada (Spain), 7-13 Jun 1992). Order Number DE93010201. Source: OSTI; NTIS; INIS; GPO Dep.

I review $\beta\beta$ decay in the standard model and as a test of Majorana neutrino masses and right-handed couplings. A summary is given of some of the nuclear physics issues involved in evaluating 2 ν and 0ν matrix elements. Dirac and pseudoDirac limits are discussed to illustrate how quantities constrained on 0ν $\beta\beta$ decay depend on the parameters of the mass matrix. Implications of 0ν $\beta\beta$ decay for models with 17 keV neutrinos, for models with massive Majorana neutrinos, and for Majorons are discussed. It is argued that a recent remeasurement of the total $\beta\beta$ decay rate of ^{128}Te is important in constraining (nonstandard) Majoron models.

25074 (DOE/FTR–93013556) **Travel to Germany to attend the 6th international conference on nuclei far from stability and 9th international conference on atomic masses and fundamental constants: Foreign trip report, July 18–25, 1992.** Mantica, P.F. Jr.; Carter, H.K. Oak Ridge Inst. for Science and Education, TN (United States). 9 Sep 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-76OR00033. Order Number DE93013556. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of this foreign travel was to attend and to present posters covering recent UNISOR work at the combined conferences: "6th International Conference on Nuclei far from Stability and 9th International Conference on Atomic Masses and Fundamental Constants". The scientific and technical points of particular interest to UNISOR research as determined through the presentations and private discussions are briefly summarized.

25075 (IPNO-DRE–92-31) **Transfer results for odd-odd ^{196}Au and the extended supersymmetry.** Rotbard, G. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire); Berrier, G.; Vergnes, M.; Fortier, S.; Kalifa, J.; Maison, J.M.; Rosier, L.; Vernotte, J.; Van Isacker, P.; Jolie, J. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1992. [25p.] Order Number DE93626833. Source: OSTI; NTIS (US Sales Only); INIS.

^{196} Au has been studied with an energy resolution of 12 keV via the ^{197} Au(p,d)^{196} Au reaction, using a 25 MeV proton beam from the Orsay MP tandem and the split pole spectrometer. The angular distributions, measured at 12 angles, permit to clearly characterize the l = 1.3 and 6 transfers. Data concerning the energies, I values and absolute spectroscopic factors have been obtained; a comparison is made, for negative parity levels, between these results and theoretical energies, spins and strengths calculated in the framework of the extended supersymmetry. A preliminary level scheme is proposed for ^{196} Au and a few tentative spin attributions are suggested.

25076 (IPNO-DRE–92-34) **Decay properties of exotic N $\simeq$ 28 S and Cl nuclei and the ^{48}Ca/^{46}Ca abundance ratio.** Sorlin, O. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire); Guillemaud-Mueller, D.; Mueller, A.C.; Borrel, V.; Dogny, S.; Pougheon, F.; Kratz, K.L.; Gabelmann, H.; Pfeiffer, B.; Woehr, A.; Ziegert, W.; Penionzhkevich, Y.E.; Lukyanov, S.MParis-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1992. [25p.] Order Number DE93626834. Source: OSTI; NTIS (US Sales Only); INIS.

Beta-decay half-lives and β-delayed neutron-emission probabilities of the very neutron-rich nuclei ^{44}S and $^{45-47}$ Cl have been measured. These isotopes, which lie at or close to the N=28 magic shell were produced in interactions of a 60 MeV/u ^{48} Ca beam from

GANIL (Grand Accelerateur National d'Ions Lourds) with a ^{64} Ni target and were separated by the doubly achromatic spectrometer LISE (Ligne d'Ions Super Epluches). Their decay was studied by a β-n time correlation measurement. The results are compared to recent model predictions and indicate a rapid weakening of the N=28 shell effect below $^{48}_{20}Ca_{28}$. The nuclear structure effects reflected in the decay properties of the exotic S and Cl isotopes may be the clue for the astrophysical understanding of the unusual ^{48} Ca/^{46}Ca abundance ratio measured in the solar system as well as the Ca-Ti-Cr anomalies observed in EK-inclusions of the Allende meteorite.

25077 (IPNO-T–92-02) **Measurement of beta decay periods for Fe-Ni neutrons rich isotopes.** Czajkowski, S. (Paris-7 Univ., 75 (France)). Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 27 May 1992. [116p.] (In French). Order Number DE93626835. Source: OSTI; NTIS (US Sales Only); INIS.

Thermal fission of ^{239} Pu was used to produce ^{68,69} Co and ^{68} Fe isotopes, the lightest ones ever observed in thermal fission, at the ILL high-flux reactor, in Grenoble. Separated with the Lohengrin recoil spectrometer, then identified by means of a Δ E-E ionization chamber, fragments were implanted in a set of Si-detectors, where β-particles were detected too. The fission yields were determined, and the beta-decay half-lives were extracted from delayed coincidence analysis between ion implantation and the subsequent beta detection: They were found to be 0.27 ± 0.05s, 0.18 ± 0.10s, and 0.10 ± 0.06s respectively for ^{69} Co, ^{68} Co, and ^{68} Fe. This method was adapted to a new experimental configuration: ^{65} Fe isotopes were produced from ^{86} Kr projectile fragmentation at 500 MeV/u on a Be target. Selected ions were separated with the fragment separator FRS at GSI (Darmstadt), tuned in the monoenergetic mode. Fragments were identified by ΔE-ToF, slowed down, and then implanted in two rows of PIN-diodes that provided an additional range selection. The half-life were determined from the analysis of the decay chain Fe-Co-Ni: it was found 0.4 ± 0.2s. Production rates obtained with the two methods are compared at the end of this work.

25078 (KFKI–1992-15/A) **Measurable distributions of unpolarized neutron decay.** Glueck, F. (Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics). Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics. May 1992. [23p.] Order Number DE93626836. Source: OSTI; NTIS (US Sales Only); INIS.

Several two- and one-dimensional distributions of unpolarized free neutron decay are calculated. The results of the order-α model independent radiative correction calculations are tabulated numerically. With these corrections the theoretical distributions become precise enough to make possible the determination of the ratio of the axial-vector to the vector weak coupling constants to a precision of $\approx$0.001. (author) 39 refs.; 7 tabs.

25079 (LBL–33959) **β^+ decay and cosmic-ray half-lives of ^{143}Pm and ^{144}Pm.** Hindi, M.M. (Tennessee Technological Univ., Cookeville, TN (United States). Dept. of Physics); da Cruz, M.T.F.; Larimer, R.M.; Lesko, K.T.; Norman, E.B.; Sur, B.; Champagne, A.E. Lawrence Berkeley Lab., CA (United States). 12 Apr 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098 ;FG05-87ER40314. (CONF-930779–12: International cosmic-ray conference; Calgary (Canada), 19-20 Jul 1993). Order Number DE93013819. Source: OSTI; NTIS; GPO Dep.

The positron decay partial half-lives of ^{143}Pm and ^{144}Pm are needed to assess the viability of elemental Pm as a cosmic-ray clock. We have conducted experiments to measure the β^+ branches of these isotopes; we find β^+ branches of these isotopes; we find β^+ branches of $<5.7\times10^{-8}$ for ^{143}Pm and $<8\times10^{-7}$ for ^{144}Pm. Through these branches are a factor of 20 lower than the previous experimental limits, the resulting partial half-lives are still too uncertain to permit any firm conclusions.

25080 (ORNL/TM–12358) **Analysis of Fe(n,xγ) cross sections using the TNG nuclear reaction model code.** McCollam, K.J. Oak Ridge National Lab., TN (United States). Apr 1993. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ;AC05-76OR00033. Order Number DE93013474. Source: OSTI; NTIS; INIS; GPO Dep.

Theoretical gamma ray cross sections have been calculated using a nuclear reaction model code. These are compared to experimental gamma ray production cross sections obtained from neutron interactions with ^{56}Fe at incident neutron energies of 1 to 40 MeV. The optical model and nuclear level density parameters in the code have been varied to affect a close agreement between calculations and the data. Present analyses, which focus on incident neutron energies between 17 and 40 MeV, display somewhat better agreement than those previously reported.

25081 (DOE/ER/40437–4) **Pion correlations and calorimeter design for high energy heavy ion collisions: Progress in research, 1992.** Wolf, K.L. Texas A and M Univ., College Station, TX (United States). Cyclotron Inst. 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-88ER40437. Order Number DE93013861. Source: OSTI; NTIS; INIS; GPO Dep.

The 1992 research program is reported under the following topics: The EOS time projection chamber program; the NA44 experiment at CERN; sampling calorimeter construction.

25082 (DOE/ER/40530–8) **Stochastic two-fluid model for relativistic heavy-ion collisions.** Ayik, S. (Tennessee Technological Univ., Cookeville, TN (United States)); Ivanov, Y.B.; Russkikh, V.N.; Noerenberg, W. Tennessee Technological Univ., Cookeville, TN (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-89ER40530. (CONF-930197–2: 9. winter workshop on nuclear dynamics, Key West, FL (United States), 30 Jan - 6 feb 1993). Order Number DE93011272. Source: OSTI; NTIS; INIS; GPO Dep.

A reduction of the relativistic Boltzmann-Langevin Equation (BLE), to a stochastic two-fluid model is presented, and transport coefficients associated with fluid dynamical variables are extracted. The approach is applied to investigate equilibration in a counter-streaming nuclear system.

25083 (ECN-RX–92-066) **Quantummechanical multi-step direct models for nuclear data applications.** Koning, A.J. (Netherlands Energy Research Foundation (ECN), Petten (Netherlands)). Netherlands Energy Research Foundation (ECN), Petten (Netherlands). Oct 1992. [8p.] (CONF-921046–: Symposium on nuclear data evaluation methodology, Upton, NY (United States), 12-16 Oct 1992). Order Number DE93626845. Source: OSTI; NTIS; INIS.

Various multi-step direct models have been derived and compared on a theoretical level. Subsequently, these models have been implemented in the computer code system KAPSIES, enabling a consistent comparison on the basis of the same set of nuclear parameters and same set of numerical techniques. Continuum cross sections in the energy region between 10 and several hundreds of MeV have successfully been analysed. Both angular distributions and energy spectra can be predicted in an essentially parameter-free manner. It is demonstrated that the quantum-mechanical MSD models (in particular the FKK model) give an improved prediction of pre-equilibrium angular distributions as compared to the experiment-based systematics of Kalbach. This makes KAPSIES a reliable tool for nuclear data applications in the aforementioned energy region. (author). 10 refs., 2 figs.

25084 (KFKI–1992-23/G) **Objective judgement by Kalman filtering in the generalized Landsbergian scheme.** Lukacs, B. (Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics); Racz, A. Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics. Aug 1992. [17p.] Order Number DE93626846. Source: OSTI; NTIS (US Sales Only); INIS.

A method is suggested to check if a non-equilibrium thermodynamic description of a system is complete. Exploring Landsberg's idea of the role of third person, a scheme is proposed for treating non-equilibrium systems as well. In order to suppress irrelevant information carried by measurement noise or for very fast phenomena, Kalman filter can act as the objective spectator. The idea is illustrated via a thermodynamic model of non-relativistic heavy ion collisions. (author) 12 refs.; 3 figs.

New versions of EFF, ENDF/B, FENDF, and JEF evaluated nuclear data files have recently been released for benchmarking purposes. All data files have adopted the ENDF-6 format for describing the physics which includes new representations of data to allow more recent nuclear theory to be used in evaluations and improved treatment in applications. NJOY has been adopted by many laboratories and projects worldwide for processing ENDF-6 format data files. During the past several years, large segments of NJOY were rewritten with some adverse effects on the continuity of both national and international programs. The primary aim of the seminar was to bring together authors and users of the NJOY code system and evaluated data files to present the most recent code developments, discuss performance, and exchange know-how and methods for efficient processing of evaluations. The seminar was suggested and encouraged by the OECD NEA Data Bank Management Committee and the JEF Scientific Coordination Group. The traveler is actively involved in several multigroup cross section development projects using NJOY91 at ORNL.

25086 (ANL/EP/CP–79504) **Integral measurement of ^{9}Be(n,2n)^{8}Be in the ^{9}Be(d, n) neutron spectrum.** Meadows, J.W. (Argonne National Lab., IL (United States)); Smith, D.L.; Greenwood, L.R.; Kneff, D.W.; Oliver, B.M. Argonne National Lab., IL (United States). [1993]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9305125–1: International workshop on nuclear data for fusion reactor technology, San Diego, CA (United States), 3-6 May 1993). Order Number DE93012943. Source: OSTI; NTIS; INIS; GPO Dep.

^{4}He production has been measured, by an isotopic dilution mass spectrometry method, for the irradiation of Be-metal samples by fast neutrons from the ^{9}Be(d,n) source reaction, corresponding to 7-MeV deuterons incident on a thick Be-metal target. The ^{58}Ni(n,p)$^{58g+m}$Co dosimetry reaction was employed as a reference standard for measurement of the neutron flux. The integral cross section for the ^{9}Be(n,2n)^{8}Be(2^{2}He) reaction was deduced by applying a correction of 9.4% to account for the ^{9}Be(n,α)^{6}He reaction contribution to the total ^{4}He yield from neutrons on Be. The experimental integral reaction cross-section ratio of ^{9}Be(n,2n)2^{4}He to ^{58}Ni(n,p)$^{58g+m}$Co in this spectrum was found to be 1.217, with an error of $\sim$ 3.5%. This can be compared to the corresponding calculated ratio of 1.161, based on an average of results obtained by considering four distinct representations of the ^{9}Be(d,n) neutron spectrum and ENDF/B-VI values for the reaction cross sections. The scatter of the calculated results amounts to $\sim$ 0.3%. It is small because the shapes of the response functions, $R(E)=\phi(E)\sigma(E)$, for these two reactions in this neutron spectrum are very similar. The observed C/E is 0.954. This is excellent agreement, considering the various uncertainties involved, including those for the differential cross sections from ENDF/B-VI.This particular integral measurement is sensitive to the differential reaction cross section in the range 3–6 MeV. Therefore, the results of the present investigation indicate that ENDF/B-VI represents the ^{9}Be(n,2n)2^{4}He reaction differential cross section quite well in this energy range.

25087 (BNL–48587) **Global transverse and forward energy measurements for Si+A and Au+A at the AGS.** Moskowitz, B. E802/866 Collaboration. Brookhaven National Lab., Upton, NY (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States); US-Japan High Energy Physics Collaboration. DOE Contract AC02-76CH00016. (CONF-930173–3: HIPAGS meeting, Cambridge, MA (United States), 14-17 Jan 1993). Order Number DE93010934. Source: OSTI; NTIS; INIS; GPO Dep.

The global transverse and forward energy from Si+Al,Au at 14.6A GeV/c and Au+Al,Au, at 11.6A GeV/c have been measured using the E802 lead-glass and ZCAL. Preliminary $d\sigma/dE_T$, $dE_T/d\eta$ and $d\sigma dT_{ZCAL}$ spectra are presented, and the shapes of the spectra from different systems are compared. The transverse and forward energies in Au+Au are observed to be anticorrelated in a manner that is reproduced by the cascade model ARC but not by the essentially geometric model Fritiof.

25088 (BNL–48588) **Baryon spectra in Au + Au collisions: Preliminary results from E-866.** Gonin, M. The E-802/E-866 Collaboration. Brookhaven National Lab., Upton, NY (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States); US-Japan High Energy Physics Collaboration. DOE Contract AC02-76CH00016 ;W-31109-ENG-38 ;AC03-76SF00098 ;W-7405-ENG-48. (CONF-921122–50: Meeting of the Division of Particles and Fields of the American Physical Society, Batavia, IL (United States), 10-14 Nov 1992). Order Number DE93010878. Source: OSTI; NTIS; INIS; GPO Dep.

Measurements are presented of single particle spectra from Au targets using the recently commissioned Au-beam at 11.6 GeV/c per nucleon from the BNL Tandem-Booster-AGS accelerator facilities. Protons and deuterons were detected with the measuring the 25msr E-802 spectrometer. Collision centrality was determined by measuring the forward energy in a calorimeter subtending a 1.2° cone about 0°. Some comparisons with the cascade code ARC have been made.

25089 (BNL–48594) **Production of strange clusters in relativistic heavy ion collisions.** Dover, C.B.; Baltz, A.J.; Pang, Yang; Schlagel, T.J.; Kahana, S.H. Brookhaven National Lab., Upton, NY (United States). Feb 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930173–5: HIPAGS meeting, Cambridge, MA (United States), 14-17 Jan 1993). Order Number DE93010876. Source: OSTI; NTIS; INIS; GPO Dep.

We address a number of issues related to the production of strangeness in high energy heavy ion collisions, including the possibility that stable states of multi-strange hyperonic or quark matter might exist, and the prospects that such objects may be created and detected in the laboratory. We make use of events generated by the cascade code ARC to estimate the rapidity distribution dN/dy of strange clusters produced in Si+Au and Au+Au collisions at AGS energies. These calculations are performed in a simple coalescence model, which yields a consistent description of the strange cluster (d, ^{3}HE, ^{3}H, ^{4}He) production at these energies. If a doubly strange, weakly bound $\Lambda\Lambda$ dibaryon exists, we find that it is produced rather copiously in Au+Au collisions, with dN/dy $\sim$0.1 at raid-rapidity. If one adds another non-strange or strange baryon to a cluster, the production rate decreases by roughly one or two orders of magnitude, respectively. For instance, we predict that the hypernucleus $_{\Lambda\Lambda}{}^{6}$He should have dN/dy $\sim 5 \times 10^{-6}$ for Au+Au central collisions. It should be possible to measure the successive $\Lambda \rightarrow p\pi-$ weak decays of this object. We comment on the possibility that conventional multi-strange hypernuclei may serve as "doorway states" for the production of stable configurations of strange quark matter, if such states exist.

25090 (BNL–48634) **Meson production from the E-802 and E-866 experiments at the AGS.** Gonin, M. E-802 Collaboration. Brookhaven National Lab., Upton, NY (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States); US-Japan High Energy Physics Collaboration. DOE Contract AC02-76CH00016 ;W-31109-ENG-38 ;AC03-76SF00098 ;W-7405-ENG-48. (CONF-930173–4: HIPAGS meeting, Cambridge, MA (United States), 14-17 Jan 1993). Order Number DE93010875. Source: OSTI; NTIS; INIS; GPO Dep.

Preliminary results from E-802 (Si-beam) and B-866 (Au-beam) are presented for central collisions. Meson production (π's and K's) in heavy ion collisions are discussed from light systems (A = 55) to

heavy systems (A = 394). Comparisons with predictions of the cascade code ARC are carried out. The balance of energy and momentum is considered for the Au+Au data.

25091 (BNL–48649) **Neutral strange particle production at the AGS.** Saulys, A.C. For the E810 Collaboration. Brookhaven National Lab., Upton, NY (United States). 11 Feb 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016 ;FG02-91ER40645 ;FG02-88ER40413 ;FG05-87ER40309. (CONF-930173–9: HIPAGS meeting, Cambridge, MA (United States), 14-17 Jan 1993). Order Number DE93014044. Source: OSTI; NTIS; INIS; GPO Dep.

We present the results of Λ and K_s^o production from Si and Pb targets with 14.6×Λ Gev/c Si beams. The measured rapidity distributions and the transverse mass exponential slopes are presented and compared with models.

25092 (CONF-9211199–6) **Theoretical study of fission dynamics with muons.** Oberacker, V.E. (Vanderbilt Univ., Nashville, TN (United States). Dept. of Physics and Astronomy); Umar, A.S.; Wells, J.C.; Bottcher, C.; Strayer, M.R.; Maruhn, J.A. Oak Ridge National Lab., TN (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Symposium on nuclear physics of our times; Sanibel Island, FL (United States); 17-21 Nov 1992. Order Number DE93012761. Source: OSTI; NTIS; INIS; GPO Dep.

Following muon capture by actinide atoms, some of the inner shell muonic transitions proceed by inverse internal conversion, i.e. the excitation energy of the muonic atom is transferred to the nucleus. In particular, the muonic E2:(3d→1s) transition energy is close to the peak of the isoscalar giant quadrupole resonance in actinide nuclei which exhibits a large fission width. Prompt fission in the presence of a bound muon allows us to study the dynamics of large-amplitude collective motion. We solve the time-dependent Dirac equation for the muonic spinor wave function in the Coulomb field of the fissioning nucleus on a 3-dimensional lattice and demonstrate that the muon attachment probability to the light fission fragment is a measure of the nuclear energy dissipation between the outer fission barrier and the scission point.

25093 (CONF-930197–3) **Formation and decay of toroidal and bubble nuclei and the nuclear equation of state.** Xu, H.M. (Texas A and M Univ., College Station, TX (United States). Cyclotron Inst.); Gagliardi, C.A.; Natowitz, J.B.; Tribble, R.E.; Wong, C.Y.; Lynch, W.G. Oak Ridge National Lab., TN (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States); Welch (Robert A.) Foundation, Houston, TX (United States). DOE Contract AC05-84OR21400 ;FG05-86ER40256. Grant PHY-89-13815. From 9. winter workshop on nuclear dynamics; Key West, FL (United States); 30 Jan - 6 feb 1993. Order Number DE93011848. Source: OSTI; NTIS; INIS; GPO Dep.

Multifragmentation, following the formation of toroidal and bubble nuclei, is observed with an improved Boltzmann-Uehling-Uhlenbeck (BUU) model for central ^{92}Mo + ^{92}Mo collisions. Guided by our BUU model, we propose two signatures: (1) because of the geometries of bubbles and toroids and because of the cold breakup at low temperatures, we predict enhanced cross sections for fragments with nearly-equal masses at small center-of-mass energies. (2) the coplanarity of these nearly-equal fragments could carry important information concerning the geometry of the sources. This in turn, could provide information about the stiffness of the equation of state.

25094 (CONF-9301109–1) **Measurements of transverse energy and forward energy in high-energy nuclear collisions.** Sorensen, S.P. (Tennessee Univ., Knoxville, TN (United States). Dept. of Physics). Oak Ridge National Lab., TN (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 2. international conference on physics and astrophysics of quark-gluon plasma; Calcutta (India); 19-23 Jan 1993. Order Number DE93012755. Source: OSTI; NTIS; INIS; GPO Dep.

The experimental data on forward energy and transverse energy production in high energy nuclear collisions at the AGS and SPS accelerators are reviewed.

25095 (CRN–92-32) **Putting in evidence the asymmetric fission in the desexcitation process of ^{47}V nuclei.** Djerroud, B. (Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires). Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires. Jun 1992. [180p.] (In French). Order Number DE93626932. Source: OSTI; NTIS (US Sales Only); INIS.

The fusion-fission, which reflects the instability of the nuclei against the deformation and leads to a binary break up into nearly equal mass nuclei, have been considered as a general feature of the heavy ions (A>80). For lighter systems the fission decay of the compound nucleus is predicted by the rotating liquid drop model to be minor process and the fully-damped products observed in reactions between light heavy ions (A<43) have been explained by an orbiting process for which the equilibration of the dinuclear system is not fully accomplished. In the present work, the properties of the fully-damped binary fragments have been investigated in the ^{35} Cl+^{12} C, ^{31} P+^{16} O and ^{23} Na+^{24} Mg reactions used in order to populate the ^{47} V system at two excitation energies E = 59 and 64 MeV. This study shows that these fragments are the result of the emission from a source and their elemental distributions are asymmetric independently to the entrance channel asymmetry. The absence of entrance channel effect is a signature of the asymmetric fission process of the ^{47} V nucleus. The comparison of the experimental observations to the statistical model shows that the fission barriers in this mass region are lower than those predicted by the rotating liquid drop model and the need of introducing their angular momentum and mass asymmetry dependence is clearly shown. In conclusion, it is well established that the evidence of the asymmetric fission break up into the desexcitation process of the ^{47} V nucleus should be taken into account in the statistical calculations describing the complete fusion of light heavy ions.

25096 (CRN–92-51) **Angular momentum distributions for ^{16}O + ^{144}Nd.** Duchene, G. (Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires); Romain, P.; Beck, F.A.; Benet, P.; Disdier, D.; Haas, B.; Lott, B.; Rauch, V.; Scheibling, F.; Vivien, J.P.; Basu, S.K.; Bozek, E.; Zuber, K.; Di Gregorio, D.E. Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires. 1992. [45p.] Order Number DE93626899. Source: OSTI; NTIS (US Sales Only); INIS.

Fusion cross sections have been measured for the system ^{16} O + ^{144} Nd at bombarding energies in the range 67 MeV $\leq E_{lab} \leq$ 90 MeV by detecting directly evaporation residues in Si detectors and in the range 60 MeV $\leq E_{lab} \leq$ 75 MeV by off-line detection of the K X-rays emitted by the radioactive evaporation residues and daughters. In order to obtain the spin distributions in the compound system gamma-ray multiplicity distributions for the most important neutron evaporation channels were also measured using a 4π - BaF_2 array, in conjunction with Ge detectors. Results are compared with calculations based on models that consider fluctuations in barrier height due to ground state zero point vibrations as well as couplings to various inelastic and transfer channels.

25097 (DOE/ER/40293–7) **Nuclear structure studies via neutron interactions: Progress report, 1 July 1992–30 June 1993.** Carlton, R.F. Middle Tennessee State Univ., Murfreesboro, TN (United States). Dept. of Chemistry and Physics. Mar 1993. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-86ER40293. Order Number DE93013868. Source: OSTI; NTIS; INIS; GPO Dep.

Comparison has been made between the empirical integrated strengths and external R-functions and the predictions of a dispersive optical model for the n-^{208}Pb system, for partial waves through $f_{7/2}$. Parameters of a constant geometry model give a fair representation of the experimental results. A hint of the need for a parity dependence in one of the model parameters is seen in the two data and in thetotal cross section in the low-energy region. Other research performed consisted of: (1) refinement of the resonance analysis of the n-^{208}Pb system, resulting in more definitive J^{π} assignments and external R-functions consistent over the neutron energy range [80–1760 keV]; (2) background correction and processing of n-^{86}Sr differential scattering cross section data for use with total cross section data for R-matrix analysis (3) measurement of the n-^{90}Zr differential scattering cross section at the 200-m flight path of the ORELA.

25098 (DOE/ER/40321–8) **Mass and charge distributions in chlorine-induced nuclear reactions.** Marchetti, A.A. Maryland Univ., College Park, MD (United States). Dept. of Chemistry and Biochemistry. 1991. 227p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-87ER40321. Order Number DE93013383. Source: OSTI; NTIS; INIS; GPO Dep.

Projectile-like fragments were detected and characterized in terms of A, Z, and energy for the reactions ^{37}Cl on ^{40}Ca and ^{209}Bi at E/A = 7.3 MeV, and ^{35}Cl, on ^{209}Bi at E/A = 15 MeV, at angles close to the grazing angle. Mass and charge distributions were generated in the N-Z plane as a function of energy loss, and have been parameterized in terms of their centroids, variances, and coefficients of correlation. Due to experimental problems, the mass resolution corresponding to the ^{31}Cl on ^{209}Bi reaction was very poor. This prompted the study and application of a deconvolution technique for peak enhancement. The drifts of the charge and mass centroids for the system ^{37}Cl on ^{40}Ca are consistent with a process of mass and charge equilibration mediated by nucleon exchange between the two partners, followed by evaporation. The asymmetric systems show a strong drift towards larger asymmetry, with the production of neutron-rich nuclei. It was concluded that this is indicative of a net transfer of protons from the light to the heavy partner, and a net flow of neutrons in the opposite direction. The variances for all systems increase with energy loss, as it would be expected from a nucleon exchange mechanism; however, the variances for the reaction ^{37}Cl on ^{40}Ca are higher than those expected from that mechanism. The coefficients of correlation indicate that the transfer of nucleons between projectile and target is correlated. The results were compared to the predictions of two current models based on a stochastic nucleon exchange mechanism. In general, the comparisons between experimental and predicted variances support this mechanism; however, the need for more realistic driving forces in the model calculations is indicated by the disagreement between predicted and experimental centroids.

25099 (DOE/ER/40321–10) **The decay of hot nuclei formed in La-induced reactions at E/A=45 MeV.** Libby, B. Maryland Univ., College Park, MD (United States). Dept. of Chemistry and Biochemistry. 1993. 307p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-87ER40321. Order Number DE93013384. Source: OSTI; NTIS; INIS; GPO Dep.

The decay of hot nuclei formed in the reactions ^{139}La + ^{27}Al, ^{51}V, ^{nat}Cu, and ^{139}La were studied by the coincident detection of up to four complex fragments (Z > 3) emitted in these reactions. Fragments were characterized as to their atomic number, energy and in- and out-of-plane angles. The probability of the decay by an event of a given complex fragment multiplicity as a function of excitation energy per nucleon of the source is nearly independent of the system studied. Additionally, there is no large increase in the proportion of multiple fragment events as the excitation energy of the source increases past 5 MeV/nucleon. This is at odds with many prompt multifragmentation models of nuclear decay. The reactions ^{139}La + ^{27}Al, ^{51}V, ^{nat}Cu were also studied by combining a dynamical model calculation that simulates the early stages of nuclear reactions with a statistical model calculation for the latter stages of the reactions. For the reaction ^{139}La + ^{27}Al, these calculations reproduced many of the experimental features, but other features were not reproduced. For the reaction ^{139}La + ^{51}V, the calculation failed to reproduce somewhat more of the experimental features. The calculation failed to reproduce any of the experimental features of the reaction ^{139}La + ^{nat}Cu, with the exception of the source velocity distributions.

25100 (DOE/ER/40321–11) **Mass and charge distributions in iron-induced reactions and excitation energy division between the fragments of the 672-MeV ^{56}Fe + ^{165}Ho reaction.** Madani, H. Maryland Univ., College Park, MD (United States). Dept. of Chemistry. 1993. 219p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-87ER40321. Order Number DE93013385. Source: OSTI; NTIS; INIS; GPO Dep.

The projectile-like and target-like fragments produced by the 12-MeV/nucleon ^{56}Fe + ^{165}Ho reaction were detected in coincidence. The measured parameters were the mass, charge, kinetic energy scattering angle of the projectile-like fragments, and the scattering angle of the target-like fragments. The mass and charge distributions of the projectile-like fragments were generated as a function of energy loss, and characterized by their centroids, variances, and correlation coefficients. The neutron drift of the measured projectile-like products is mostly due to evaporative processes, while the charge drift is a result of a net transfer of protons from the projectile-like fragment to the target-like fragment. The result is a weak drift of the system towards mass asymmetry. The predictions of two nucleon exchange models are compared to the experimental results of the 672-MeV ^{56}Fe + ^{165}Ho reaction and other Fe-induced reactions. The fairly good agreement between the experimental and theoretical variances verifies the prevalence of a nucleon exchange mechanism in these reactions. The information from the coincidence measurement and two-body kinematics are used to reconstruct the pre-evaporation masses of the projectile-like and target-like fragments of the reaction. Statistical evaporation calculations are used to translate these masses into excitation energies of the primary fragments. The ratio of excitation energy stored in the projectile-Mm fragment decreases with increasing energy loss, in qualitative agreement with previous measurements; however, higher ratios are observed for the 672-MeV ^{56}Fe on ^{165}Ho system.

25101 (DOE/ER/40561–080) **Nuclear astrophysics.** Haxton, W.C. Washington Univ., Seattle, WA (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract FG06-90ER40561. Grant NAGW 2523. (CONF-920708–7: 2. international nuclear physics conference, Wiesbaden (Germany), 26 Jul - 1 aug 1992). Order Number DE93010569. Source: OSTI; NTIS; INIS; GPO Dep.

The problem of core-collapse supernovae is used to illustrate the many connections between nuclear astrophysics and the problems nuclear physicists study in terrestrial laboratories. Efforts to better understand the collapse and mantle ejection are also motivated by a variety of interdisciplinary issues in nuclear, particle, and astrophysics, including galactic chemical evolution, neutrino masses and mixing, and stellar cooling by the emission of new particles. The current status of theory and observations is summarized.

25102 (DOE/ER/40637–6) **[Relativistic heavy-ion collisions]: Annual report.** Hwa, R.C. Oregon Univ., Eugene, OR (United States). [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-91ER40637. Order Number DE93014844. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the following topics: quark-hadron phase transition; hadron production without phase transition; fractal structure in multiparticle production; and j/psi suppression in pA collisions. (LIP)

25103 (ECN-RX–92-064) **Status of statistical model capture calculations.** Kopecky, J. (Netherlands Energy Research Foundation (ECN), Petten (Netherlands)); Uhl, M. Netherlands Energy Research Foundation (ECN), Petten (Netherlands). Oct 1992. [8p.] (CONF-921046–: Symposium on nuclear data evaluation methodology, Upton, NY (United States), 12-16 Oct 1992). Order Number DE93626881. Source: OSTI; NTIS; INIS.

The most important input parameters in statistical model neutron capture calculations are γ-ray strength functions and level densities. Several models have been considered for these quantities and their influence on the calculated total radiative width, capture cross sections and γ-ray spectra was studied. About 70 targets ($90<A<250$) have been used in these calculations with the emphasis on the behaviour of targets from the deformed region. (author). 25 refs., 3 figs.

25104 (GANIL-P–93-03) **Inclusive excitation-energy distributions of hot nuclei from 44 MeV/nucleon Ar- and 32 MeV/nucleon Kr-induced reactions.** Duchene, G. (Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires); Lott, B.; Frehaut, J.; Patin, Y.; Pranal, Y.; Uzureau, J.L.; Charvet, J.L. Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). 1993. [27p.] Order Number DE93626900. Source: OSTI; NTIS (US Sales Only); INIS.

Inclusive neutron multiplicity distributions were measured by means of 4 π liquid-scintillator detectors for Ar and Kr-induced reactions at 44 MeV/nucleon and 32 MeV/nucleon, respectively. For

all the systems studied, the observed distributions exhibit a bump structure at large multiplicity corresponding to highly dissipative collisions. For Ar-induced reactions, the excitation energies necessary to explain the most probable neutron multiplicity associated with these dissipative collisions are estimated, the correspondence between excitation energy and neutron multiplicity being calculated in the framework of the statistical model. The so-obtained values of excitation energies, which are systematically lower than those predicted using the massive-transfer picture, are discussed.

25105 (INDC(NDS)–204/GSp, pp. 111-112) **Data on charged-particle-induced reactions: Some problems.** Chukreev, F.E. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Inst. Atomnoj Ehnergii). International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Apr 1988. Translated from Russian. (CONF-871026–: IAEA Data Networking meeting, Upton, NY (United States), 26-30 Oct 1987). In *Report on the 9. IAEA consultants' meeting of the nuclear reaction data centres: Including the 20. four-centres meeting of the neutron data centres and the 10. meeting on charged particle nuclear data compilation.* [152p.] Order Number DE93626597. Source: OSTI; NTIS (US Sales Only); INIS.

The report shortly presents some of the difficult problems which should be solved by the Atomic and Nuclear Data Centre of the USSR State Committee on the Utilization of Atomic Energy in the nuclear reaction data compilation for the production of radionuclides of medical interest. 2 refs.

Source: OSTI; NTIS (US Sales Only); INIS.

The report is a review of the work carried out by the Centre for Experimental Photonuclear Data (CDFE), Moscow, mainly the computer processing of data in the EXFOR format and the evaluation of photonuclear data.

25108 (INDC(NDS)–205/GSp) **Measurement and analysis of double-differential neutron emission spectra in (P,N) and (α,N) reactions: Summary report.** Okamoto, K. (International Atomic Energy Agency, Vienna (Austria). Nuclear Data Section); Mehta, M.K. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. May 1988. [13p.] (CONF-8802182–: 2. research co-ordination meeting on measurement and analysis of double-differential neutron emission spectra in (P,N) and (α,N) reactions, Vienna (Austria), 8-10 Feb 1988). Order Number DE93626882. Source: OSTI; NTIS (US Sales Only); INIS.

The second IAEA Research Co-ordination Meeting on Measurement and Analysis of Double-Differential Neutron Emission Spectra in (p,n) and (α,n) Reactions was convened by the IAEA Nuclear Data Section at the IAEA Headquarters in Vienna during 8-10 February, 1988. The main objectives of the Co-ordinated Research Project for which this meeting was held are (i) to extract systematic information about nuclear level densities as a function of excitation energy by analysing the neutron emission spectra from (p,n) and (α,n) reactions on properly selected targets and bombarding energy range, and (ii) to parametrize this information into appropriate phenomenological models to enable reliable extrapolation for general use of level density information in basic and applied nuclear physics related problems. Detailed conclusions and recommendations, together with a summary of the programme during 1988/1989 are attached in the Appendices.

25109 (INDC(NDS)–213/GM3, pp. 15-21) **Studies of the effect of the properties of neutron producing targets and sample backings on neutron cross section measurements.** Wasson, O.A. In *The influence of target and sample properties on nuclear data measurements: Summary report of the IAEA advisory group meeting in co-operation with the International Nuclear Target Development Society (INTDS), held in Darmstadt, Germany, 5-9 September 1988.* [74p.] Order Number DE93626092. Source: OSTI; NTIS (US Sales Only); INIS.

The use of pulsed-beam time-of-flight techniques to monitor the time dependence of the distribution of the neutron energy spectrum from lithium metal targets produced from the $^{7}Li(p,n)^{7}Be$ reaction is reviewed. The effect on the 14-MeV neutron angular distribution produced by the $T(d,n)^{4}He$ reaction by changes in the tritium distribution in the TiT target is investigated. The influence of the crystalline properties of sample backings and the use of x-ray powder diffraction to determine the stoichiometry of uranium oxide material are studied. (author). 4 refs, 7 figs.

25110 (INDC(NDS)–213/GM3, pp. 67) **The influence of target impurities on the accuracy of reaction cross section measurements.** Cheng Xiaowu (Academia Sinica, Shanghai, SH (China). Shanghai Inst. of Nuclear Research). International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Oct 1988. (CONF-8809159–: 14. world conference of the International Nuclear Target Development Society (INTDS): heavy-ion targets and related phenomena, Darmstadt (Germany), 5-9 Sep 1988). In *The influence of target and sample properties on nuclear data measurements: Summary report of the IAEA advisory group meeting in co-operation with the International Nuclear Target Development Society (INTDS), held in Darmstadt, Germany, 5-9 September 1988.* [74p.] Order Number DE93626092. Source: OSTI; NTIS (US Sales Only); INIS.

Inelastic scattering of protons on Ni isotopes has been measured at 25 MeV incident energy. Special attention has been paid to the low energy part of the energy spectra to study the isotopic effect on preequilibrium emission. H, C, and O contaminations on targets have been analyzed by backscattering and nuclear reaction, both before and after the experiment. Methods used to minimize the contamination and to deduct its contribution to the energy spectra will be described. The influence of target impurities on the accuracy of reaction cross sections will be discussed. (author). Abstract only.

25111 (INDC(NDS)–213/GM3, pp. 68) **On the influence of sample and target properties on the results of energy-dependent cross section measurements.** Winkler, G. (Vienna Univ. (Austria). Inst. fuer Radiumforschung und Kernphysik). International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Oct 1988. (CONF-8809159–: 14. world conference of the International Nuclear Target Development Society (INTDS): heavy-ion targets and related phenomena, Darmstadt (Germany), 5-9 Sep 1988). In *The influence of target and sample properties on nuclear data measurements: Summary report of the IAEA advisory group meeting in co-operation with the International Nuclear Target Development Society (INTDS), held in Darmstadt, Germany, 5-9 September 1988.* [74p.] Order Number DE93626092. Source: OSTI; NTIS (US Sales Only); INIS.

The impact of sample and target properties on the accuracy of experimental nuclear cross section data is discussed in the context

of the basic requirements in order to obtain reliable results from the respective measurements from the user's point of view. Special emphasis is put on activation measurements with fast neutrons. Some examples are given and suggestions are made based on experiences and recent investigations by the author and his coworkers. (author). Abstract only.

In *The influence of target and sample properties on nuclear data measurements: Summary report of the IAEA advisory group meeting in co-operation with the International Nuclear Target Development Society (INTDS), held in Darmstadt, Germany, 5-9 September 1988.* [74p.] Order Number DE93626092. Source: OSTI; NTIS (US Sales Only); INIS.

Sample-related corrections for average neutron cross section measurements are often complicated in the keV region due to the resonance structure. In particular, corrections for neutron multiple-scattering and self-shielding for chemical compound samples of rare earth materials should be carefully made, because they are highly hygroscopic. A Monte-Carlo method has been developed by taking into account the effects caused by neutron slowing down into the resonance region due to the scattering from hydrogen and oxygen atoms. The validity of calculated results for corrections has been investigated by comparing experimental data of oxide samples with those of metallic samples. The calculation method and related problems will be discussed in detail. (author). Abstract only.

25113 (INDC(NDS)–213/GM3, pp. 71) **On the fast neutron spectra shape in the nuclear constant measurement experiments with an electrostatic accelerator.** Tikhonov, S.V. International Nuclear Data Committee. Oct 1988. (CONF-8809159–: 14. world conference of the International Nuclear Target Development Society (INTDS): heavy-ion targets and related phenomena, Darmstadt (Germany), 5-9 Sep 1988). In *The influence of target and sample properties on nuclear data measurements: Summary report of the IAEA advisory group meeting in co-operation with the International Nuclear Target Development Society (INTDS), held in Darmstadt, Germany, 5-9 September 1988.* [74p.] Order Number DE93626092. Source: OSTI; NTIS (US Sales Only); INIS.

Neutron producing reactions (1 keV < E_n < 19 MeV) have been investigated with respect to the neutron background production with the time-of-flight method employing pulsed proton or deuteron beams from the Van-de-Graaff accelerator. The largest fraction of background for the reaction $^{3}H(d,n)^{4}He$ results from a high impurity of deuterium in some solid Ti-T targets, whereas other background components can nearly fully be taken into account by a blank target measurement. Self target build-up was observed for an old Ti-D target, while for the $^{3}H(p,n)^{3}He$ reaction neutron scattering at the target construction, which could only partially be determined by backing thickness variation, was found to be a significant effect. The problems with LiF and metallic Li as target material for the $^{7}Li(p,n)^{7}Be$ reaction are discussed. In order to meet the desired resonance in the $^{45}Sc(p,n)^{45}Ti$ reaction, the energy of the protons has to be precisely determined by the time-of-flight method. (author). Abstract only.

25115 (INDC(NDS)–213/GM3, pp. 23-28) **Examples of problems caused by impurities in targets and/or research samples.** Adair, H.L. (Oak Ridge National Lab., Oak Ridge, TN (United States). (CONF-8809159–: 14. world conference of the International Nuclear Target Development Society (INTDS): heavy-ion targets and related phenomena, Darmstadt (Germany), 5-9 Sep 1988). In *The influence of target and sample properties on nuclear data measurements: Summary report of the IAEA advisory group meeting in co-operation with the International Nuclear Target Development Society (INTDS), held in Darmstadt, Germany, 5-9 September 1988.* [74p.] Order Number DE93626092. Source: OSTI; NTIS (US Sales Only); INIS.

It is important that the fabricators of research or production samples understand what problems impurities will cause. Thus, it is necessary that those individuals requesting targets or other samples discuss, in detail, what is required with the individuals responsible for preparing the samples. This will permit proper preparation procedures to be selected which will eliminate or reduce the impurity content that might otherwise jeopardize the intended use of the sample. Examples of problems caused by impurities in research and production samples are detailed. 2 refs, 4 figs, 1 tab.

25116 (INDC(NDS)–213/GM3, pp. 65) **The target for heavy ion physics.** Gono, Y. (Institute of Physical and Chemical Research, Wako, Saitama (Japan)); Ishihara, M. Source: OSTI; NTIS (US Sales Only); INIS.

We are engaged in researches on nuclear and atomic physics using heavy ion accelerators such as Linac, Tandem Van de Graaff, separate-sector cyclotron. Beam energies covered ranges from a few MeV/u to 100 MeV/u. The requirements for target properties widely vary with the individual research chosen and the type of beam used. Typical problems are concerned with thickness uniformity, heat tolerance, target preparation of non-metallic elements, density of gaseous target and so on. In this report we illustrate several specific examples of such problems encountered in current experiments. (author). Abstract only.

25117 (INDC(NDS)–213/GM3, pp. 66) **On the importance of target parameters in heavy ion positron spectroscopy.** Bokemeyer, H. (Gesellschaft fuer Schwerionenforschung mbH, Darmstadt (Germany)). (CONF-8809159–: 14. world conference of the International Nuclear Target Development Society (INTDS): heavy-ion targets and related phenomena, Darmstadt (Germany), 5-9 Sep 1988). In *The influence of target and sample properties on nuclear data measurements: Summary report of the IAEA advisory group meeting in co-operation with the International Nuclear Target Development Society (INTDS), held in Darmstadt, Germany, 5-9 September 1988.* [74p.] Order Number DE93626092. Source: OSTI; NTIS (US Sales Only); INIS.

Details of the target constitution may represent important ingredients to the feasibility of heavy ion experiments. The central role of

such target characteristics will be exemplified using experiments on positron spectroscopy and related fields pursued with heavy ion beams of the GSI UNILAC-machine in Darmstadt. The scope includes the influence of the target compounds on both the basic physics and the background, the use of radioactive targets, the influence on ionic charge distributions, and the use of the stopping behaviour of the heavy ions for the measurement of the beam energy and the life-time discrimination by means of kinematic shifts. Targets bombarded by heavy ion beams suffer considerable deterioration. Thus the use of special techniques became important for the on- and off-line control of critical target parameters and will be introduced here. (author). Abstract only.

Source: OSTI; NTIS (US Sales Only); INIS.

Target characteristics required to carry out reliable thermal neutron induced fission studies on ^{243}Am are discussed. Especially the problems caused by the ingrowth of ^{239}Pu in the material are examined, and purification of the ^{243}Am base material is studied. The purification was carried out by anion exchange on Dowex-1 in HNO_3 medium, followed by cation exchange on Dowex-50 to eliminate iron introduced in the first purification step, and precipitation by NH_4OH to eliminate sodium. The material was then transformed into americium acetate and two targets were prepared by electrospraying. The targets were used for the study of the reaction characteristics and for the determination of the thermal neutron induced fission cross section. (author). Abstract only.

25120 (INDC(NDS)–256/S) **Status of thorium cycle nuclear data evaluations: Comparison of cross-section line shapes of JENDL-3 and ENDF-B-VI files for ^{230}Th, ^{232}Th, ^{231}Pa, ^{233}Pa, ^{232}U, ^{233}U and ^{234}U.** Ganesan, S. (International Atomic Energy Agency, Vienna (Austria). Nuclear Data Section); McLaughlin, P.K. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Feb 1992. [138p.] Order Number DE93626883. Source: OSTI; NTIS (US Sales Only); INIS.

Since 1990, one of the most interesting developments in the field of nuclear data for nuclear technology applications is that several new evaluated data files have been finalized and made available to the International Atomic Energy Agency (IAEA) for distribution to its Member States. Improved evaluated nuclear data libraries such as ENDF/B-VI from the United States and JENDL-3 from Japan were developed over a period of 10-15 years. This report is not an evaluation of the evaluations. The report as presented here gives a first look at the cross section line shapes of the isotopes that are important to the thorium fuel cycle derived from the two recently evaluated data files: JENDL-3 and ENDF/B-VI. The basic evaluated data files JENDL-3 and ENDF/B-VI were point-processed successfully using the codes LINEAR and RECENT. The point data were multigrouped in three different group structures using the GROUPIE code. Graphs of intercomparisons of cross section line shapes of JENDL-3 and ENDF/B-VI are presented in this paper for the following isotopes of major interest to studies of the thorium fuel cycle: ^{230}Th, ^{232}Th, ^{231}Pa, ^{233}Pa, ^{232}U, ^{233}U and ^{234}U. Comparisons between JENDL-3 and ENDF/B-VI which were performed at the point and group levels show large discrepancies in various cross sections. We conclude this report with a general remark that it is necessary to perform sensitivity studies to assess the impacts of the discrepancies between the two different sets of data on calculated reactor design and safety parameters of specific reactor systems and, based on the results of such sensitivity studies, to undertake new tasks of evaluations. (author). 2 refs, 245 figs, 8 tabs.

The importance of intermediate energy nuclear data for technical applications is widely accepted. The key issue in this field is the correct Monte-Carlo calculation for target design of space- and energy distributions of various particles when it is irradiated by the primary beam. The 'inclusive' and 'exclusive' approaches which are usually considered are discussed here. 13 refs, 3 figs.

25124 (INDC(NDS)–263/GSp) **Activation cross sections for the generation of long-lived radionuclides of importance in fusion reactor technology: Texts of papers presented at the 1. meeting of a co-ordinated research programme held in Vienna, 11-12 November 1991.** Wang Dahai (comp.) (International Atomic Energy Agency, Vienna (Austria). Nuclear Data Section). International Atomic Energy Agency, Vienna (Austria). International

Nuclear Data Committee. Jul 1992. [159p.] (CONF-9111146–: 1. research co-ordination meeting on activation cross-sections for the generation of long-lived radionuclides of importance in fusion reactor technology, Vienna (Austria), 11-12 Nov 1991). Order Number DE93626884. Source: OSTI; NTIS (US Sales Only); INIS.

Following the recommendations of the International Nuclear Data Committee (INDC), the IAEA Nuclear Data Section has established a Co-ordinated Research Programme (CRP) on activation cross sections for the generation of long-lived radionuclides of importance in concentrating on the cross sections for the reactions suggested by the 16th INDC meeting. The first Research Co-ordination Meeting of the CRP was held at the IAEA Headquarters, Vienna, Austria, from 11 to 12 November 1991. The main objectives of the meeting were to review the results under the CRP and the status of long-lived activation cross section data and to fix the future working programme for the CRP. The proceedings contain the progress reports of the CRP and 12 contributed papers presented at the meeting as well as the summary of the conclusions and recommendations of the meeting. Refs, figs and tabs.

25125 (INDC(NDS)–263/GSp, pp. 17-20) **Activation cross section measurement and evaluation for the ^{23}Na(n,2n)^{22}Na reaction.** Lu Hanlin (Academia Sinica, Beijing, BJ (China). Inst. of Atomic Energy); Zhao Wenrong; Yu Weixiang. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jul 1992. (CONF-9111146–: 1. research co-ordination meeting on activation cross-sections for the generation of long-lived radionuclides of importance in fusion reactor technology, Vienna (Austria), 11-12 Nov 1991). In *Activation cross sections for the generation of long-lived radionuclides of importance in fusion reactor technology: Texts of papers presented at the 1. meeting of a co-ordinated research programme held in Vienna, 11-12 November 1991.* [159p.] Order Number DE93626884. Source: OSTI; NTIS (US Sales Only); INIS.

A large serious discrepancy exists in the published literatures and in two recent evaluations for the cross sections of ^{23}Na(n,2n)^{22}Na reaction. New experimental measurements have been performed in neutron energy range of 13-18 MeV by activation method for ^{23}Na(n,2n)^{22}Na reaction. Based on the new measurements and the trend of excitation function, the recommended data are given. (author). 16 refs, 2 figs, 2 tabs.

25126 (INDC(NDS)–263/GSp, pp. 21-26) **Activation cross section measurement for the ^{179}Hf(n,2n)^{178m2}Hf reaction.** Yu Weixiang (Academia Sinica, Beijing, BJ (China). Inst. of Atomic Energy); Lu Hanlin; Zhao Wenrong. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jul 1992. (CONF-9111146–: 1. research co-ordination meeting on activation cross-sections for the generation of long-lived radionuclides of importance in fusion reactor technology, Vienna (Austria), 11-12 Nov 1991). In *Activation cross sections for the generation of long-lived radionuclides of importance in fusion reactor technology: Texts of papers presented at the 1. meeting of a co-ordinated research programme held in Vienna, 11-12 November 1991.* [159p.] Order Number DE93626884. Source: OSTI; NTIS (US Sales Only); INIS.

As an important data for a fusion reactor there are not any experimental results for the cross section of the ^{179}Hf(n,2n)^{178m2}Hf reaction. So the cross section was measured in this work at neutron energy of 14 MeV. Meanwhile, we also gave the data for the cross section of the ^{180}Hf(n,2n)^{179m2}Hf reaction. (author). 5 refs, 4 figs, 5 tabs.

25127 (INDC(NDS)–263/GSp, pp. 27-29) **Measurement and analysis of ^{165}Ho(n,γ)^{166m}Ho reaction cross section.** Xia Yijun (Sichuan Univ., Chengdu, SC (China). Inst. of Nuclear Science and Technology); Wang Chunhao; Long Xianguan. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jul 1992. (CONF-9111146–: 1. research co-ordination meeting on activation cross-sections for the generation of long-lived radionuclides of importance in fusion reactor technology, Vienna (Austria), 11-12 Nov 1991). In *Activation cross sections for the generation of long-lived radionuclides of importance in fusion reactor technology: Texts of papers presented at the 1. meeting of a co-ordinated research programme held in Vienna, 11-12 November 1991.* [159p.] Order Number DE93626884. Source: OSTI; NTIS (US Sales Only); INIS.

The cross sections of the ^{165}Ho(n,γ)^{166m} Ho reaction have been studied in the energy range from 29 to 1100 kev, using Au as a standard. The upper limits of the reaction cross section in the energy region were estimated. The capture cross section of Ho to 1200 y isomeric state has been determined at 676 $\pm$ 114 kev neutron energy. The result is 2.9 $\pm$ 0.60 mb. (author). 2 refs, 2 tabs.

25128 (INDC(NDS)–263/GSp, pp. 31-32) **Excitation functions of ^{151}Eu(n,2n)^{150m}Eu and ^{159}Tb(n,2n)^{158}Tb reactions.** Qalm, S.M. (Forschungszentrum Juelich GmbH (Germany). In *Activation cross sections for the generation of long-lived radionuclides of importance in fusion reactor technology: Texts of papers presented at the 1. meeting of a co-ordinated research programme held in Vienna, 11-12 November 1991.* [159p.] Order Number DE93626884. Source: OSTI; NTIS (US Sales Only); INIS.

Activation cross sections have been measured for ^{109}Ag(n,2n)^{108m}Ag, ^{63}Cu(n,)α^{60}Co, ^{134}Ba(n,2n)^{133}Ba, ^{134}Ba(n,p)^{134}Cs and ^{137}Ba(n,p)^{137}Cs reactions at 14.5 MeV. Excitation functions of ^{58}Ni(n,p)^{58m,g}Co, ^{115}In(n,2n)^{114m,g}In and ^{115}In(n,n')^{115m}In dosimetry reactions were also measured in the 2.1 and 14.8 MeV interval. Results were compared with existing data and calculations using the STAPRE and EXIFON codes. Cross section curves were calculated around 14 MeV by the EXIFON code for a number of reactions resulting long-lived ($T_{1/2}$>10y) radionuclides. (author). 11 refs, 7 figs, 1 tab.

25130 (INDC(NDS)–263/GSp, pp. 41-52) **Measurements of long-lived activation cross sections at 14.7 MeV in the inter-laboratory collaboration with ANL/LANL/JAERI.** Ikeda, Yujiro. Source: OSTI; NTIS (US Sales Only); INIS.

Six long-lived activation cross sections at 14.7 MeV have been measured by using the FNS facility in order to provide experimental data meeting the requirement in the radioactive wastes disposal assessment in the D-T fusion reactor. The measurements were conducted under an inter-laboratory collaboration with ANL/LANL/JAERI. Measured data were compared with data available in the

literature and discussed in terms of accuracy needed for the requirement. (author). 11 refs, 5 figs, 5 tabs.

25131 (INDC(NDS)–263/GSp, pp. 53-69) **Measured fast-neutron activation cross sections of Ag, Cu, Eu, Fe, Hf, Ni, Tb and Ti at 10.3 and 14.8 MeV and for the continuum neutron spectrum produced by 7-MeV deuterons on a thick Be-metal target.** Meadows, J.W. Source: OSTI; NTIS (US Sales Only); INIS.

Four identical sample packets containing elemental Ag, Cu, Eu, Fe, Hf, Ni, Tb and Ti have been irradiated in three distinct accelerator neutron fields, at Argonne National Laboratory and Los Alamos National Laboratory, U.S.A., and Japan Atomic Energy Research Institute, Tokai, Japan, under the auspices of an International Atomic Energy Agency Coordinated Research Program to investigate the production of long-lived radionuclides for fusion waste disposal applications. Final experimental results are presented here for 13 distinct reactions which ultimately lead to production of the following activities: Ag-106m,108m; Co-60g; Cr-51; Eu-150g,-152g; Hf-175,-179m2; Mn-54; Sc-46g,-47,-48; Tb-158g. The neutron fluence standard used was Ni-58(n,p)Co-58. The measured data include differential cross section values at 10.3 and 14.8 MeV, and integral cross sections for the continuum neutron spectrum produced by 7-MeV deuterons incident on a thick Be-metal target. The U-238(n,f) cross section was also measured at 10.3 MeV as a consistency check on the experimental technique. Some of the results of this study are compared with corresponding values from earlier work at Argonne and from ENDF/B-VI. (author). Refs, 1 fig., 9 tabs.

25132 (INDC(NDS)–263/GSp, pp. 71-84) **Consistent activation cross section calculations for all stable isotopes of V, Cr, Mn, Fe, Co, Ni.** Avrigeanu, M. (Central Inst. of Physics, Bucharest (Romania). Inst. of Physics and Nuclear Engineering); Ivascu, M.; Avrigeanu, V. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jul 1992. Contract IAEA-R-3802/R4/RB. (CONF-9111146–: 1. research co-ordination meeting on activation cross-sections for the generation of long-lived radionuclides of importance in fusion reactor technology, Vienna (Austria), 11-12 Nov 1991). In *Activation cross sections for the generation of long-lived radionuclides of importance in fusion reactor technology: Texts of papers presented at the 1. meeting of a co-ordinated research programme held in Vienna, 11-12 November 1991.* [159p.] Order Number DE93626884. Source: OSTI; NTIS (US Sales Only); INIS.

Comparison of the available experimental fast neutron reaction excitation functions on all stable isotopes of the elements V, Cr, Mn, Fe, Co, and Ni with nuclear model calculations is presented. Neutron and charged-particle emission spectra have also been analyzed in order to validate the pre-equilibrium emission model calculations (with no free internal parameters). The trial procedure involved provides confidence in the nuclear-model parameter basis used and makes possible calculations of increased accuracy for activation cross sections in this mass range, required for applications. (author). 13 refs, 27 figs.

25133 (INDC(NDS)–263/GSp, pp. 85-102) **Calculations of long-lived isomer production in neutron reactions.** Chadwick, M.B. (Los Alamos National Lab., Los Alamos, NM (United States). Theoretical Div.); Young, P.G. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jul 1992. (CONF-9111146–: 1. research co-ordination meeting on activation cross-sections for the generation of long-lived radionuclides of importance in fusion reactor technology, Vienna (Austria), 11-12 Nov 1991). In *Activation cross sections for the generation of long-lived radionuclides of importance in fusion reactor technology: Texts of papers presented at the 1. meeting of a co-ordinated research programme held in Vienna, 11-12 November 1991.* [159p.] Order Number DE93626884. Source: OSTI; NTIS (US Sales Only); INIS.

We present theoretical calculations for the production of the long-lived isomers ^{93m}Nb (1/2-, 16 yr), ^{121m}Sn (11/2-, 55 yr), ^{166m}Ho (7-, 1200 yr), ^{184m}Re (8+, 165 d), ^{186m}Re (8+, 2x10^5 yr), ^{178}Hf (16+, 31 yr), ^{179m}Hf (25/2-, 25 d), and ^{192m}Ir (9+, 241 yr), all of which pose potential radiation activation problems in nuclear fusion reactors if produced in 14-MeV neutron-induced reactions. We consider (n,2n), (n,n'), and (n,γ) production modes and compare our results both with experimental data (where available) and systematics. We also investigate the dependence of the isomeric cross section ratio on incident neutron energy for the isomers under consideration. The statistical Hauser-Feshbach plus preequilibrium code GNASH was used for the calculations. Where discrete state experimental information was lacking, rotational band members above the isomeric state, which can be justified theoretically but have not been experimentally resolved, were reconstructed. (author). 16 refs, 10 figs, 4 tabs.

25134 (INDC(NDS)–263/GSp, pp. 103-125) **Evaluation of isomeric excitation functions in neutron induced reactions.** Grudzevich, O.; Ignatyuk, A.; Zolotarev, K. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jul 1992. (CONF-9111146–: 1. research co-ordination meeting on activation cross-sections for the generation of long-lived radionuclides of importance in fusion reactor technology, Vienna (Austria), 11-12 Nov 1991). In *Activation cross sections for the generation of long-lived radionuclides of importance in fusion reactor technology: Texts of papers presented at the 1. meeting of a co-ordinated research programme held in Vienna, 11-12 November 1991.* [159p.] Order Number DE93626884. Source: OSTI; NTIS (US Sales Only); INIS.

The possibilities of isomer levels experimental excitation functions description with theoretical models are discussed. It is shown that the experimental data in many cases can be described by theoretical models quite well without parameter fitting. However, large discrepancies are observed for some reactions. In our opinion, these discrepancies are due to uncertainties of discrete level schemes, schemes of gamma-transitions between levels and spin dependence of level density. Small values of isomeric ratios (< 0.1) have been described with the largest errors. The simple formulae for energy dependence of isomeric ratio for (n,g) reaction has been proposed. (author). 53 refs, 10 figs, 8 tabs.

25135 (INDC(NDS)–263/GSp, pp. 127-142) **Implications of the IAEA CRP on long-lived activation cross sections on waste disposal and materials recycling for fusion reactor materials.** Cheng, E.T. (TSI Research Inc., Solana Beach, CA (United States)). International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jul 1992. (CONF-9111146–: 1. research co-ordination meeting on activation cross-sections for the generation of long-lived radionuclides of importance in fusion reactor technology, Vienna (Austria), 11-12 Nov 1991). In *Activation cross sections for the generation of long-lived radionuclides of importance in fusion reactor technology: Texts of papers presented at the 1. meeting of a co-ordinated research programme held in Vienna, 11-12 November 1991.* [159p.] Order Number DE93626884. Source: OSTI; NTIS (US Sales Only); INIS.

Waste disposal and materials recycling are important issues for the development of fusion power reactors. The recent criteria were summarized and discussed. The allowable concentrations of natural elements in the first wall and blanket components of a lithium self-cooled fusion blanket with vanadium structure, were assessed for the "Class C" shallow-land waste disposal consideration. The activation cross reactions recently developed under the IAEA Coordinated Research Program on Activation Cross Sections for the Generations of Long-Lived Radionuclides were incorporated to improve the REAC-2 library. Recommendations were given on measurements of some estimated cross sections: ^{158}Dy(n,p)^{158}Tb, ^{191}Ir(n,g)^{192m2}Ir, ^{180}Ta(n,t)^{178m2}Hf, ^{187}Re(n,2n)^{186m}Re and ^{185}Re(n,g)^{186m}Re. Another independent measurement on ^{179}Hf(n,2n)^{178m2}Hf was suggested. Measurements or estimates of transition cross sections for the long-lived radionuclides, namely

^{26}Al, ^{94}Nb, ^{108m}Ag, ^{158}Tb, ^{166m}Ho, ^{178m2}Hf, ^{186m}Re, and ^{192m2}Ir, were recommended for the investigation of long-term materials recycling issue. (author). 17 refs, 2 figs, 4 tabs.

25136 (INDC(NDS)–263/GSp, pp. 143-154) **Measurements of activation cross sections for some long-lived nuclides important in fusion reactor technology.** Blinov, M.V. (Radievyj Inst., Leningrad (Russian Federation)); Filatenkov, A.A.; Chuvaev, S.V. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jul 1992. (CONF-9111146–: 1. research co-ordination meeting on activation cross-sections for the generation of long-lived radionuclides of importance in fusion reactor technology, Vienna (Austria), 11-12 Nov 1991). In *Activation cross sections for the generation of long-lived radionuclides of importance in fusion reactor technology: Texts of papers presented at the 1. meeting of a co-ordinated research programme held in Vienna, 11-12 November 1991.* [159p.] Order Number DE93626884. Source: OSTI; NTIS (US Sales Only); INIS.

The Ag-109(n,2n)Ag-108m, Eu-151(n,2n)Eu-150 and Eu-153(n,2n)Eu-152 cross sections have been measured in the neutron energy interval of 13.7-14.9 MeV. The measurements were performed at the neutron generator NG-400 of the Radium Institute using (D-T) neutrons. At the same facility the upper limit has been obtained for the W-182(n,n'a)Hf-178m^2 cross section. Neutron capture of the Mo-98 that lead ultimately to the production of the long-lived Tc-99 has been studied at neutron energies 0.7-2.0 MeV. For these purposes, the Van de Graaf accelerator (EG-5) was employed that produced monochromatic neutrons in the (p-T) reaction. Both at EG-5 and NG-400 measurements, special efforts were made to minimize neutron spectrum impurities which unavoidably arise in irradiation environments. (author). 15 refs, 6 figs, 1 tab.

25137 (INDC(NDS)–265/G) **Total neutron cross-section of U-238 as measured with filtered neutrons of 55 keV and 144 keV.** Pham Zuy Hien (Dalat Nuclear Research Inst., Dalat (Viet Nam)); Vuong Huu Tan; Nguyen Phuoc Xuan. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Oct 1992. [11p.] Order Number DE93626885. Source: OSTI; NTIS (US Sales Only); INIS.

In the piercing horizontal channel of the Dalat nuclear research reactor a 98m long silicon filter has been installed for producing quasi-monoenergetic neutrons of 55 keV and 144 keV. The flux intensities of the neutron beams are $4x10^6$n/cm^2·s (55 keV) and $1.2x10^7$n/cm^2·s (144 keV). Filtered neutron beams are being utilized for the measurements of the resonance-averaged nuclear parameters. In the first experiments aiming partly at testing the adequacy of the experimental conditions total neutron cross-sections have been measured by transmission technique for U-238 and C-12 target nuclei. The data for U-238 obtained with the accuracy of about 1% were compared with the evaluated ENDF/B-IV data and the results of recent experimental works. (author). 6 refs, 4 figs.

25138 (IPNO-DRE–92-22) **Coulomb instability in collisions between very heavy nuclei around 30 MeV per nucleon.** Borderie, B. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire); Rivet, M.F.; Remaud, B.; Sebille, F. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. Jul 1992. [6p.] Order Number DE93626901. Source: OSTI; NTIS (US Sales Only); INIS.

Simulations based on the Landau-Vlasov model, of central collisions (b=0-3fm) between very heavy nuclei around 30 MeV per nucleon reveal the occurrence of Coulomb instability as already predicted by static calculations of hot nuclei a few years ago.

25139 (IPNO-DRE–92-32) **Odd-odd nuclei around A = 184.** Ibrahim, F. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire); Bourgeois, C.; Kilcher, P.; Korichi, A.; Le Blanc, F.; Oms, J.; Perrin, N.; Popescu, D.G.; Roussiere, B.; Sauvage, J.; Sergolle, H.; Hojman, D.; Davidson, J.; Davidson, M.; DebParis-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1992. [3p.] (CONF-920721–: 6. international conference on nuclei far from stability and 9th international conference on atomic masses and fundamental constants, Bernkastel-Kues (Germany), 19-24 Jul 1992). Order Number DE93626902. Source: OSTI; NTIS (US Sales Only); INIS.

An experiment has been performed in beam via the ^{165}Ho(^{24}Mg,5n)^{184}Au reaction using the 'Chateau de Cristal' multidetector in Orsay. We have identified in ^{184}Au some structures already observed in the neighboring odd-odd nuclei.

25140 (IPNO-DRE–92-35) **Study of the hot giant dipole resonance with the Medea detector.** Suomijaervi, T. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire); Le Faou, J.H.; Blumenfeld, Y.; Frascaria, N.; Garron, J.P.; Roynette, J.C.; Lamehi-Rachti, M.; Piattelli, P.; Agodi, C.; Alba, R.; Coniglione, R.; Del Zoppo, A.; FinocchiarParis-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1992. [10p.] (CONF-9209347–: 1. Joint Italian-Japanese meeting on perspectives in heavy ion physics, Catania (Italy), 29 Sep - 3 oct 1992). Order Number DE93626903. Source: OSTI; NTIS (US Sales Only); INIS.

The characteristics of the giant dipole resonance in hot nuclei formed by incomplete fusion of ^{36}Ar + ^{90}Zr at 27 MeV/u have been measured at GANIL with the MEDEA detector. This set up allows the simultaneous measurement of γrays, light charged particles, and fusion residues. Preliminary results indicate that the giant dipole resonance shows up prominently in coincidence with the incomplete fusion residues which have a mean excitation energy of 550 MeV. A comparison of the spectra with statistical calculations using the code CASCADE is presented.

25141 (IPNO-DRE–92-37) **Dissociation reactions of the ^{11}Be one-neutron halo: the interplay between structure and reaction mechanism.** Anne, R. (Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)); Lewitowicz, M.; Saint-Laurent, M.G.; Arnell, S.E.; Jonson, B.; Nilsson, T.; Nyman, G.; Wilhelmsen Rolander, K.; Bimbot, R.; Dogny, S.; Guillemaud-Mueller, D.; Mueller, A.C.;.Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1992. [9p.] Contract 06DA 184A. Order Number DE93626904. Source: OSTI; NTIS (US Sales Only); INIS.

Reactions of a radioactive ^{11} Be beam at 41 MeV/u have been investigated. The absolute magnitude of the differential cross-sections of the forward neutrons in the exclusive (^{10} Be + n) channel can be accounted for quantitatively in a simple model. The narrow distribution from high-Z targets turns out to arise from Coulomb dissociation whereas the broad distribution from the beryllium target is due to diffraction dissociation.

25142 (IPNO-T–92-03) **Study of induced reactions by a secondary beam of ^{11}Be in Be, Ti and Au targets.** Dogny, S. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 27 Oct 1992. [92p.] (In French). Order Number DE93626905. Source: OSTI; NTIS (US Sales Only); INIS.

In the last decade, new phenomena arised from nuclear reaction studies of neutron-rich light nuclei produced by projectile fragmentation. In this work, first we will recall briefly some aspects of these studies, in particular the two-neutron halo for nuclei whose binding energy of the two last neutrons is low. Secondly, we will describe the experiment which aims to study ^{11} Be reactions on Be, Ti and Be targets. The results of this experiment show the presence of a one-neutron halo, corresponding to a high dissociation cross-section for the three targets. We will show that three mechanisms, Coulomb dissociation for heavy targets, diffraction-and absorption-dissociation for light targets, account satisfactorily for reactions leading to ^{10} Be.

25143 (JINR–5-51-91, pp. 14-22) **Clusterization of secondary particles in cumulative hadron and nucleus-nucleus interactions.** Angelov, N.; Lyubimov, V.B.; Togoo, R. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1991. [64p.] (In Russian). In *JINR rapid communications: Collection.* Order Number DE93626358. Source: OSTI; NTIS (US Sales Only); INIS.

It is found that higher temperatures and other structures of fragmentating systems corerspond more to the clusters with cumulative hadrons than to the ones without hadrons. The investigations have been performed using the 2-m propane bubble chamber at the Laboratory of High Energies JINR. 10 refs.; 4 figs.; 6 tabs.

25144 (JINR–5-51-91, pp. 5-13) **An experiment of the A-dependence of the cross section for relativistic deuteron fragmentation into cumulative pions.** Afanas'ev, S.V. (and

others); Anisimov, Yu.S.; Arkhipov, V.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1991. [64p.] In *JINR rapid communications: Collection.* Order Number DE93626358. Source: OSTI; NTIS (US Sales Only); INIS.

The power value of the A-dependence of the cross section for 4.5 GeV/c-A deuteron fragmentation into cumulative pions has been measured on carbon, aluminium, copper, and lead nuclei for cumulative numbers within 0.8-1.2. The mean value is equal to 0.27=0.09 in this interval. The target atomic weight dependence significantly differs from the volume type dependence in the atomic weight of fragmentally nucleus. 8 refs.; 6 figs.

25145 (JINR-D–7-91-481) **Formation of 102-element isotopes in $^{22}Ne+^{236}U$ and $^{26}Ng+^{232}Th$ reactions.** Andreev, A.N. (and others); Bogdanov, D.D.; Eremin, A.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Reactions. 1991. [24p.] (In Russian). Order Number DE93626906. Source: OSTI; NTIS (US Sales Only); INIS.

The formation of the isotopes in th e heavy-ion fusion reactions of $^{32}Ne+^{236}U$ and $^{24}Mg+^{237}Th$ has been investigated by using the kinematic separator VASSILISSA. Extracted fusion barriers from the neutron-evaporation-residue cross sections analysis for the fusion-fission reactions. 68 refs.; 7 figs.; 4 tabs.

25146 (JINR-E–1-92-56) **On studies of the hadron-nucleus collision processes.** Strugalski, Z. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1992. [14p.] Order Number DE93626927. Source: OSTI; NTIS (US Sales Only); INIS.

A new way of hadron-nucleus collision process investigations in experiments is described. It is based on the properties of the hadron passage through layers of the intranuclear matter. The picture of the hadron-nucleus collision mechanism, as prompted experimentally, is presented. 37 refs.; 1 tab.

25147 (JINR-E–1-92-68) **Characteristics of the pion production and proton emission processes in proton-carbon nuclear collisions at 4.2 GeV/c momentum.** Strugalski, Z.; Sultanov, M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1992. [20p.] Order Number DE93626886. Source: OSTI; NTIS (US Sales Only); INIS.

The intensities of the pion production and protons emission in collisions at 4.2 GeV/c momentum are obtained in dependence on the intranuclear matter layer thickness involved in the collision reaction. Pions with large transversal momenta, larger than about 1.2 GeV/.c are presented in the reactions. 7 refs.; 12 figs.; 13 tabs.

25148 (JINR-E–1-92-69) **Characteristics of the pion production and nucleon emission processes in pion-carbon nuclear collisions at 40 GeV/.c.** Strugalski, Z.; Sultanov, M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1992. [19p.] Order Number DE93626928. Source: OSTI; NTIS (US Sales Only); INIS.

Experimental data on pion-carbon nucleus collisions are presented. The momentum and energy spectra of protons emitted from the target nucleus do not depend on the intensity of the pion production in the collisions. 6 refs.; 12 figs.; 12 tabs.

25149 (JINR-E–2-92-64) **Pontecorvo reactions as a general class of antiproton annihilation on nuclei.** Kharzeev, D.E.; Nichitiu, F.; Sapozhnikov, M.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1992. [11p.] Order Number DE93626888. Source: OSTI; NTIS (US Sales Only); INIS.

Reactions of antiproton annihilation forbidden on a free nucleon but allowed on a bound one are considered. It is shown that the investigation of these reactions can be essential in clarifying the role of non-nucleonic degrees of freedom in nuclei. 20 refs.; 4 figs.; 2 tabs.

25150 (JINR-E–2-92-264) **Relativistic impulse approximation and deuteron spin structure.** Tokarev, M.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1992. [12p.] Order Number DE93626887. Source: OSTI; NTIS (US Sales Only); INIS.

The fragmentation processes were considered of tensor- and vector-polarized deuterons to protons in the framework of the covariant approach in the light cone variables on the basis of the relativistic deuteron wave function with one nucleon on-mass shell. The experimental verification of predicted dependences of T_{20} and K is of interest for the research of the momentum and spin distributions of high momentum deuteron constituents. 21 refs.; 6 figs.

25151 (JINR-E–4-92-113) **Data-to-data relations between elastic and inelastic scattering in nuclear rainbow region of angles.** Gareev, F.A. (and others); Ershov, S.N.; Mel'nikova, O.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1992. [16p.] Order Number DE93626895. Source: OSTI; NTIS (US Sales Only); INIS.

It is shown that inelastic scattering cross sections, under suitable approximations, can be re-expressed in terms of the elastic scattering cross sections. 17 refs.; 8 figs.; 3 tabs.

25152 (LA-UR–93-1503) **Quasifree $(\vec{p}, \vec{n})$ reactions and enhancement of pionic processes.** McClelland, J.B. The E881 NTOF Collaboration. Los Alamos National Lab., NM (United States). [1993]. 17p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930389–5: Future directions in particle and nuclear physics at multi-GeV hadron beam facilities, Upton, NY (United States), 4-6 Mar 1993). Order Number DE93012746. Source: OSTI; NTIS; INIS; GPO Dep.

Results from a complete set of polarization-transfer observables for quasifree $(\vec{p}, \vec{n})$ scattering at 495 MeV are reported. Measurements were carried out on CD_2, carbon, and calcium targets at a laboratory scattering angle of 18° using the new Neutron Time-of-Flight facility at LAMPF. The ratio of spin-longitudinal to spin-transverse responses at a momentum transfer of approximately 1.72 fm^{-1} is extracted from the data, as well as the separated responses, and compared to distorted-wave calculations incorporating a Random-Phase Approximation description of the nuclear response. Thespin-transverse response is compared to (e,e′) measurements. The spin-longitudinal response represents new information available from hadron scattering.

25153 (LA-UR–93-1625) **Hypernuclear physics with a neutral meson spectrometer.** Peng, J.C. Los Alamos National Lab., NM (United States). [1993]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930389–11: Future directions in particle and nuclear physics at multi-GeV hadron beam facilities, Upton, NY (United States), 4-6 Mar 1993). Order Number DE93012712. Source: OSTI; NTIS; INIS; GPO Dep.

The (K^-, π^0) reaction, which complements the (K^-, π^-) and the (π^+, K^+) reactions, offers another means to study hypernuclear physics. The physics motivation for measuring the (K^-, π^0) reaction is discussed. The feasibility for detecting π^0 using the LAMPF Neutral Meson Spectrometer is studied with Monte-Carlo simulations. We conclude that the (K^-, π^0) reaction can be well measured at existing kaon beam lines.

25154 (UCRL-ID–111749) **Computer operation of the sensitive neutron counter.** Thorngate, J.H.; Hankins, D.E. Lawrence Livermore National Lab., CA (United States). Nov 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93014374. Source: OSTI; NTIS; GPO Dep.

We measure the neutrons emitted by small amounts of plutonium with a detector that consists of 16 ^3He proportional counters mounted in a large moderator and shield. Integrated circuits located near the proportional counter anode terminals amplify and shape the signals. We redesigned the remaining electronics to fit into a personal computer. the pulses produced by the proportional counters are recorded on commercially available timer/counter boards that plug into the computer. We built the power supplies required by the proportional counters on comparable plug-in boards. We wrote an extensive computer program to acquire, process, store, and print the data.

25155 (CEA-CONF–11245) **Simulation of non-charged particles.** Morillon, B.; Both, J.P.; Nimal, J.C. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie. 1992. [29p.] (In French). (CONF-9210355–: 117. National congress of Scientist Societies, Clermont-Ferrand (France), 26-30 Oct 1992). Order Number DE93626600. Source: OSTI; NTIS (US Sales Only); INIS.

This paper presents the method used to simulate the transport of neutral particles by using a Monte Carlo method with accelerating techniques of convergence based on the importance function by the method of first collision probabilities.

25156 (CONF-921102–60) **G. DeSaussure's early work.** Silver, E.G. Oak Ridge National Lab., TN (United States). [1992]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Joint American Nuclear Society (ANS)/European Nuclear Society (ENS) international meeting on fifty years of controlled nuclear chain reaction: past, present, and future; Chicago, IL (United States); 15-20 Nov 1992. Order Number DE93009710. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the work of Gerard deSaussure in the area of neutron physics research.

25157 (CONF-9304137–2) **The MASH 1.0 code system: Utilization of morse in the adjoint mode.** Johnson, J.O.; Santoro, R.T. Oak Ridge National Lab., TN (United States). [1993]. 19p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. From Centre d'Etudes meeting; Saclay (France); 27-29 Apr 1993. Order Number DE93013271. Source: OSTI; NTIS; GPO Dep.

The Monte Carlo Adjoint Shielding Code System – MASH 1.0, principally developed at Oak Ridge National Laboratory (ORNL), represents an advanced method of calculating neutron and gamma-ray environments and radiation protection factors for complex shielding configurations by coupling a forward discrete ordinates radiation environment (i.e. air-over-ground) transport calculation with an adjoint Monte Carlo treatment of the shielding geometry. The primary application to date has been to determine the radiation shielding characteristics of armored vehicles exposed to prompt radiation from a nuclear weapon detonation. Other potential applications include analyses of the mission equipment associated with space exploration, the civilian airline industry, and other problems associated with an external neutron and gamma-ray radiation environment. This paper will provide an overview of the MASH 1.0 code system, including the verification, validation, and application to "benchmark" experimental data. Attention will be given to the adjoint Monte Carlo calculation, the use of "in-group" biasing to control the weights of the adjoint particles, and the coupling of a new graphics package for the diagnosis of combinatorial geometry descriptions and visualization of radiation transport results.

25158 (DOE/ER/40333–137) **Detection of hot muonic hydrogen atoms emitted in vacuum using x-rays.** Jacot-Guillarmod, R. (Fribourg Univ. (Switzerland)); Bailey, J.M.; Beer, G.A.; Knowles, P.E.; Mason, G.R.; Olin, A.; Beveridge, J.L.; Marshall, G.M.; Brewer, J.H.; Forster, B.M.; Huber, T.M.; Kammel, P. Wyoming Univ., Laramie, WY (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States); Natural Sciences and Engineering Research Council of Canada, Ottawa, ON (Canada); Swiss National Science Foundation, Bern (Switzerland). DOE Contract FG02-87ER40333. (CONF-9204241–1: Ascona workshop on muonic atomic and molecules, Ascona (Switzerland), 5-9 Apr 1992). Order Number DE93010253. Source: OSTI; NTIS; INIS; GPO Dep.

Negative muons are stopped in solid layers of hydrogen and neon. Muonic hydrogen atoms can drift to the neon layer where the muon is immediately transferred. It was found that the time structure of the muonic neon X-rays follows the exponential law where the rate is the same as the disappearance rate of μ^-p atoms. The ppμ-formation rate and the muon transfer rate to deuterium are deduced.

25159 (DOE/ER/40333–138) **Hot muonic deuterium and tritium from cold targets.** Marshall, G.M. (TRIUMF, Vancouver, BC (Canada)); Beveridge, J.L.; Bailey, J.M.; Beer, G.A.; Knowles, P.E.; Mason, G.R.; Olin, A.; Brewer, J.H.; Forster, B.M.; Huber, T.M.; Pippitt, B.; Jacot-Guillarmod, R.; Schellenberg, L.; Kammel, P. Wyoming Univ., Laramie, WY (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States); Natural Sciences and Engineering Research Council of Canada, Ottawa, ON (Canada). DOE Contract FG02-87ER40333. (CONF-9204241–2: Ascona workshop on muonic atomic and molecules, Ascona (Switzerland), 5-9 Apr 1992). Order Number DE93010254. Source: OSTI; NTIS; INIS; GPO Dep.

Experiments are described which use a solid hydrogen layer to form muonic hydrogen isotopes in vacuum. The method relies on transfer of the muon from protium to either a deuteron or a triton. The resulting muonic deuterium or muonic tritium will not immediately thermalize because of the very low elastic cross sections, and may be emitted from the surface of the layer. Measurements which detect decay electrons, muonic x-rays, and fusion products have been used to study the processes. A target has been constructed which exploits muonic atom emission in order to study the energy dependence of transfer and muon molecular formation.

25160 (ECN-RX–92-040) **Direct and preequilibrium effects in the fission-product mass range: Papers presented in the NEANSC Specialists' Meeting on Fission Product Nuclear Data, 25-27 May 1992, JAERI, Japan.** Gruppelaar, H. (Netherlands Energy Research Foundation (ECN), Petten (Netherlands)); Hogenbirk, A. Netherlands Energy Research Foundation (ECN), Petten (Netherlands). Jul 1992. [20p.] (CONF-9205346–: Organization for Economic Cooperation and Development, Nuclear Energy Agency Nuclear Science Committee (NEANSC) specialists' meeting on Fission Product Nuclear Data, Tokaimura (Japan), 25-27 May 1992). Order Number DE93626951. Source: OSTI; NTIS; INIS.

Until recently inelastic scattering did not gain the proper attention in fission-product cross section evaluations. In many existing evaluations global spherical optical models have been used, neglecting direct and pre-equilibrium effects. There are also few experimental data relevant to inelastic scattering in fission products. This paper is focussed on the anomalously high inelastic scattering cross sections observed in even-mass nuclei near mass A=100 at low energies. Both more data and more refined theoretical analyses are required. A number of suggestions for relevant coupled-channel calculations is made. (author). 29 refs., 5 figs., 1 tab.

25161 (EGG-M–92469) **The searchlight problem for neutrons in a semi-infinite medium.** Ganapol, B.D. (Arizona Univ., Tucson, AZ (United States). Dept. of Nuclear and Energy Engineering); Nigg, D.W.; Jahshan, S.N.; Wemple, C.A. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-930404–14: International topical meeting on mathematical methods and supercomputing in nuclear applications (M&C+SNA '93), Karlsruhe (Germany), 19-23 Apr 1993). Order Number DE93010796. Source: OSTI; NTIS; INIS; GPO Dep.

The solution of the Search Light Problem for monoenergetic neutrons in a semi-infinite medium with isotropic scattering illuminated at the free surface is obtained by several methods at various planes within the medium. The sources considered are a normally-incident pencil beam and an isotropic point source. The analytic solution is effected by a recently developed numerical inversion technique applied to the Fourier-Bessel transform. This transform inversion results from the solution method of Rybicki, where the two-dimensional problem is solved by casting it as a variant of a one-dimensional problem. The numerical inversion process results in a highly accurate solution. Comparisons of the analytic solution with results from Monte Carlo (MCNP) and discrete ordinates transport (DORT) codes show excellent agreement. These comparisons, which are free of any associated data or cross section set dependencies, provide significant evidence of the proper operation of both the transport codes tested.

25162 (LA–12570) **Analytic score distributions and moments for a spatially continuous tridirectional Monte Carlo transport problem.** Booth, T.E. Los Alamos National Lab., NM (United States). Jul 1993. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93014012. Source: OSTI; NTIS; GPO Dep.

The interpretation of the statistical error estimates produced by Monte Carlo transport codes is still somewhat of an art. Empirically, there are variance reduction techniques whose error estimates are almost always reliable and there are variance reduction techniques whose error estimates are often unreliable. Unreliable error estimates usually result from inadequate large score sampling from the score distribution's tail. Statisticians believe that more accurate confidence interval statements are possible if the general nature of the score distribution can be characterized. This paper provides the analytic score distribution for the exponential transform applied to a simple spatially continuous Monte Carlo transport problem.

25163 (LA-UR–93-1338) **Distributed processor Monte Carlo: MCNP results on a 16-node IBM cluster.** McKinney, G.W. Los Alamos National Lab., NM (United States). [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9304131–1: Advanced Monte Carlo computer programs for radiation transport, Saclay (France), 27-29 Apr 1993). Order Number DE93012639. Source: OSTI; NTIS; GPO Dep.

The advent of high-performance computer systems has brought to maturity programming concepts like vectorization, multiprocessing, and multitasking. Although there are many schools of thought as to the most significant factor in obtaining order-of-magnitude increases in performance, such speedup can only be achieved by integrating the computer system and application code. Vectorization leads to faster manipulation of arrays by overlapping instruction CPU cycles. Discrete ordinates codes, which require the solving of large matrices, have proved to be major benefactors of vectorization. Monte Carlo transport, on the other hand, typically contains numerous logic statements and requires extensive redevelopment to benefit from vectorization. Multiprocessing and multitasking provide additional CPU cycles via multiple processors. Such systems are generally designed with either common memory access or distributed memory access. In both cases, theoretical speedup, as a function of the number of processors (P) and the fraction of task time that multiprocesses (f), can be formulated using Amdahl's Law S(f, P) = 1/(1 – f + f /P). However, for most applications this theoretical limit cannot be achieved, due to additional terms not included in Amdahl's Law. Monte Carlo transport is a natural candidate for multiprocessing, since the particle tracks are generally independent and the precision of the result increases as the square root of the number of particles tracked.

25164 (LA-UR–93-1392) **Hybrid S_N/Monte Carlo research and results.** Baker, R.S. Los Alamos National Lab., NM (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9304131–2: Advanced Monte Carlo computer programs for radiation transport, Saclay (France), 27-29 Apr 1993). Order Number DE93012677. Source: OSTI; NTIS; INIS; GPO Dep.

The neutral particle transport equation is solved by a hybrid method that iteratively couples regions where deterministic (S_N) and stochastic (Monte Carlo) methods are applied. The Monte Carlo and S_N regions are fully coupled in the sense that no assumption is made about geometrical separation or decoupling. The hybrid Monte Carlo/S_N method provides a new means of solving problems involving both optically thick and optically thin regions that neither Monte Carlo nor S_N is well suited for by themselves. The hybrid method has been successfully applied to realistic shielding problems. The vectorized Monte Carlo algorithm in the hybrid method has been ported to the massively parallel architecture of the Connection Machine. Comparisons of performance on a vector machine (Cray Y-MP) and the Connection Machine (CM-2) show that significant speedups are obtainable for vectorized Monte Carlo algorithms on massively parallel machines, even when realistic problems requiring variance reduction are considered. However, the architecture of the Connection Machine does place some limitations on the regime in which the Monte Carlo algorithm may be expected to perform well.

25165 (SAND–93-0200) **Proton transport methods for satellite shield modeling.** Drumm, C.R. Sandia National Labs., Albuquerque, NM (United States). Mar 1993. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013602. Source: OSTI; NTIS; GPO Dep.

Satellite electronics may be subjected to a large fluence of protons from the Van Allen belt and from solar flares. To determine if unhardened electronics will survive a radiation environment, the total ionizing dose and displacement damage to the electronics must be determined. Several computer codes are available for modeling proton transport, ranging in complexity for a very-efficient straight-line approximation to general-geometry time-dependent Monte Carlo transport, with corresponding increase in computer run time. For most satellite applications, neutrons can be neglected in the analysis. However, neutrons may be important for modeling heavily shielded compartments for personnel and electronics.

25166 (SAND–93-0901C) **Physical optics modelling of soft x-ray projection lithography (SXPL) imaging experiments.** Chow, W.W. (Sandia National Labs., Albuquerque, NM (United States)); Sweatt, W.C.; Lawrence, G.N.; Jewell, T.E. Sandia National Labs., Albuquerque, NM (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9305159–2: Optical Society of America (OSA) topical meeting on soft x-ray projection lithography, Monterey, CA (United States), 10-12 May 1993). Order Number DE93011556. Source: OSTI; NTIS; GPO Dep.

We report our progress on the physical optics modelling of Sandia/AT&T SXPL experiments. The code is benchmarked and the 10X Schwarzchild system is being studied.

25167 (WAPD-TM–1623) **Improved approximate formulas for flux from cylindrical and rectangular sources.** Wallace, O.J.; Bokharee, S.A. Bettis Atomic Power Lab., West Mifflin, PA (United States). Mar 1993. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC11-89PN38014. Order Number DE93011390. Source: OSTI; NTIS; GPO Dep.

This report provides two new approximate formulas for the flux at detector points outside the radial and axial extensions of a homogeneous cylindrical source and improved approximate formulas for the flux at points opposite rectangular surface sources. These formulas extend the range of geometries for which analytic approximations may be used by shield design engineers to make rapid scoping studies and check more extensive calculations for reasonableness. These formulas can be used to support skeptical, independent evaluations and are also valuable teaching tools for introducing shield designers to complex shield analyses.

The traveler presided over Executive Committee and Program Committee Meetings of the International Conference on the Physics of Electronic and Atomic Collisions in Aarhus, Denmark. He participated in experiments to measure dissociative recombination of H_3^+ and HeH^+ using the Heavy Ion Storage Ring (CRYRING) at the Manne Siegbahn Institute (MSI) in Stockholm, Sweden. He also participated in a Forum on Radioactive Nuclear Beams and Muon Beams in Kobe, Japan, where he presented an invited paper on "The Use of Muon Beams in Atomic Physics and A Method to Increase Flux of Radioactive Beams Using Crystal Channeling."

25169 (UCRL-JC–107601) **X-ray conversion in preformed plasmas.** Suter, L.J. (Lawrence Livermore National Lab., CA

(United States)); Kauffman, R.L.; Cray, M. Lawrence Livermore National Lab., CA (United States). 4 Nov 1991. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9110326–2: European conference on laser interaction with matter (ECLIM), Warsaw (Poland), 21-25 Oct 1991). Order Number DE93013347. Source: OSTI; NTIS; GPO Dep.

The authors have carried out 1D and 2D calculational investigations which show that large, preformed plasmas can have higher x-ray conversion efficiencies than discs at the same irradiation intensity. In some situations, the x-ray conversion efficiency can approach 90%. Of the three common theoretical components of conversion efficiency (atomic physics, heat transport, power balance), they believe that changes to the power balance, due to changes in the hydrodynamics, is the mechanism by which preformed plasmas can have a higher conversion efficiency. They draw a more general conclusion from this work; in a world in which atomic physics and heat transport are "fixed", it may be possible to engineer conversion efficiency via changes that modify the power balance. The situation they model assumes a preformed plasma produced by a radiation pulse or a laser pulse. A 1ns preforming pulse, which in this work had a flux of $\sim 2.5 \times 10^{14}$ w/cm^2, strikes a gold target which may be either a sphere or a slab. The authors wait some delay time to allow plasma to evolve. Then they fire a 3ns, 3ω laser pulse into the preformed plasma. In this paper they discuss modelling results for three situations: a spherical preformed, spherically illuminated plasma; an infinite preformed plasma slab, infinitely illuminated; and an infinite preformed plasma slab illuminated with a finite size spot. The parameters of this study are delay time (which varies the scalelength of the preformed plasma) and laser intensity. The resulting plasmas for delay times of 3ns, 6ns and 10ns have scale lengths of $\sim 200\mu$m, $\sim 500\mu$m and $\sim$1mm, respectively.

25170 (UCRL-JC–111868) **Highly charged ions in hot, dense plasmas.** Osterheld, A.L.; Walling, R.S.; Young, B.K.F.; Goldstein, W.H.; Shimkaveg, G.; MacGowan, B.J.; Da Silva, L.; Keane, C.; Hammel, B.; London, R.; Stewart, R.E. Lawrence Livermore National Lab., CA (United States). Sep 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920948–12: 6. international conference on physics of highly charged ions, Manhattan, KS (United States), 28 Sep - 2 oct 1992). Order Number DE93013348. Source: OSTI; NTIS; GPO Dep.

Highly-charged ions play a critical role in hot, dense plasmas. They affect the energy balance and hydrodynamic evolution of transient plasmas. The radiation emitted by highly charged ions may be used in several practical applications, such as inertial confinement fusion, short wavelength lasers, and x-ray sources for lithography and microscopy applications. This radiation may also be used to diagnose the conditions in plasmas. In recent years, models have been developed to describe the atomic kinetics of complex ionization states of highly charged ions in plasmas. However, reliable atomic calculations and careful experiments which test both the fundamental atomic physics and the assumptions of the plasma emission models are required.

Some recent researches are described concerning the effects of the state of coherence of a source on the spatial and the spectral distributions of energy generated by the source. The researches have elucidated the foundations of radiometry and they have also revealed some unexpected new phenomena relating to spectral changes which can be induced by source correlations and also by scattering on random media.

Measurements of state-to-state deactivation cross sections and radiative lifetimes were made for Xe*(6p,6p',7p) and Kr*(5p) states in xenon and krypton buffer gases. These results are relevant to kinetic models of both excimer lasers and the infrared xenon laser. Attempts were made to continue studies of two-photon laser assisted collisions in the reaction $Xe + Cl_2 + \hbar\omega \rightarrow (Xe^+{}_oCl_2{}^-) \rightarrow XeCl^*(high\ v) + Cl$. These experiments along with studies of the XeCl*(B, C, and D) branching fractions are reported along with studies of the two-photon spectroscopy of Cl_2. In addition, significant progress was made in the study of the spectroscopy of small molecules and excimers formed in supersonic beams. Although emphasis is on xenon excimers excited in two-photon transitions, larger rare gas clusters were measured splitting between the 2s and 2p excitons is not explainable by currently excepted models for excitons in liquid xenon. Finally, work to obtain fluorescent spectra of xenon excimers in supersonic jets is described.

25174 (DOE/ER/13456–50) **Photodetachment studies on few-electron atomic negative ions.** Pegg, D.J. Tennessee Univ., Knoxville, TN (United States). Dept. of Physics. [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-85ER13456. (CONF-9210339–1: Workshop on atomic physics, Ithaca, NY (United States), Oct 1992). Order Number DE93008474. Source: OSTI; NTIS; INIS; GPO Dep.

A crossed laser-negative ion beams apparatus, situated at Oak Ridge National Laboratory has been used for energy and angle-resolved photoelectron spectroscopic measurements following photodetachment. In the current grant period measurements of the cross sections for photodetaching an electron from the Li^- ion were finished. Measurements of the $\sigma(B^-)/\sigma(Li^-)$ ratio, with a goal of determining photodetachment cross section for B^-, were started. An investigation of the photodetachment of the metastable ion Be^- also began. Preliminary data on the electron affinity, asymmetry parameter and cross section associated with the photodetachment of Be^- at a photon energy of 2.076 eV is reported.

The Krypton Isotope Laser Analysis (KILA) method is being developed at the Pacific Northwest Laboratory (PNL) to measure ^{85}Kr concentrations in small air samples. The technique uses high-resolution lasers to excite individual isotopes of krypton specifically to induce ^{85}Kr to fluorescence for detection by optical means. Production of krypton metastables via two-photon excitation to the $2p_6$ state has been shown to be 0.15% efficient in 0.13 mTorr of krypton–sufficiently high to demonstrate overall feasibility of the KILA method. Since this goal was met, focus has been directed toward development of a working vacuum ultraviolet (VUV) fluorescence detection system and toward understanding the VUV background. This report describes the progress made in these two areas. The second step of the KILA process is to optically pump all except the ^{85}Kr isotopes from the metastable state back to the ground state using laser-induced fluorescence (LIF). The rate of this process and the VUV background afterward will determine the sensitivity and selectivity of the KILA approach. De-excitation of the metastable population was accomplished via one-photon absorption of a continuous-wave (c-w) laser to the $2p_8$ energy level. Non-isotopically selective de-excitation rates as high as 5×10^5 sec^{-1} have been measured, yielding a signal-to-background ratio of $>10^6$. The lifetime of the metastables is 1.2 msec in 200 mTorr of neon–much longer than the time required to de-excite krypton metastables and to detect fluorescence produced by ^{85}Kr. After attaining these high de-excitation rates, a gated VUV detection system was built with a dynamic range large enough to measure a small background following de-excitation of large metastable populations. Future experiments will focus on reducing the background level by another 2–3 orders of magnitude and perfecting the isotopically selective de-excitation technique with known samples.

25179 (UCRL-CR–103295-92) **High resolution stimulated brillouin spectroscopy in glasses and crystals.** Faris, G.W. (SRI International, Menlo Park, CA (United States). Molecular Physics Lab.); Jusinski, L.E.; Hickman, A.P. Lawrence Livermore National Lab., CA (United States). 24 Apr 1992. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93013135. Source: OSTI; NTIS; GPO Dep.

Theory and measurements are presented for stimulated Brillouin gain spectroscopy in anisotropic media. The coupling between arbitrary pump and Stokes waves and the corresponding acoustic wave is formulated in terms of the elastic displacement vector and the photoelastic tensor. A propagation equation that fully includes transient effects is obtained for the Stokes wave. In the limit of small signal gains, this propagation equation can be solved analytically, yielding expressions that relate experimentally accessible quantities to material properties. Absolute Brillouin steady-state gain coefficients, linewidths, and frequency shifts are thereby determined in a number of optical materials at 532 nm. The Brillouin gain coefficient for fused silica is measured by three techniques, providing the reference for absolute gain measurements. Quantitative agreement is found between theory and experiment for transient effects on stimulated Brillouin scattering.

25180 (UCRL-ID–112298) **High-order harmonic conversion efficiency in helium.** Crane, J.K. Lawrence Livermore National Lab., CA (United States). 23 Oct 1992. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93011714. Source: OSTI; NTIS; INIS; GPO Dep.

Calculated results are presented for the energy, number of photons, and conversion efficiency for high-order harmonic generation in helium. The results show the maximum values that we should expect to achieve experimentally with our current apparatus and the important parameters for scaling this source to higher output. In the desired operating regime where the coherence length, given by $L_{coh}=\pi b/(q-1)$, is greater than the gas column length, l, the harmonic output can be summarized by a single equation: $N_q=[(\pi^2 n^2 b^3 \tau_q |d_q|^2)/4h]\{(p/q)(2l/b)^2\}$. N_q - numbers of photons of q-th harmonic; n - atom density; b - laser confocal parameter; τ_q - pulse width of harmonic radiation; q - harmonic order; p - effective order of nonlinearity. (Note the term in brackets, the phase-matching function, has been separated from the rest of the expression in order to be consistent with the relevant literature).

25181 (UCRL-JC–110217) **X-ray production ~130 Å from laser-produced plasmas for projection x-ray lithography applications.** Kauffman, R.L.; Phillion, D.W.; Spitzer, R.C. Lawrence Livermore National Lab., CA (United States). 30 May 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9204120–5: Soft-x-ray projection lithography topical meeting, Monterey, CA (United States), 6-8 Apr 1992). Order Number DE93009256. Source: OSTI; NTIS; INIS; GPO Dep.

X-ray production in the region around 130 Å from laser-produced plasmas have been investigated as a source for projection x-ray lithography. The dependence of x-ray conversion efficiency on target material, intensity, and pulse length has been studied using a 0.53 μm laser with a maximum of 0.3 J. Conversion efficiency of 1% into a 3 Å bandwidth has been demonstrated for Sn targets at intensities around 10^{11} W/cm^2 using a 7.5 ns pulse. Intensity scaling suggests that laser spot size and two-dimensional expansion are important for optimizing x-ray production at these low irradiation intensities.

Mirage, CA (United States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

Two important types of low-energy gas phase ionization and rearrangement reactions between positrons and molecules are considered: (a) those leading to species containing bound positronium, and (b) those resulting in fragmentation of the molecule. In simple cases of type (a) reactions, the energetics are transparent, but the quantum mechanics are understood only in outline; for type (b) reactions, surprising results are observed which are not yet well understood.

25183 (DOE/ER/13971–20) **Measurements of scattering processes in negative ion-atom collisions: Technical progress report, 1 September 1992–31 August 1993.** Kvale, T.J. Toledo Univ., OH (United States). Dept. of Physics and Astronomy. [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-88ER13971. Order Number DE93013863. Source: OSTI; NTIS; INIS; GPO Dep.

This Technical Progress Report describes the progress made on the research objectives during the past twelve months. This research project is designed to provide measurements of various scattering processes which occur in H^- collisions with atomic (specifically, noble gas and atomic hydrogen) targets at intermediate energies. These processes include elastic scattering, single- and double-electron detachment, and target excitation/ionization. For the elastic and target inelastic processes where H^- is scattered intact, the experimental technique of Ion Energy-Loss Spectroscopy (IELS) will be employed to identify the final target state(s). In most of the above processes, cross sections are unknown both experimentally and theoretically. The measurements in progress will provide either experimentally determined cross sections or set upper limits to those cross sections. In either case, these measurements will be stringent tests of our understanding in energetic negative ion - atom collisions. In addition secondary negative particle emission yields for H^0 on Cu in the 3 to 50 keV range are shown.

25184 (DOE/ER/14263–1) **[Experiments in ultracold collisions]: Progress report, May 1, 1992–November 1, 1992.** Gould, P.L. Connecticut Univ., Storrs, CT (United States). 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER14263. Order Number DE93012110. Source: OSTI; NTIS; GPO Dep.

Conditions in an ultracold magneto-optical laser trap were studied; the trap is being used to investigate collisions of ^{85}Rb and ^{87}Rb atoms at temperatures below 1 mK. The ballistic time-of-flight method was used to determine the temperature. It was found that the temperature increases monotonically with laser intensity; this means that the temperature dependence of various collisional processes can probably be measured. The trap size was found to be independent of laser intensity, except at the lowest intensities.

In *IAEA consultants' meeting on He-beam data base for alpha particle diagnostics of fusion plasmas: Summary report.* [55p.] Order Number DE93626995. Source: OSTI; NTIS (US Sales Only); INIS.

In the context of helium-beam attenuation in plasmas and fusion alpha particle diagnostics, a database of cross sections for electron impact excitation and ionization of helium atoms is required. This report is issued by the Working Group that aims to arrive at a recommended database of this kind. Due to the large variety of collision processes that need to be considered the Working Group could not arrive at a final recommendation. However, it appears that sufficient knowledge is available for application in calculations of helium beam stopping cross sections in a fusion plasma. Several reviews useful for helium beam stopping and diagnostics in fusion plasmas are listed. Various electron-collision channels for singlet excitation from the helium ground state as well as triplet excitation from the helium ground state are listed together with the energy range, the method, reference, and the accuracy of the cross-section data. Also discussed and referenced are data on electron-collision induced transitions between excited helium states and electron-collision induced ionization, from the ground state as well as from excited states of helium.

25192 (BNL–48611) **Dynamics of dissociation versus ionization in strong laser fields.** DiMauro, L.F.; Yang, B. Brookhaven National Lab., Upton, NY (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930184–2: 3. SILAP conference, Hansui (Belgium), 8-14 Jan 1993). Order Number DE93009261. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper, experimental results are presented which clearly demonstrate the effectiveness that an external field has in altering the dissociation dynamics. The experiment examines the strong-field dissociation dynamics of molecular hydrogen ions and its deuterated isotopes. These studies involve multiphoton excitation in the intensity regime of 10^{11-14} W/cm^2 with the fundamental and second harmonic of a ND:YAG or ND:YLF laser system. Measurements include energy resolved electron and mass spectroscopy which provide useful probes in elucidating the interaction dynamics predicted by existing models. The example this in this paper, examines the strong-field dissociation of H_2^+, HD^+, and D_2^+ at green (0.5 μm) and (1 μm) frequencies. The diatomic ions are formed via multiphonon ionization of the neutral precursor which is physically separable from the dissociation process. This study provides the first observation of the dynamics associated with the above threshold dissociation (ATD) process and analogies will be made with the more familiar above threshold ionization (ATI) phenomenon.

We report on our program in detecting two-electron ionization using electron-electron and electron-ion coincidence measurements. The coincidence techniques have been applied to the multiphoton ionization (MPI) of xenon atoms with 0.527 μm excitation. The results show that direct two electron ionization is not occurring which is in variance with an earlier report. We also present a polarization study on the MPI of helium at 0.62 μm and discuss these results in context of existing models.

Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-36. From 4. international conference on multiphoton processes (ICOMP IV); Boulder, CO (United States); 13-17 Jul 1987. Order Number DE93011367. Source: OSTI; NTIS; GPO Dep.

The character of many-electron interactions in atoms is examined in relation to a possible role for these couplings in multiphoton processes. It is found that they provide a natural mechanism which can produce both (1) anomalously rapid rates of multiphoton ionization and (2) the direct production of electronically excited ionic species. Furthermore, it is determined that these two phenomena should be strongly correlated. On this basis, the experimental data concerning multiphoton ionization and the generation of fluorescence give evidence for a significant role for two-electron amplitudes in the heavy rare gases. For subpicosecond irradiation at 248 nm, the data indicate that the multi-electron processes become important above an intensity of $\sim 10^{14}$ W cm^{-2}, particularly for xenon. The trend exhibited by these findings suggests that multi-electron processes will become increasingly prominent at intensities above $\sim 10^{16}$ W cm^{-2}.

25195 (FEI–2173) **Effect of oxygen concentration and ordering on vanadium-oxygen alloy vibrational spectra: Frequency spectra calculation.** Sumin, V.V.; Danilkin, S.A.; Minaev, V.P. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1991. [19p.] (In Russian). Order Number DE93627003. Source: OSTI; NTIS (US Sales Only); INIS.

The calculations of disordered interstitial solid solution vanadium - oxygen vibrational spectra are presented. The qualitative description of vanadium atom spectrum deformation caused by oxygen was obtained in frame of virtual crystal approximation. The interatomic vanadium - oxygen potential is presented. The oxygen atoms vibrational spectra for different oxygen contents were calculated using the computer simulation method. The concentration dependence of oxygen vibrational band widths and the oxygen atoms ordering effects are discussed. 17 refs.; 5 figs.; 3 tabs.

25196 (LA–93009869) **Experimental observations of resistive cooling in a Penning trap.** Cornford, S.L. Los Alamos National Lab., NM (United States). May 1992. 117p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93009869. Source: OSTI; NTIS; GPO Dep.

Thesis submitted by S.L. Cornford to Texas A&M University, College Station.

Large numbers of antiprotons cooled by LEAR(CERN) to 2 MeV and subsequently cooled to a few hundred eV must be brought to much lower density velocity in order to measure their gravitational acceleration by the earth. A sufficient number of antiprotons near an end-point speed of 5 m/s will be available if about 10^5 $\bar{p}$s per extraction are in a thermal distribution with an average energy of about 10 K. Passive ("resistive") cooling is a well understood and previously demonstrated method which may be extended to achieve such a velocity distribution. This research demonstrates the viability of such a cooling method. By using a superconducting resonant coil with a 4 K Penning trap, resistive cooling of He^- ions

is observed, with a minimum cooling time constant of $1.8_{-0.2}{}^{-0.5}$ seconds. This value translates into an H^+ or $\bar{p}$ cooling time constant of ~0.5 seconds.

25197 (LA-SUB–93-123) **Measurements of electron densities and collision frequencies in high power microwave breakdown plasmas in low pressure air: Final report.** Stalder, K.R. (SRI International, Menlo Park, CA (United States)); Eckstrom, D.J. Los Alamos National Lab., NM (United States); SRI International, Menlo Park, CA (United States). Mar 1989. 18p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93012881. Source: OSTI; NTIS (US Sales Only); GPO Dep.

We report Measurements of the electron density and collision frequency in high power microwave discharges in low pressure air. A microwave interferometer operated at 9.59 GHz was used for these measurements. The plasmas were formed in an evacuable tank by breakdown of low pressure air in the constructive interference regions where 2.86 GHz microwaves reflected from an inclined plate. The pressure range was from 0.01 Torr to 3.0 Torr. The results show that the electron density rose quickly, consistent with ionization rates predicted by theory, then became overdense (for the 2.86 GHz microwaves) and decayed slowly after the high power microwaves were turned off. The electron density decayed with a rate of proportional to pressure. The electron collision frequency ranged from 1×10^{10} sec^{-1} to 2×10^{11} sec^{-1}, and did not scale linearly with pressure. Anomalously high attenuation was observed, and was responsible for these results. The sources of the high attenuation most likely were refractive losses and diffractive losses from the structured plasma.

25198 (UCRL-JC–110145) **Time-dependent dynamics of an atom in an intense laser field.** Kulander, K.C.; Krause, J.L.; Schafer, K.J.; Allendorf, S.W.; Crane, J.K.; Budil, K.S.; Perry, M.D. Lawrence Livermore National Lab., CA (United States). 27 Mar 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9203238–2: North Atlantic Treaty Organization (NATO) advanced research workshop on time dependent quantum molecular dynamics: experiments and theory, Snowbird, UT (United States), 30 Mar - 3 apr 1992). Order Number DE93012572. Source: OSTI; NTIS; GPO Dep.

A laser excited atom emits both electrons and photons. A method involving the explicit solution of the time-dependent Schroedinger equation is used to determine the ionization and photoemission rates for Kr in a 532 nm laser at intensities in the range from 10^{12}–10^{14} W/cm^2. The photon spectrum is dominated by strong peaks at odd multiples of the driving frequency. This is called harmonic generation. The results are compared to obtained experimental rates. Also electron angular distributions and spin-orbit branching ratios for the ion are given for the case of excitation by a 1064 nm laser and its second harmonic. The dependence of the final state distributions on the relative phase between the lasers is presented.

25199 (CONF-9209221–, pp. 327-334) **Formation of positronium compounds in slow positron beams.** Schrader, D.M. (Marquette Univ., Milwaukee, WI (US)). Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

The formation of stable positronium compounds in rearrangement collisions of positrons and molecules is considered. The discussion focuses on energetics and quantum mechanics, with emphasis being given to the role of the intermediate resonance state. The calculation of the cross section and the role of spin is considered. Some conjectures concerning possible future work are given.

Purpose is to develop an equation of state for predicting the thermodynamic properties of fluids containing chain-like molecules ranging from alkanes to polymers. Foundation of this work is the Generalized Flory Dimer (GFD) theory. GFD is extended to square-well chain mixtures. The second virial coefficient has been evaluated for hard-chain and square-well chain fluids using a Monte Carlo approach. The polymer RISM theory was used to determine the segment-segment radial distributrion function for hard chain fluids. Monte Carlo simulations are being performed of the self-diffusion coeffient, shear and longitudinal viscosities, and thermal conductivity for hard chain fluids. (DLC)

Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84ER45133. Order Number DE93015095. Source: OSTI; NTIS; GPO Dep.

The major activities in this period are the percolation threshold in electronic conduction in β-alumina type solid electrolytes, mixed alkali effects in ion conducting binary glasses, chemical diffusion problems, semiconductors, and relaxation process in diffusion. The last one constitutes the recent progress.

25202 (LA-UR–93-1296) **Quantum Monte Carlo by message passing.** Bonca, J.; Gubernatis, J.E. Los Alamos National Lab., NM (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9302112–2: Madi Gras conference on concurrent computing in the physical sciences, Baton Rouge, LA (United States), 18-20 Feb 1993). Order Number DE93012645. Source: OSTI; NTIS; GPO Dep.

We summarize results of quantum Monte Carlo simulations of the degenerate single-impurity Anderson model using the impurity algorithm of Hirsch and Fye. Using methods of Bayesian statistical inference, coupled with the principle of maximum entropy, we extracted the single-particle spectral density from the imaginary-time Green's function. The variations of resulting spectral densities with model parameters agree qualitatively with the spectral densities predicted by NCA calculations. All the simulations were performed on a cluster of 16 IBM R6000/560 workstations under the control of the message-passing software PVM. We described the trivial parallelization of our quantum Monte Carlo code both for the cluster and the CM-5 computer. Other issues for effective parallelization of the impurity algorithm are also discussed.

25203 (SAND–92-1716C) **An improved material interface reconstruction algorithm for Eulerian codes.** Bell, R.L. (Amparo Corp., Albuquerque, NM (United States)); Hertel, E.S. Sandia National Labs., Albuquerque, NM (United States). [1992]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9211128–7: 1992 nuclear explosives code developers conference, Sunnyvale, CA (United States), 2-6 Nov 1992). Order Number DE93011679. Source: OSTI; NTIS (US Sales Only); GPO Dep.

In general, shock wave physics codes can be divided into two major categories: (1) Lagrangian codes and (2) Eulerian codes. (A third category, Arbitrary Lagrangian Eulerian (ALE) codes, allows the computational mesh to move with the material until some measure of mesh distortion is achieved, then the mesh is redefined and the materials are allowed to flow through the mesh, as in an Eulerian calculation.) With Lagrangian codes the cell boundaries also form the interface between different materials in a calculation. In an Eulerian calculation, the cell boundaries may initially form the interface between materials, but as the calculation proceeds and materials flow through the mesh, material interfaces will not lie on

cell boundaries. Knowledge about the location of materials in a mixed material cell is necessary to determine the correct advection of materials from a mixed cell as an Eulerian (or ALE) code calculation progresses through time. Using a material interface reconstruction algorithm that is unable to accurately determine material interface locations is analogous to running a one material problem using a first order accurate differencing scheme. The material interface reconstruction method described here is an extension to the method developed by D.L. Youngs. Youngs' method uses volume fraction information from the donor cell and all surrounding cells to determine the orientation and location of planes dividing materials from one another in a mixed material cell. Many codes use the popular Simple Line.

25204 (UCRL-ID–111487) **Computational procedures for determining parameters in Ramberg-Osgood elastoplastic model based on modulus and damping versus strain.** Ueng, Tzou-Shin; Chen, Jian-Chu. Lawrence Livermore National Lab., CA (United States). Jul 1992. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93013309. Source: OSTI; NTIS; GPO Dep.

A computer code, RAMBO, is developed for obtaining the values of parameters in the Ramberg-Osgood elastoplastic model based on data of shear modulus and damping ratio at various shear strains. The basis and procedures for finding the parameters for the best fit of the data or relations defining modulus and damping ratios versus shear strain are given in this report. The Ramberg-Osgood relationship is rearranged so that the results can best fit data of both modulus and damping ratio. Constraints of data in the model are also discussed.

25205 (UCRL-JC–111904) **Monte Carlo simulation of the OCP freezing transition.** DeWitt, H.E. (Lawrence Livermore National Lab., CA (United States)); Slattery, W.L.; Yang, Juxing. Lawrence Livermore National Lab., CA (United States). Sep 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9208135–6: International conference on the physics of strongly coupled plasmas, Rochester, NY (United States), 17-21 Aug 1992). Order Number DE93013039. Source: OSTI; NTIS; INIS; GPO Dep.

The One Component Plasma (OCP) in three dimensions is a system of classical point charges moving in a fixed uniform neutralizing background. In nature the OCP is a rough approximation of the conditions in a white dwarf star in which one has fully ionized nuclei such as carbon, oxygen, and smaller amounts of heavier elements up to iron all moving in a nearly uniform background provided by relativistically degenerate electrons. The OCP is also a mathematical limiting model for a non-neutral plasma of ions in a Penning trap and cooled to strongly coupled conditions. Similarly, a collection of charge colloidal suspensions in water can exhibit the Coulomb freezing behavior of the OCP. A single dimensionless parameter, Γ is sufficient to describe the system. For very weak coupling, $\Gamma \ll 1$, the thermodynamic properties of the OCP are given rigorously by the Debye-Huckel theory. This paper reports on Monte Carlo simulation of the freezing of the OCP from a random start for particle numbers ranging from 500 to 2000. In one case the authors obtained a perfect bcc lattice, but in most cases the final state would be an imperfect crystal or two different microcrystals, fcc and bcc, growing into each other. With a cluster analysis program the authors looked at the formation of nucleating clusters, and followed the actual freezing process. Roughly 80 particles are needed in a cluster before it starts to grow rapidly and freeze.

25206 (BNL–48628) **A new matrix for the "ageless" 21.6-keV ^{151}Eu nuclear gamma ray Moessbauer source.** Wynter, C.I. (Nassau Community College, Garden City, NY (United States). Dept. of Chemistry); Haustein, P.E.; Stadelmaier, H.; Thorpe, A.; Spijkerman, J.J.; Nowik, I. Brookhaven National Lab., Upton, NY (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-930195–1: 2. Nassau Moessbauer conference, Garden City, NY (United States), 8 Jan 1993). Order Number DE93009795. Source: OSTI; NTIS; GPO Dep.

Moessbauer spectroscopy has been used over the past two decades to advance the study of europium compounds and alloys, primarily utilizing the 21.6-kev gamma ray emitted from beta decaying ^{151}Sm. This isotope, which has a 87 year half-life, has been used in either a samarium fluoride (SmF^3) or samarium oxide (Sm_2O_3) matrix. We now report a study involving, europium oxalate decahydrate ($Eu2(C_2O_4)\cdot 10H_2O$), europium fluoride EuF_3 and $EuBe_{13}$ as absorbers at known thicknesses. Our data supports the view that $Sm_2(C_2O_4)_3\cdot H_2O$ will provide a better source matrix than either the fluoride or oxide due to the narrower linewidth and comparable "f" factor to $^{151}SmF_3$.

25207 (CEA-CONF–11233) **Positron annihilation in electron irradiated GaAs: atomic structure and charge state of the defects.** Corbel, C. (Institut National des Sciences et Techniques Nucleaires (INSTN), Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France)); Pierre, F.; Moser, P.; Hautojarvi, P.; Saarinen, K. Institut National des Sciences et Techniques Nucleaires (INSTN), Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). 1991. [6p.] (CONF-9107146–: 16. international conference on defects in semiconductors, Bethlehem, PA (United States), 22-26 Jul 1991). Order Number DE93627276. Source: OSTI; NTIS (US Sales Only); INIS.

Positron lifetime measurements show that electron irradiation produces negative vacancies and negative ions at 20 K in semi-insulating GaAs. The vacancies anneal between 77-500 K with a sharp stage in the range 270-370 K. The ions anneal at high temperature above 450 K. The negative ions are identified to isolated gallium antisites. The negative vacancies are identified to gallium vacancies either isolated or involved in negatively-charged complexes. The introduction rate of the gallium antisites is estimated to be 1.8 ± 0.4 cm^{-1} after 1.5 MeV electron irradiation at 20 K.

25208 (CEA-CONF–11234) **Vacancy in the metastable state of the EL2 defect in GaAs.** Corbel, C. (Institut National des Sciences et Techniques Nucleaires (INSTN), Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France)); Leberre, C.; Hautojarvi, P.; Saarinen, K.; Liszkay, L. Institut National des Sciences et Techniques Nucleaires (INSTN), Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). 1991. [5p.] (CONF-9107146–: 16. international conference on defects in semiconductors, Bethlehem, PA (United States), 22-26 Jul 1991). Order Number DE93627277. Source: OSTI; NTIS (US Sales Only); INIS.

Photoquenching of the EL2 defects in semi-insulating GaAs increases positron trapping at vacancies. This is associated to a metastable vacancy having the following properties: it recovers as the metastable state of EL2, its concentration correlates with that of EL2, and its charge is negative. We conclude that the metastable vacancy is involved in the atomic configuration of the metastable state of the EL2 defect.

25209 (CONF-930822–3) **High resolution microscopy of ceramic surfaces.** Bentley, J. Oak Ridge National Lab., TN (United States). [1993]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Annual meeting of the Electron Microscopy Society of America; Cincinnati, OH (United States); 1-6 Aug 1993. Order Number DE93013205. Source: OSTI; NTIS; GPO Dep.

The characterization of ceramic surfaces plays an important role in understanding a wide variety of properties such as fracture, wear, crack initiation, oxidation, sintering, and thin film growth on substrates. Three major microscopies are employed to obtain nanometer-scale resolution of ceramic surfaces: scanning electron microscopy (SEM), (scanning) transmission electron microscopy (STEM or TEM) especially in the glancingincidence reflection modes, and scanning tip microscopies - most notably atomic force microscopy (AFM). Each technique has its own set of characteristics, advantages, and disadvantages and is usually complementary to the others.

25210 (DOE/ER/45163–33) **X-ray and γ-ray spectroscopy of solids under pressure: Annual technical progress report, October 1990–October 1993.** Ingalls, R.L. Washington Univ., Seattle,

WA (United States). Dept. of Physics. 30 Apr 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-84ER45163. Order Number DE93014847. Source: OSTI; NTIS; GPO Dep.

The following studies are described that were either completed during this 3-year period or are well underway: XAFS study of pressure-induced transition in Rb-W bronze ($Rb_{0.31}WO_3$); XAFS study of bcc-hcp transition in Fe; XAFS search for valence change in thallium perhenate ($TlReO_4$) at high pressure; XANES analysis of alkali halides; pair potentials in alkali halides studied via EXAFS; EXAFS determination of bond angles in ReO_3; XAFS study of mixed-valence transition in SmSe; Moessbauer studies of Fe hydride at high pressure; and Moessbauer and x-ray studies of Fe silicate spinel at high pressure. (DLC)

25211 (DOE/ER/45233–8) **Application of spin-sensitive electron spectroscopies to investigations of electronic and magnetic properties of solid surfaces and epitaxial systems: Progress report, 1 November 1992–31 October 1993.** Walters, G.K.; Dunning, F.B. Rice Univ., Houston, TX (United States). Apr 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-86ER45233. Order Number DE93015079. Source: OSTI; NTIS; INIS; GPO Dep.

Research during this year focused on angular dependence of polarization of electrons backscattered from metallic surfaces, as a function of energy loss, using spin-polarized electron energy loss spectroscopy (SPEELS), and on dynamics of metastable He(2^3S) deexcitation at Xe-covered metallic surfaces using spin-polarized metastable deexcitation spectroscopy (SPMDS). In the SPEELS study, the data from Au, Ag, Mo, and Fe surfaces suggest that all inelastically scattered electrons underwent small-angle inelastic scattering either preceded or followed by large-angle elastic scattering that redirects the incident electron away from the target. The SPMDS study was extended from other gases to include rare=gas adsorbates on Cu(100) and Au(100) surfaces; the spectra from the Xe- metal systems are unlike hose from other systems and may provide new insights into metastable-surface interactions. (DLC)

25212 (DOE/FTR–93013655) **Participation in the 3rd international conference on nuclear microprobe technology and applications held in Uppsala, Sweden: Foreign trip report, June 3–13, 1992.** Doyle, B.L. Sandia National Labs., Albuquerque, NM (United States). 1992. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013655. Source: OSTI; NTIS (US Sales Only); GPO Dep.

I presented a talk titled "Ion Beam Induced Charge Collection (IBICC) microscopy of ICs: Relation to Single Event Upsets (SEUs)" at the Microbeam Conference in Uppsala. A similar invited seminar was presented at the University of Lund. This conference is held every 2 1/2 years and is a forum for scientists developing and utilizing nuclear microprobes (i.e., scanned MeV microfocused ion beam systems). R&D on the Sandia nuclear microbeam remains among the most innovative in the world, and new microscopic analyses of both the ion-induced malfunction and active volumes of integrated circuits were presented at the meeting. Following our invention of single event upset imaging, ~6 other groups are now exploring this and other nuclear microscopic studies of Ics. In addition to attending the meeting, I also visited the nuclear microprobe laboratories at Uppsala and Lund University and also the proton radiotherapy laboratory at Uppsala.

25213 (FRCEA-TH–378) **Investigation of new NMR methods for structural and dynamic studies in the liquid state.** Desvaux, H. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Recherche sur l'Etat Condense, les Atomes et les Molecules; Paris-6 Univ., 75 (France). 21 Jan 1993. [141p.] (In French). Order Number DE93627278. Source: OSTI; NTIS (US Sales Only); INIS.

After a short presentation of the NMR fundements, three new methods of spin -lattice relaxation in liquids are reported. (1) The method consists of measuring the steady-state nuclear magnetization under strong off-resonance rf irradiation as a function of the angle θ between external field and effective field. For purely dipolar relaxation between homonuclear spins under isotropic Brownian molecular rotation, this variation yields the value of the local correlation time. A departure from the theoretical shape reveals the existence of complex motions or complex relaxation mechanisms. These results have been verified by experimental illustrations. Some numerical simulations have been performed for studying the effects of the distribution of chemical shift and for studying the coherence of the local correlation time concept. (2) The improvements of a modified ROESY experiment are discussed. The use of a time-modulated strong off-resonances rf irradiation permits to suppress totally the problems of the NOESY (suppression of cross-relaxation peaks for molecules where $\omega\tau_c \simeq 1.1$) and of the ROESY (HOHAHA transfer and angular dispersion due to the chemical shift distribution). The angle θ defined previously can be used as a constraint: either to obtain a ratio of the cross over direct dipolar relaxation rates independent on the correlation time value, or to observe the sole chemical exchange. (3) The difference of the relaxation rates of the coherences at zero and two quanta is always exactly the cross relaxation rates measured by the NOESY experiment. The experimental illustration is presented.

25214 (FRNC-TH–3726) **Study of dynamic polarization in low fields of free radicals in solution. Application to NMR magnetometry.** Pellerej, M.P. Grenoble-1 Univ., 38 (France). Mar 1992. [230p.] (In French). Order Number DE93627279. Source: OSTI; NTIS (US Sales Only); INIS.

This thesis is a theoretical and experimental study of performance in dynamic polarization of new radicals based on phosphorus for low field NMR magnetometry. Radical-solvent pairs are selected from a theoretical analysis. Anisotropic hyperfine coupling importance in the ESR line broadening for phosphoreted radicals is evidenced. Various systems are investigated and interpreted by numerical models. Phosphoranyle radicals in solution in tetrahydrofuran are the most promising. Electron-proton coupling is investigated leading to the development of a NMR relaxometer with a free precession in the terrestrial magnetic field.

25215 (LA-UR–93-1519) **Rietveld refinement of magnetic structures from pulsed-neutron-source powder-diffraction data.** Robinson, R.A.; Lawson, A.C.; Larson, A.C.; Von Dreele, R.B.; Goldstone, J.A. Los Alamos National Lab., NM (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9305177–2: 12. International collaboration of advanced neutron sources meeting (ICANS), Abingdon (United Kingdom), 24-28 May 1993). Order Number DE93012740. Source: OSTI; NTIS; GPO Dep.

The General Structure Analysis System, GSAS, has recently been modified to include magnetic neutron-scattering cross-sections. Low-temperature diffraction data have been taken on the hexagonal noncollinear antiferromagnet UPdSn on both the HIPD and the NPD powder diffractometers at LANSCE. The low-resolution data reveal that the magnetic structure has orthorhombic symmetry (magnetic space group P_c112_1) between 25K and 40K, and monoclinic symmetry (magnetic space group P_c112_1) below 25K. The high-resolution data reveal that there are structural distortions with corresponding symmetry changes in each of these phases, to give chemical space groups $Cmc2_1$ and $P2_1$ respectively, while the paramagnetic phase above 40K has space group $P6_3mc$. Using GSAS, we have refined data sets from both diffractometers simultaneously, including both magnetic and structural cross-sections. Magnetoelastic coefficients for the distortions have been extracted and we have determined the sip of the coupling between the structural monoclinicity and the magnetic monoclinicity. The magnetic results from Rietveld refinement are in good agreement with model fitting to the integrated intensities of seven independent magnetic reflections and these, in turn, agree with measurements made on the same sample using the constant-wavelength reactor technique. Our results therefore validate, to some level, both the technique of using spallation sources for complicated magnetic structures and the specifics of the GSAS Rietveld code.

25216 (ORNL/FTR–4366) **[Resonant nuclear scattering seminar presentations]: Foreign trip report, August 15–25, 1992.** Tischler, J.Z. Oak Ridge National Lab., TN (United States). 9 Sep 1992. 13p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract AC05-84OR21400. Order Number DE93012408. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The purpose of this trip was to present a paper on applications of resonant nuclear scattering to the International Conference on Anomalous Scattering, Malente, Germany, and to make site visits to the University of Hamburg, Institute for Experimental Physics (II), and the Hamburg Synchrotron Radiation Laboratory (HASYLAB). An important result of the conference was the central role seen for x-ray optics at the new third-generation synchrotron light sources under construction. The site visit to the University of Hamburg Institute for Experimental Physics (II) provided a clear picture of the experimental techniques and future plans in resonant nuclear scattering of the European community. The site visit to the HASYLAB provided a valuable view of the experimental equipment developed there for energy resolved x-ray scattering.

Near-surface atoms from a Cu(001) surface were imaged using 3p photo- electron holograms. The angle-dependent electron diffraction patterns that constitute an electron hologram were Fourier transformed to create a tree dimensional, real-space image of the scattering atoms. We have made use of a multiple-wavenumber, phased summing method to improve the atom imaging capabilities of exerimental photoelectron holography using the Cu(001) proto-type system.

Specification of the atomic arrangement for axes and planes of high symmetry is essential for crystal alignment using Rutherford backscattering and for studies of the lattice location of impurities in single crystals. By rotation of an inscribed orthogonal coordinate system, a visual image for a given perspective of a crystal structure can be specified. Knowledge of the atomic arrangement permits qualitative channeling perspectives to be visualized and calculation of continuum potentials for channeling. Channeling angular-yield profiles can then be analytically modeled and, subsequently, shadowing by host atoms of positions within the unit cell predicted. Software to calculate transformed atom positions for a channeling perspective in a single crystal are described and illustrated for the spinel crystal structure.

6654 Quantum Physics Aspects of Condensed Matter

25223 (DOE/ER/45406–1) **[Research in two-dimensional critical phenomena and conformal field theory]: Final report.** Rutgers–the State Univ., New Brunswick, NJ (United States). [1990]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-89ER45406. Order Number DE93013972. Source: OSTI; NTIS; GPO Dep.

A very theoretical description is given of research in two- dimensional critical phenomena and conformal field theory. Major progress is reported in the field of fluctuating two-dimensional surfaces. A discretized representation of fluctuating geometry is used where surfaces are represented by triangulations; continuum surfaces are recovered by taking the size of the triangles to zero. One of the central goals of the theory of critical phenomena is to find all possible universality classes of n-dimensional critical phenomena; this goal has been translated into the problem of clasifying all possible scale-invariant euclidean quantum field theories. Long lengths of flexible Ag-clad Bi-2223 Superconductors have been fabricated by the powder-in-tube technique using prereacted, poly-phase, Pb-doped Bi-Sr-Ca-Cu-O powders. At liquid helium (4.2 K) temperature, improved process conditions yielded transport critical current density (J_c) values greater than 10^5 A/cm^2 at zero

field; at liquid nitrogen (77K) temperature, the J_c values of short tape samples exceeded 4×10^4 A/cm$_2$. Rolled tapes are cut into lengths up to 2 - meters long and are used in parallel to fabricate small superconducting pancake coils by the "wind-and-react" technique. The cots are characterized at 77K and 4.2 K. The J_c of the coils are up to 80% of the short, rolled sample result at 77 K. The coils exhibited these results even after being cooled and warmed several times between ambient, 77 K and 4.2 K, indicating their stability following thermal cycling.

The fabrication and first performance tests of a prototype superconducting radio-frequency quadrupole resonator (SRFQ) are described. The SRFQ operates at 57 MHz and is optimized for a particle velocity of $\beta = 0.033$. It is constructed of copper electroplated with a lead-tin alloy. An accelerating field gradient of 1.25 MV/m was achieved with about 7 watts of helium dissipation. This corresponds to an energy gain of 700 keV per unit charge over the 56 cm overall diameter of the resonator.

25226 (CONF-9209221–, pp. 89-94) **Challenges for positron analysis in materials science.** Howell, R.H. (Lawrence Livermore National Lab., CA (US)). Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

Ever since the realization that positrons thermalize in solid materials and may trap in defected ones every known interaction and annihilation property of positrons has been applied to materials analysis. These include measurement of: the positron lifetime, the angular deviation of the annihilation gamma rays, the materials controlled diffusion and trapping of implanted positrons, spectroscopies of positrons and positronium emitted from surface-vacuum interfaces, and positron analogs of electron experiments such as diffraction and Auger electron emission. At LLNL positron analysis has been integrated into the mainstream materials science program on an equal footing with other competing techniques such as angle resolved photo emission. This integration has resulted in a close coupling of positron results and general program goals. An example of this approach is seen in the results of the LLNL superconducting program where both lifetime and angular correlation measurements have been used in conjunction with transport measurements, crystal growth techniques, and other electronic structure measurements to attack a variety of problems associated with superconducting oxides. In this talk we will outline the relationship of these measurements and results to the general program outline and what role positron measurements are expected to play in future studies. These studies were conducted at LLNL facilities including the LLNL intense positron beam, the two dimensional angular correlation spectrometer, the positron lifetime laboratory and the high density positron trap. We will cover the status and future direction of the several major positron based facilities available at LLNL and the influence of the development of new techniques and other general use facilities.

25227 (CONF-9209221–, pp. 179-196) **Two dimensional ACAR measurements in high-$T_c$materials; recent results and future perspectives.** Smedskjaer, L.C. (Argonne National Lab., IL (US)). Oak Ridge National Lab., TN (United States). Apr 1993. From Department of Energy (DOE) task force meeting workshop on the application of positron spectroscopy to materials sciences; Miranch Mirage, CA (United States); 9-11 Sep 1992. In *DOE workshop meeting on the application of positron spectroscopy to materials sciences: Proceedings.* 395p. Order Number DE93012784. Source: OSTI; NTIS.

Positron Annihilation is a unique tool for materials studies and characterization. It is being extensively used as a concomitant tool for defect characterization, frequently by means of lifetime, Doppler broadening, and slow-beam techniques. A more original motivation for the positron technique is however to gain insight into the electronic structure of materials. In this regard the 2-D ACAR technique is complementary to other techniques such as dHvA and ARPES. The advent of the high-$T_c$superconductors is a strong challenge to the positron field; in the defect area the challenge is to contribute to the understanding of the defect structures, especially with a view to the future applications of the superconductors. The electronic structure field is being challenged to contribute to the comprehension of the electronic structure (e.g., strongly correlated or Fermi liquids). This talk discusses how the positron technique has contributed to the knowledge about the electronic structure. An overview of the two-dimensional angular correlation (2D-ACAR) positron annihilation results for the three fundamental phases of $YBa_2Cu_3O_x$, namely, the normal metal, the superconductor, and the insulator, is presented. Along with the c-axis projected momentum density, the recent results for the a-axis projection as well as the insulating Y123 are discussed. The experimental results are compared and contrasted with the corresponding band theory predictions for this archetypal high-$T_c$superconductor. It is emphasized that a broad consensus has been obtained among several groups concerning the experimental results and interpretations for this and other high-$T_c$materials. It is anticipated that the high-$T_c$and related materials will be of interest in the future. As an example preliminary data for BKB are discussed along with future experiments, for example in the Fullerenes and organic superconductors.

25228 (DOE/FTR–93013656) **[Travel to Japan Atomic Energy Research Institute, Tokai, Japan to observe the second DPC-EX test]: Foreign trip report, July 11–27, 1992.** Takayasu, Makoto. Massachusetts Inst. of Tech., Cambridge, MA (United States). Plasma Fusion Center. 18 Sep 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER54110. Order Number DE93013656. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The second DPC-EX test was performed. The current-sharing temperature and critical-current measurements in DC test indicated that the DPC-EX coil had about 24% degradation of critical current in comparison with that of a single strand at 7 T. The ramp rate limitation in pulsed field operation was revealed. It was generally similar to that of US-DPC; the ramp limitation currents increase with decreasing the ramp rate. However, the limiting currents of one of the double pancakes increased with increasing the ramp rate in the range of the ramp time between 0.5 s and 1.5 s. Fatigue due to pulsed operation was tested. With regard to the instability problem of the DPC-U1 & U2 it was tested to make current distribution among strands uniform by using inductive heaters. The effectiveness of the heates was proved. The DPC series tests has been completed by this EX test.

25230 (LA-UR–93-1414) **Similarity of the leading contributions to the self-energy and the thermodynamics in two- and three-dimensional Fermi Liquids.** Coffey, D.; Bedell, K.S. Los Alamos National Lab., NM (United States). [1993]. 5p. Sponsored

by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930367–4: Conference on spectroscopies in novel superconductors, Santa Fe, NM (United States), 17-19 Mar 1993). Order Number DE93012673. Source: OSTI; NTIS; INIS; GPO Dep.

We compare the self-energy and entropy of a two- and three-dimensional Fermi Liquids (FLs) using a model with a contact interaction between fermions. For a two-dimensional (2D) FL we find that there are T^2 contributions to the entropy from interactions separate from those due to the collective modes. These T^2 contributions arise from nonanalytic corrections to the real part of the self-energy and areanalogous to $T^3 \ln T$ contributions present in the entropy of a three-dimensional (3D) FL. The difference between the 2D and 3D results arises solely from the different phase space factors.

6655 Direct Energy Conversion

25231 (SAND–93-2805C) **Stagnation dynamics and heating mechanisms for wire array z-pinch implosions.** Spielman, R.B. (Sandia National Labs., Albuquerque, NM (United States)); De Groot, J.S.; Nash, T.J.; McGurn, J.; Ruggles, L.; Vargas, M.; Estabrook, K.G. Sandia National Labs., Albuquerque, NM (United States). [1993]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9304126–3: 3. international conference on dense z-pinches, London (United Kingdom), 19-23 Apr 1993). Order Number DE93012843. Source: OSTI; NTIS; GPO Dep.

We have conducted experiments with aluminum, copper, and gold wires arrays to study x-ray production, z-pinch stability, and heating mechanisms. Time-resolved x-ray pinhole camera data and PCD data clearly show that the maximum in the keV x-ray production occurs after peak compression during an expansion phase. The data are consistent with a sheath whose width is determined by the number of wires of the initial array (azimuthal uniformity) and the array diameter. The final stagnated size of the pinch is set by that sheath thickness. The stagnation event is characterized by a relatively uniform initial pinch reaching, in some cases, a diameter < 1 mm, followed by a disruption and increased x-ray production. The source of this energy is apparently not kinetic. The kinetic portion of the energy should have been converted to thermal energy near the time of maximum compression. For aluminum and copper wire arrays, heating from classical Spitzer resistivity is insufficient to explain the observed x-ray yields. While our present data does not show the actual location of current sheath nor does it give the position of non-radiating plasmas and, hence, is incomplete, the data when taken as a whole is strongly suggestive of enhanced resistive dissipation and an MHD instability with a helical shape.

The subject of atomic properties in the presence of very strong magnetic fields is experiencing a new wave of interest, especially insofar as non-hydrogenic systems are concerned, and we believe the research summarized here is on the crest of that wave. Only recently there have appeared a major review of Thomas-Fermi theory [Spruch, L. 1991, Rev. Mod. Phys. 63 151]; a new set of fundamental theorems pertaining to the Hamiltonian of a (Thomas-Fermi) atom in a strong field [Lieb E.H., Solovej J.P., Yngvason J., Phys. Rev. Lett. 69, 749 (1992)]; and the first numerical, Hartree-Fock (HF) results for multi-electron atoms in strong B fields, but obtained under the restrictive assumption that the ρ- and z-dependence of individual orbitals is completely separable [Miller M.C., Neuhauser D. Mon. Not. R. astr. Soc., 253, 107 (1991)].

25233 (DOE/ER/40333–136) **Experiments with energetic μd and μt emitted from solid hydrogen.** Marshall, G.M. (TRIUMF, Vancouver, BC (Canada)); Beveridge, J.L.; Bailey, J.M.; Beer, G.A.; Knowles, P.E.; Mason, G.R.; Olin, A.; Brewer, J.H.; Forster, B.M.; Huber, T.M.; Pippitt, B.; Jacot-Guillarmod, R.; Schellenberg, L.; Kammel, P. Wyoming Univ., Laramie, WY (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States); Natural Sciences and Engineering Research Council of Canada, Ottawa, ON (Canada). DOE Contract FG02-87ER40333. (CONF-9206276–5: Muon '92 workshop, Uppsala (Sweden), 28 Jun - 3 jul 1992). Order Number DE93010252. Source: OSTI; NTIS; INIS; GPO Dep.

A set of experiments is reviewed which makes use of the emission of muonic deuterium from the surface of a layer of solid hydrogen. The behavior of muons in a solid target system has been studied via detection of muon decay electrons, muonic x-rays, and fusion products (neutrons and charged particles). The emission of muonic deuterium is understood to result from the Ramsauer-Townsend scattering minimum. The energy distribution of the emitted atoms ranges from tenths of eV to about 10eV, and can be controlled to some extent. A proposal is described to use muonic tritium emission to measure the energy dependence of muonic molecular formation.

25234 (DOE/ER/53198–218) **Reversed-field pinch studies in the Madison Symmetric Torus.** Hokin, S.; Almagri, A.; Cekic, M.; Chapman, B.; Crocker, N.; Den Hartog, D.J.; Fiksel, G.; Henry, J.; Ji, H.; Prager, S.; Sarff, J.; Scime, E.; Shen, W.; Stoneking, M.; Watts, C. Wisconsin Univ., Madison, WI (United States). Plasma Physics Research. 3 Apr 1993. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER53198. Order Number DE93013464. Source: OSTI; NTIS; INIS; GPO Dep.

Studies of large-size ($R = 1.5$ m, $a = 0.5$ m), moderate current ($I < 750$ kA) reversed-field pinch (RFP) plasmas are carried out in the Madison Symmetric Torus in order to evaluate and improve RFP confinement, study general toroidal plasma MHD issues, determine the mechanism of the RFP dynamo, and measure fluctuation-induced transport and anomalous ion heating. MST confinement has been improved by reduction of magnetic field errors with correction coils in the primary circuit and reduction of impurities using boronization; high densities have been achieved with hydrogen pellet injection. MHD tearing modes with poloidal mode number $m = 1$ and toroidal mode numbers $n = 5$–7 are prevalent and nonlinearly couple to produce sudden relaxations akin to tokamak sawteeth. Edge fluctuation-induced transport has been measured with a variety of insertable probes. Ions exhibit anomalous heating, with increases of ion temperature occuring during strong MHD relaxation. The RFP dynamo has been studied with attention to various possible mechanisms, including motion-EMF drive, the Hall effect, and superthermal electrons. Initial profile control experiments have begun using insertable biased probes and plasma guns. The toroidal field capacity of MST will be upgraded during Summer, 1993 to allow low-current tokamak operation as well as improved RFP operation.

25235 (DOE/ER/53212–212) **Magnetohydrodynamic computation of feedback stabilization of resistive-shell instabilities in the reversed field pinch.** Zita, E.J. Wisconsin Univ., Madison, WI (United States). Plasma Physics Research. 1993. 68p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER53212. Order Number DE93013466. Source: OSTI; NTIS; INIS; GPO Dep.

MHD computations demonstrate that feedback can sustain reversal and reduce loop voltage in resistive-shell reversed field pinch (RFP) plasmas. In the absence of a close-fitting conducting shell, feedback with conducting coils $\sim 2R/a$ tearing modes resonant near axis is found to restore plasma parameters to nearly their levels with a close-fitting conducting shell. When original dynamo modes

are stabilized, neighboring tearing modes grow to maintain the RFP dynamo more efficiently. This suggests that experimentally observed limits on RFP pulselengths to the order of the shell time can be overcome by applying feedback to a few helical modes. Feedback with resistive coils yields information on requirements for more physically realistic feedback systems and on the potentiality of improvement of resistive-shell plasma parameters beyond the conducting-shell case. Plasma response to shell rotation is investigated, and issues relevant to mode locking and feedback rotation of individual modes are discussed.

25236 (DOE/ET/53088–599) **Gyrosheath near the tokamak edge.** Hazeltine, R.D. (Texas Univ., Austin, TX (United States). Inst. for Fusion Studies); Xiao, H.; Valanju, P.M. Texas Univ., Austin, TX (United States). Inst. for Fusion Studies; Texas Univ., Austin, TX (United States). Fusion Research Center. Mar 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-80ET53088. Order Number DE93012191. Source: OSTI; NTIS; INIS; GPO Dep.

A new model for the structure of the radial electric field profile in the edge during the H-mode is proposed. Charge separation caused by the difference between electron and ion gyromotion, or more importantly in a tokamak, the banana motion (halo effect) can self-consistently produce an electric dipole moment that causes the sheared radial electric field. The calculated results based on the model are consistent with D-III D and TEXTOR experimental results.

25237 (GA-A–21046) **Direct electron heating and current drive with fast waves in DIII-D.** Pinsker, R.I. (General Atomics, San Diego, CA (United States)); Petty, C.C.; Callis, R.W.; Cary, W.P.; Chiu, S.C.; Freeman, R.L.; deGrassie, J.S.; Harvey, R.W.; Luce, T.C.; Mayberry, M.J.; Prater, R.; Porkolab, M.; Bonoli, P.T.; Baity, F.W.; Goulding, R.H.General Atomics, San Diego, CA (United States). Sep 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114 ;AC05-84OR21400 ;W-7405-ENG-48. (CONF-9209290–9: 14. international conference on plasma physics and controlled nuclear fusion research, Wurzburg (Germany), 30 Sep - 7 oct 1992; IAEA-CN–56/E-2-4). Order Number DE93013028. Source: OSTI; NTIS; INIS; GPO Dep.

Experiments on the DIII-D tokamak have been performed to evaluate noninductive current drive with direct electron absorption of the fast Alfven wave (FW) in the ion cyclotron range of frequencies. These experiments have employed a 2 MW 60 NM transmitter connected to a four-element toroidally phased array of loop antennas located at the outside midplane of the DIII-D vacuum vessel. Efficient direct electron heating was obtained with (0, π, 0, π) antenna phasing; H-mode confinement was obtained with direct electron absorption of the fast wave as the sole source of auxiliary heating. Current drive experiments were performed with (0,π/2,π,3π/2) antenna phasing at fast wave power levels up to 1.2 MW. Preheating with 60 GHz ECH was used to increase the single-pass absorption of the fast wave with a directive spectrum. When the fast wave is lunched in the direction that aids the inductively driven current (co-current drive), up to 40% of the 0.4 MA plasma current is sustained noninductively. Counter-current drive strongly affects the sawtoothing behavior, and results in highly peaked electron temperature profiles ($T_e(0) \lesssim 6$ keV) but much smaller driven currents.

25238 (GA-A–21128) **An emerging understanding of H-mode discharges in tokamaks.** Groebner, R.J. General Atomics, San Diego, CA (United States). Dec 1992. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. (CONF-921103–10: Meeting of the Division of Plasma Physics of the American Physical Society, Seattle, WA (United States), 16-20 Nov 1992). Order Number DE93012829. Source: OSTI; NTIS; INIS; GPO Dep.

A remarkable degree of consistency of experimental results from tokamaks throughout the world has developed with regard to the phenomenology of the transition from L-mode to H-mode confinement in tokamaks. The transition is initiated in a narrow layer at the plasma periphery where density fluctuations are suppressed and steep gradients of temperature and density form in a region with large first and second radial derivatives in the $v_E^{\rightarrow} = (E \times B)/B^2$ flow velocity. These results are qualitatively consistent with theories which predict suppression of fluctuations by shear or curvature in vE. The required vE flow is generated very rapidly when the magnitude of the heating power or of an externally imposed radial current exceed threshold values and several theoretical models have been developed to explain the observed changes in the vE flow. After the transition occurs, the altered boundary conditions enable the development of improved confinement in the plasma interior on a confinement time scale. The resulting H-mode discharge has typically twice the confinement of L-mode discharges and regimes of further improved confinement have been obtained in some H-mode scenarios.

25239 (GA-A–21254) **Efficiency of fast wave current drive for a weakly relativistic plasma.** Chiu, S.C. (General Atomics, San Diego, CA (United States)); Lin-Liu, Y.R.; Karney, C.F.F. General Atomics, San Diego, CA (United States). Apr 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114 ;AC02-76CH03073. (CONF-9304112–4: 10. topical conference on radio frequency power in plasmas, Boston, MA (United States), 1-3 Apr 1993). Order Number DE93012775. Source: OSTI; NTIS; INIS; GPO Dep.

Current drive by fast waves (FWCD) is an important candidate for steady-state operation of tokamaks. Major experiments using this scheme are being carried out on DIII-D. There has been considerable study of the theoretical efficiency of FWCD. In Refs. 4 and 5, the nonrelativistic efficiency of FWCD at arbitrary frequencies was studied. For DIII-D parameters, the results can be considerably different from the Landau and Alfven limits. At the high temperatures of reactors and DIII-D upgrade, relativistic effects become important. In this paper, the relativistic FWCD efficiency for arbitrary frequencies is studied. Assuming that the plasma is weakly relativistic, i.e., T_e/Mc^2 is small, an analytic expression for FWCD is obtained for high resonant energies ($U_{ph}/u_{Te} \gg$). Comparisons with the results from a numerical code ADJ and the nonrelativistic results shall be made and analytical fits in the whole range of velocities shall be presented.

25240 (GA-A–21258) **Statistical approach to LHCD modeling using the wave kinetic equation.** Kupfer, K. (General Atomics, San Diego, CA (United States)); Moreau, D.; Litaudon, X. General Atomics, San Diego, CA (United States). Apr 1993. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89ER51114. (CONF-9304112–5: 10. topical conference on radio frequency power in plasmas, Boston, MA (United States), 1-3 Apr 1993). Order Number DE93012831. Source: OSTI; NTIS; INIS; GPO Dep.

Recent work has shown that for parameter regimes typical of many present day current drive experiments, the orbits of the launched LH rays are chaotic (in the Hamiltonian sense), so that wave energy diffuses through the stochastic layer and fills the spectral gap. We have analyzed this problem using a statistical approach, by solving the wave kinetic equation for the coarse-grained spectral energy density. An interesting result is that the LH absorption profile is essentially independent of both the total injected power and the level of wave stochastic diffusion.

25241 (INDC(NDS)–202/GA) **7. meeting of the Atomic and Molecular Data Centre Network, Oak Ridge National Laboratory, Oak Ridge, TN, 9-11 November 1987: Summary report.** Smith, J.J. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Feb 1988. [54p.] (CONF-8711366–: 7. meeting of the Atomic and Molecular Data Centre Network, Oak Ridge, TN (United States), 9-11 Nov 1987). Order Number DE93626599. Source: OSTI; NTIS (US Sales Only); INIS.

This is a brief summary report of the Seventh Atomic and Molecular Data Centre Network Meeting convened by the IAEA at the Oak Ridge National Laboratory, Oak Ridge, Tennessee, 9-11 November 1987. The goal of the Centre is to provide coordination of the international management of atomic and molecular data pertinent to controlled fusion research and technology. The meeting was attended by twelve representatives of centres from six member states. The meeting resulted in five conclusions: (i) the establishment of a single international atomic and molecular collision data base was stressed to be the short-term priority for the data centre network; (ii) the Specialists' Meeting on "Atomic and Molecular Data for Plasma Edge Studies" was reviewed, and the proposal for

the formation of a coordinated research programme on the production and evaluation of atomic and molecular data for plasma edge studies as a means of generating the needed data for fusion research was endorsed; (iii) it was recommended that the recent report entitled "Recommended Data on Atomic Collision Processes Involving Iron Ions" be published as a special supplement to the Nuclear Fusion journal, 1987. This unit was asked to investigate the possibility to provide data covering recombination processes for iron ions which were not included in the recommended data base; (iv) the participants felt that a meeting covering the Atomic and Molecular and fusion data base was timely and important for maximizing the efficient usage of the Atomic and Molecular collision data base. The convening of a Specialists' Meeting on carbon and oxygen ion collision data was also discussed. Finally, (v) it was proposed that the Atomic and Molecular Data Unit should fully address all discrepancies within the recommended data base. Nine status and progress reports are summarized in the Appendices to the present summary report. Refs, 1 fig., tabs.

Source: OSTI; NTIS (US Sales Only); INIS.

The Summary Report of the IAEA Consultants' Meeting on the "Atomic Data Base and Fusion Applications Interface" held at the IAEA Headquarters in Vienna on May 9-13, 1988, is provided. The Report contains a brief review of the meeting proceedings, and the reports of the Working Groups on the A and M dictionary (labelling/indexing system) and on the data storage and exchange system. The conclusions and recommendations of the meeting are also summarized. (author). Figs and tabs.

25251 (INDC(NDS)–225/MS) **IAEA specialists' meeting on required atomic database for neutral beam penetration in large tokamaks: Summary report.** Janev, R.K. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jul 1989. [43p.] (CONF-8904446–: IAEA specialists' meeting on required atomic database for neutral beam penetration in large tokamaks, Vienna (Austria), 10-12 Apr 1989). Order Number DE93627110. Source: OSTI; NTIS (US Sales Only); INIS.

This Summary Report contains the proceedings, conclusions and recommendations of the Specialists' Meeting on the "Required Atomic Database for Neutral Beam Penetration in Large Tokamaks" convened on 10-12 April 1989, at the IAEA Headquarters in Vienna, Austria, by the IAEA Atomic and Molecular Data Unit. The existing database for collisions of energetic hydrogen atoms with electron, protons and plasma impurity ions, as well as the new results presented at the Meeting were critically analyzed, the accuracies of the data were assessed, and recommendations were given regarding the best set of available cross section data to be used in neutral beam penetration codes.

25252 (INDC(NDS)–225/MS, pp. 5-9) **Working group report on the required atomic database for neutral hydrogen beam penetration in large tokamaks.** Cox, M.; Boley, C.D.; Janev, R.K. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jul 1989. (CONF-8904446–: IAEA specialists' meeting on required atomic database for neutral beam penetration in large tokamaks, Vienna (Austria), 10-12 Apr 1989). In *IAEA specialists' meeting on required atomic database for neutral beam penetration in large tokamaks: Summary report.* [43p.] Order Number DE93627110. Source: OSTI; NTIS (US Sales Only); INIS.

This report discusses the required atomic database for the physical processes involved in the beam attenuation kinetics, when multistep processes are included, i.e., electron and proton impact processes, impurity-ion impact processes, radiative processes, as well as Lorentz field ionization. It also discusses the required accuracies of different parts of the data base in order to achieve the overall accuracy of about 10 percent that is required for the total beam stopping power cross section. 3 refs.

25253 (INDC(NDS)–225/MS, pp. 10-17) **Working group report on electron-impact processes: Recommended database for electron impact excitation and ionization.** Heer, F.J. de; Janev, R.K.; Smith, J.J. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jul 1989. (CONF-8904446–: IAEA specialists' meeting on required atomic database for neutral beam penetration in large tokamaks, Vienna (Austria), 10-12 Apr 1989). In *IAEA specialists' meeting on required atomic database for neutral beam penetration in large tokamaks: Summary report.* [43p.] Order Number DE93627110. Source: OSTI; NTIS (US Sales Only); INIS.

The cross section database for electron impact excitation and electron impact ionization for hydrogen beam kinetic energies greater than 100 eV was considered, giving for each particular process a reference to a recommended publication of cross sections, as well as the accuracy or estimated accuracy. The work is motivated by the application of neutral beam injection in magnetic confinement devices, such as large tokamaks. 9 refs, 2 figs.

25254 (INDC(NDS)–225/MS, pp. 19-27) **Working group report on ion-impact excitation: Recommended database for ion-impact excitation of atomic hydrogen.** Fritsch, W.; Olson, R.E.; Schartner, K.H.; Belkic, D.S. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jul 1989. (CONF-8904446–: IAEA specialists' meeting on required atomic database for neutral beam penetration in large tokamaks, Vienna (Austria), 10-12 Apr 1989). In *IAEA specialists' meeting on required atomic database for neutral beam penetration in large tokamaks: Summary report.* [43p.] Order Number DE93627110. Source: OSTI; NTIS (US Sales Only); INIS.

This report discusses (i) proton impact excitation, and (ii) excitation by ion collisions (from helium ions to iron ions) of atomic hydrogen, both for H(1s) and H(n>1), where where n = the principal quantum number, in the energy range from 1 keV/amu to 2 MeV/amu and 10 MeV/amu, respectively. For the range of ions considered, a few generic plots are given for the total cross section as a function of E/q, where E is the beam energy, for different values q (ion charge in units of proton charge) and different final principal quantum numbers. 12 refs, 3 figs.

25255 (INDC(NDS)–225/MS, pp. 29-33) **Working group report on electron removal: Recommended database for charge exchange and ionization.** Gilbody, H.B.; Crothers, D.S.F.; Szucs, S. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jul 1989. (CONF-8904446–: IAEA specialists' meeting on required atomic database for neutral beam penetration in large tokamaks, Vienna (Austria), 10-12 Apr 1989). In *IAEA specialists' meeting on required atomic database for neutral beam penetration in large tokamaks: Summary report.* [43p.] Order Number DE93627110. Source: OSTI; NTIS (US Sales Only); INIS.

The available data on (i) collisions of protons with hydrogen atoms (both charge exchange and ionization) and (ii) collisions of fully stripped plasma impurity ions with hydrogen atoms are discussed with regard to recommendations for a database applicable to neutral atom beam injection in magnetic confinement devices. 11 refs, 1 fig.

25256 (INDC(NDS)–236/M5) **IAEA advisory group meeting on atomic and molecular data for metallic impurities in fusion plasmas: Summary report.** Janev, R.K. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jul 1990. [25p.] (CONF-9005397–: IAEA Advisory Group meeting on atomic and molecular (A and M) data for metallic impurities in fusion plasmas: Collision processes of metallic ions in fusion plasmas, Vienna (Austria), 16-18 May 1990;. Order Number DE93624938. Source: OSTI; NTIS (US Sales Only); INIS.

The present Report contains the Summary of the IAEA Advisory Group Meeting on "Atomic and Molecular Data for Metallic Impurities in Fusion Plasmas" which was organized by the IAEA Atomic and Molecular Data Unit and held on May 16-18, 1990 in Vienna, Austria. The Meeting Proceedings are briefly described and the Working Group Reports on electron impact and heavy particle collisions are reproduced. The meeting conclusions regarding the data status and the recommendations for future IAEA activities in this data area are also included. (author). Refs and tabs.

25257 (INDC(NDS)–253/N2) **IAEA consultants' meeting on He-beam data base for alpha particle diagnostics of fusion plasmas: Summary report.** Janev, R.K. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jan 1992. [55p.] (CONF-9106429–: IAEA consultants' meeting on He-beam data base for alpha particle diagnostics fo fusion plasmas, Vienna (Austria), 3-5 Jun 1991). Order Number DE93626995. Source: OSTI; NTIS (US Sales Only); INIS.

The present Report contains the Summary of the IAEA Consultants' Meeting on "He-Beam Data Base for Alpha Particle Diagnostics of Fusion Plasmas" which was organized by the Atomic and Molecular Data Unit and held on June 3-5, 1991 at the IAEA Headquarters in Vienna, Austria. The Meeting Proceedings are briefly described and the reports of the Working Groups on the

electron- and ion-impact processes are reproduced. A survey on the atomic data needs and required cross section accuracies for helium beam stopping calculations and alpha particle diagnostics of JET- and ITER-like plasmas is included. The conclusions and recommendations of the Meeting regarding the status of present data base (availability and quality) and the needs for its improvement are also given in this Summary Report. (author). Refs, figs and tabs.

25258 (INDC(NDS)–253/N2, pp. 13-19) **Survey of atomic data base needs and accuracies for helium beam stopping and alpha particle diagnostics for ITER.** Summers, H.P.; Hellermann, M. von. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jan 1992. (CONF-9106429–: IAEA consultants' meeting on He-beam data base for alpha particle diagnostics fo fusion plasmas, Vienna (Austria), 3-5 Jun 1991). In *IAEA consultants' meeting on He-beam data base for alpha particle diagnostics of fusion plasmas: Summary report.* [55p.] Order Number DE93626995. Source: OSTI; NTIS (US Sales Only); INIS.

This report is concerned with establishing a recommended collection of atomic collision data for the modelling, experimental investigation and exploitation of helium beams. The motivation stems from proposals for diagnostic beams for the ITER tokamak, targeted at alpha particle measurement via double charge transfer, neutralized alpha particle analysis and spectroscopic analysis of recombination radiation. The report discusses the beam energies, species involved in collisions with the helium atom beam (fuel, helium ash and plasma impurities) and plasma conditions prevailing in large tokamak devices. It also lists the required cross-section data.

25259 (INDC(NDS)–254) **IAEA consultants' meeting on atomic data base for Be and B: Summary report.** Janev, R.K. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Sep 1991. [36p.] (CONF-9106430–: IAEA consultants' meeting on atomic data base for Be and B, Vienna (Austria), 10-12 Jun 1991). Order Number DE93626996. Source: OSTI; NTIS (US Sales Only); INIS.

This Summary Report contains the proceedings, conclusions and recommendations of the IAEA Consultants' Meeting on the "Atomic Data Base for Be and B" organized by the Agency's Atomic and Molecular Data Unit, and convened on June 10-12, 1991, at the IAEA Headquarters in Vienna, Austria. The existing collisional data base for these plasma impurities was thoroughly analyzed and critically evaluated at the Meeting. Many new, original results for both electron-impact and heavy-particle collisions of Be and B ions were reported at the Meeting, contributing significantly to the completion of the data base. The data analysis (including assessment of accuracies) and the recommendations of the Meeting regarding the best available collisional data for these impurities are given in two working Group Reports reproduced in this Summary Report. Analytic fits to the recommended electron-impact ionization cross section, prepared by Dr. D.L. Moores after the meeting, are also included in the present Report. (author). Refs, figs and tabs.

25260 (INDC(NDS)–254, pp. 31-36) **Analytic fits of the recommended electron impact ionization cross sections for Be and B ions and atoms.** Moores, D.L. (University Coll., London (United Kingdom). Dept. of Physics and Astronomy). International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Sep 1991. (CONF-9106430–: IAEA consultants' meeting on atomic data base for Be and B, Vienna (Austria), 10-12 Jun 1991). In *IAEA consultants' meeting on atomic data base for Be and B: Summary report.* [36p.] Order Number DE93626996. Source: OSTI; NTIS (US Sales Only); INIS.

Short communication. ELECTRON-ATOM COLLISIONS/cross sections; ELECTRON-ION COLLISIONS/beryllium ions; ELECTRON-ION COLLISIONS/boron ions; ELECTRON-ION COLLISIONS/cross sections; ANALYTIC FUNCTIONS; EVALUATED DATA; IONIZATION; METASTABLE STATES

25261 (INDC(NDS)–255) **Radiative losses and electron cooling rates for carbon and oxygen plasma impurities.** Marchand, R. (Institut National de la Recherche Scientifique (INRS), Varennes (Canada)); Bonnin, X. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jan 1992. [64p.] Order Number DE93627111. Source: OSTI; NTIS (US Sales Only); INIS.

Radiative losses and electron cooling rates are calculated for carbon and oxygen ions under conditions relevant to fusion plasmas. Both rates are calculated with the most recent recommended atomic data. A modified coronal model which includes the effects of metastable states is described and used to calculate the rates. Comparisons with other approaches are also discussed. (author). 36 ref, figs.

25262 (INDC(NDS)–257/N8) **IAEA advisory group meeting on atomic and molecular data for fusion plasma impurities: Summary report.** Janev, R.K. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Feb 1992. [42p.] (CONF-9109485–: IAEA advisory group meeting on atomic and molecular data for fusion plasma impurities, Vienna (Austria), 25-27 Sep 1991). Order Number DE93627112. Source: OSTI; NTIS (US Sales Only); INIS.

This Summary Report briefly summarizes the proceedings, conclusions and recommendations of the IAEA Advisory Group Meeting on "Atomic and Molecular Data for Fusion Plasma Impurities", held at the IAEA Headquarters in Vienna on 25-27 September 1991. The reports of the two Meeting Working Groups regarding the data status and needs for spectroscopic and collisional data on plasma impurities are also included. Refs, figs and tabs.

25263 (INDC(NDS)–257/N8, pp. 11-19) **Spectroscopic and electron-ion collision data for plasma impurities.** Faenov, A.; Marchand, R.; Tawara, H.; Vainshtein, L.; Wiese, W. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Feb 1992. (CONF-9109485–: IAEA advisory group meeting on atomic and molecular data for fusion plasma impurities, Vienna (Austria), 25-27 Sep 1991). In *IAEA advisory group meeting on atomic and molecular data for fusion plasma impurities: Summary report.* [42p.] Order Number DE93627112. Source: OSTI; NTIS (US Sales Only); INIS.

This Working Group Report briefly reviews and summarizes the available spectroscopic and electron-ion collision data for plasma impurities. Included are lithium, neon, and argon, which, although they are not plasma impurities per se, are introduced into the plasma through the application of diagnostic techniques. 32 refs, 2 tabs.

25264 (INDC(NDS)–257/N8, pp. 20-24) **Working group report on atomic data status and needs concerning plasma impurities colliding with H, H_2 and He.** Schultz, D.R. 25267 (INIS-mf–13512) **The magnetic field structure of Rotamak discharges.** Durance, G. Flinders Univ. of South Australia, Bedford Park, SA (Australia). Oct 1983. [212p.] Order Number DE93623062. Source: OSTI; NTIS (US Sales Only); INIS.

This thesis describes an experimental study of a field-reversed compact torus configuration which is generated and sustained by a rotating magnetic field. Earlier studies of this so-called 'rotamak' concept used rotating magnetic fields of limited duration ($\approx$15 μs). The rotating magnetic field is produced by feeding RF currents, dephased by 90 deg., through two orthogonal Helmholtz coils which are wound around the outside of a spherical Pyrex vacuum vessel. Line generators are used to supply the RF current pulses. Experiments are performed using an argon plasma. From measurements of the driven toroidal current, two rotamak operating modes are identified. Detailed poloidal flux contour measurements prove that these modes are associated with either a closed magnetic field line, compact torus configuration or an open magnetic field line, mirror-like structure. In the compact torus configuration the driven toroidal current is shown to vary linearly with the magnitude of the externally applied equilibrium field. For the same initial conditions of filling pressure and externally applied equilibrium field, the plasma discharges are highly reproducible. The magnetic structures of the discharges are studied in detail for three such sets of initial conditions. In particular, poloidal flux contours are derived for each of the three conditions. Although no toroidal magnetic field is externally imposed in these experiments, under certain conditions a toroidal field is observed to be present. The toroidal field is in opposite directions in the upper and lower halves of the minor cross section. Measurements of the input power into the plasma show that this power is largely determined by the characteristics of the line-generators. The variation of this input power with time can explain all the features observed in the plasma discharges. The effects of a conducting 'shell' around the vacuum vessel are also investigated. 97 refs., 72 figs., ills.

25268 (INIS-RU–343, pp. 71-73) **Acceleration of power pulse ion beams in plasma-filled magnetic channels.** Kiyashko, V.A. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst.); Kornilov, E.A.; Gorban', A.M. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i; AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. 1991. [80p.] (In Russian). In *Nuclear-physical researches (Theory and experiment): Scientific-technical collection.* Order Number DE93626131. Source: OSTI; NTIS (US Sales Only); INIS.

When high-current ion beams are accelerated in plasma-filled gaps with magnetic channels, it is important to study the efficiency of electron magnetic isolation in such systems. Electron-ion current ratio in an axially symmetric accelerating gap is considered quantitatively for this purpose. Proceeding from the analysis of charged particle motion under accelerating voltages equal to or exceeding several hundred kilovolts, it is shown that ion beam current and full current of the accelerating gap with a magnetic channel can be intercomparable. This feature is in agreement with the results of numerical simulation and experimental data. 10 refs.; 2 figs.

25269 (IPF–91-3) **Diagnostics and modelling of ECRH microwave discharges.** Behringer, K. Stuttgart Univ. (Germany). Inst. fuer Plasmaforschung. Mar 1991. 29p. Order Number DE93795225. Source: OSTI; NTIS (US Sales Only); INIS.

Stationary plasmas in various gases were generated at pressures of some 10 Pa in weak magnetic fields by microwave heating. Quantitative spectroscopy of atomic lines and molecular bands was applied for diagnostic of plasmas in hydrogen, nitrogen, methane and argon-helium mixtures. Simple model calculations were based on the well-known balance equations of glow discharges including chemical reactions especially for methane. Some tests were also performed in nitrogen glow discharges. Excitation, ionisation and dissociation rate coefficients for diagnostic or modelling purposes were taken from nuclear fusion research of calculated from experimental cross sections assuming a Maxwellian energy distribution. The electron temperatures of the discharges, predicted from electron confinement times and ionisation rate coefficients ($\simeq$ 1-4 eV), were well confirmed by the experiment. Due to additional energy losses into vibrational excitation and dissociation, there is a substantial difference in plasma size between atomic and molecular plasmas at given input power. The electron density in molecular plasmas was of the order of the cut-off density, i.e. $\simeq 10^{11}$ cm^{-3}, almost independent of the pressure. The kinetic temperature of the heavy particles was determined form N_2 band rotational intensity distribution ($\simeq$ 500 K), while the rotational temperature of CH bands and the hydrogen gas temperature are higher - a proof of energy gain during CH_4 dissociation. Hydrogen and CH densities were measured in methane plasmas by adding a small amount of argon and comparing H_α and CH molecular bands to Ar line intensities. H and CH particle densities were also derived from model calculations using electron dissociation rate coefficients and respective confinement times for the dissociation products. Some neutral-neutral reactions were also included. (orig./KP).

25270 (IPPCZ–323) **Static characteristics of a conduction and radiation dominated electric arc in nitrogen.** Jenista, J. Ceskoslovenska Akademie Ved, Prague (Czech Republic). Ustav Fyziky Plazmatu. Jul 1992. [37p.] Order Number DE93627106. Source: OSTI; NTIS (US Sales Only); INIS.

The time-dependent energy and circuit equations are solved numerically to obtain temperature profiles, current-voltage characteristics and electric field strength vs. axis temperature diagrams in the asymptotic region of a wall-stabilized electric arc operated in nitrogen. The numerical calculations demonstrate the splitting of the rising branch of the stationary solutions in the current-voltage characteristic. This phenomenon was earlier found experimentally for air. The computations were made for various channel radii and for various series resistances. The steady-state characteristics and convergence to the single branch of solutions is explained on the basis of the linearized Lyapunov stability theory (LIST). Comparison with available results of other authors shows that the analytical solution based on simple polynomial approximation to thermodynamic and transport functions differs significantly from numerical computations. (author) 20 figs., 21 refs.

25271 (JAERI-M–92-178) **Tokamak plasma power balance calculation code (TPC code) outline and operation manual.** Fujieda, Hirobumi (Atomic Data Service, Tokai, Ibaraki (Japan)); Murakami, Yoshiki; Sugihara, Masayoshi. Japan Atomic Energy Research Inst., Tokyo (Japan). Nov 1992. 139p. (In Japanese). Order Number DE93797464. Source: OSTI; NTIS; INIS.

This report is a detailed description on the TPC code, that calculates the power balance of a tokamak plasma according to the ITER guidelines. The TPC code works on a personal computer (Macintosh or J-3100/IBM-PC). Using input data such as the plasma shape, toroidal magnetic field, plasma current, electron temperature, electron density, impurities and heating power, TPC code can determine the operation point of the fusion reactor (Ion temperature is assumed to be equal to the electron temperature). Supplied flux (Volt · sec) and burn time are also estimated by coil design parameters. Calculated energy confinement time is compared with various L-mode scaling laws and the confinement enhancement factor (H-factor) is evaluated. Divertor heat load is predicted by using simple scaling models (constant-χ, Bohm-type-χ and JT-60U empirical scaling models). Frequently used data can

be stored in a 'device file' and used as the default values. TPC code can generate 2-D mesh data and the POPCON plot is drawn by a contour line plotting program (CONPLT). The operation manual about CONPLT code is also described. (author).

25272 (JAERI-M–93-004) **'AEOLUS-IT' MHD simulation code based on a toroidally incompressible plasma model.** Kurita, Gen-ichi (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Azumi, Masafumi; Takeda, Tatsuoki. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1993. 57p. (In Japanese). Order Number DE93788461. Source: OSTI; NTIS; INIS.

Three dimensional toroidal MHD code 'AEOLUS-IT' has been developed, on a basis of the new reduced set of resistive MHD equations with the assumption of toroidal incompressibility instead of the tokamak ordering in the conventional reduced set of resistive MHD equations. The code can carry out an overall MHD calculation with the effect of finite plasma resistivity, linear and nonlinear, of low aspect ratio and low-q tokamak because the basic equations include the ideal m = 1 mode. The implicit time integration scheme for the linear term of the perturbation is employed, dividing the variables into the equilibrium and perturbation parts. The huge CPU time due to solution of the large matrix can be reduced by high efficiency of vectorialization. The linear calculations, an eigenvalue problem, show the linear growth rates of ideal m = 1 mode and show the comparison of the growth rates between cylindrical and toroidal configurations of low-q tokamak. The linear calculations and nonlinear simulations of resistive ballooning modes are carried out and the both results are in good agreement with those obtained by the toroidal MHD code 'AEOLUS-RT' using the conventional reduced MHD equations. The linear and nonlinear calculations of tearing mode for the numerical equilibrium are also carried out and the almost the same results are obtained as the one obtained using the analytical equilibrium of almost the same parameters. (author).

25273 (LA-UR–93-1382) **MHD simulation of deuterium-fiber-initiated Z-pinches with two-fluid effects.** Sheehey, P. (California Univ., Los Angeles, CA (United States). Dept. of Physics); Lindemuth, I.R. Los Alamos National Lab., NM (United States). [1993]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9304126–1: 3. international conference on dense z-pinches, London (United Kingdom), 19-23 Apr 1993). Order Number DE93012682. Source: OSTI; NTIS; GPO Dep.

Two-dimensional "cold-start" resistive MHD computations of formation and evolution of deuterium-fiber-initiated Z-pinches have been extended to include separate ion and electron energy equations and finite-Larmor-radius ordered terms. In the Ohm's Law (magnetic field evolution) equation, Hall and diamagnetic pressure terms have been added, and corresponding terms have been added to the energy equations. Comparison is made of the results of these computations with previous computations and with experiments.

25274 (LA-UR–93-1393) **Two-dimensional simulations of foil implosion experiments on the Los Alamos capacitor bank.** Peterson, D.L.; Bowers, R.L.; Brownell, J.H.; Greene, A.E.; Lee, H.; Matuska, W. Los Alamos National Lab., NM (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9304126–7: 3. international conference on dense z-pinches, London (United Kingdom), 19-23 Apr 1993). Order Number DE93012676. Source: OSTI; NTIS; GPO Dep.

A number of z-pinch experiments have been conducted at Los Alamos on the Pegasus capacitor bank in which 2-cm high, 5-cm radius, thin foil loads were imploded with currents in excess of 3 MA. Two-dimensional radiation magnetohydrodynamic (RMHD) simulations of these implosions have been performed to model the implosion dynamics and subsequent generation of an x-ray pulse. Comparison of the simulation instability development with visible light framing camera photographs show good agreement and illustrate the instability evolution from short to long wavelengths and a final disruption of the imploding plasma shell. The calculations also show good agreement with experimental timing and measured current and voltage waveforms, and also reproduce features characteristic of the x-ray output. These include a broad pulsewidth, and thepresence of multiple peaks and small time scale structures, features which cannot be reproduced by one-dimensional models. X-ray spectra obtained from the calculated pinch also reproduce qualitative features inthe measured spectra.

25275 (LRP–471/93) **On absorption of low frequency electromagnetic fields.** Brunner, S. (Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP)); Vaclavik, J. Ecole Polytechnique Federale, Lausanne (Switzerland). Centre de Recherche en Physique des Plasma (CRPP). Mar 1993. [13p.] Order Number DE93627089. Source: OSTI; NTIS; INIS.

The drift kinetic equation (DKE) is used to establish a formula for power absorption of small amplitude, low frequency electromagnetic (EM) fields in a hot toroidal axisymmetric plasma. The stationary plasma is first considered. Electrons and ions are described by local Maxwellian distributions, alpha particles by a local slowing-down distribution. The fluctuating part of the distribution function for each species is then evaluated from the linearized DKE in terms of the EM fields using a perturbation method. The parameter $b_p=B_p/B_o$, where B_p is the poloidal component of the magnetostatic field B_o, and the parameter $v_d/\lambda\omega$, where v_d is the magnetic curvature drift, λ the wavelength perpendicular to B_o and ω the frequency of the EM fields, are considered to be small. By integrating the resulting distribution function over velocity space, an explicit formula for the power absorbed by each species is obtained. To obtain an expression suitable for direct implementation in an ideal-MHD code, the electric field component parallel to the magnetostatic field is evaluated using the quasi-neutrality equation. (author) 4 refs.

25276 (ORNL/TM–12209) **Transport mechanisms acting in toroidal devices: A theoretician's view.** Carreras, B.A. Oak Ridge National Lab., TN (United States). Jan 1993. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93013463. Source: OSTI; NTIS; INIS; GPO Dep.

Understanding the basic mechanisms of transport in toroidal confinement devices remains one of the more challenging scientific issues in magnetic confinement. At the same time, it is a critical issue for the magnetic fusion program. Recent progress in understanding fluctuations and transport has been fostered by the development and use of new diagnostics, bringing new perspectives on these studies. This has stimulated new theoretical developments. A view of the most recent issues and progress in this area is given. The role of long wavelengths in core transport and the relation between shear flows and turbulence at the plasma edge are the primary topics considered.

25278 (PPPL–2890) **ICRF heating on TFTR-effect on stability and performance.** Wilson, J.R.; Bell, M.G.; Biglari, H.; Bitter, M.; Bretz, N.L.; Budny, R.; Chen, L.; Darrow, D.; Efthimion, P.C.; Fredrickson, E.; Fu, G.Y.; Grek, B.; Grisham, L.R.; Hammett, G.; Hawryluk, R.J.; Hosea, J.C.; Janos, A.; Jassby, D.; Jobes, F.C.; Johnson, D.WPrinceton Univ., NJ (United States). Plasma Physics Lab. Mar 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. (IAEA-CN–56/E-2-2;CONF-920913–28: 14. international conference on plasma physics and controlled nuclear fusion research, Wuerzburg (Germany), 30 Sep - 7 oct 1992). Order Number DE93011496. Source: OSTI; NTIS; INIS; GPO Dep.

With the addition of two new antennas and two radiofrequency (RF) generators, the TFTR ICRF system is complete. The total complement of four antennas and six generators is designed for 12.5 MW operation. Experiments with this system have been performed recently on TFTR in the low recycling regime to increase the performance of supershot plasmas, in a non-resonant regime to explore electron heating, and in high recycling discharges with energetic ion tails to simulate fusion alpha particles. Noteworthy results include: direct electron heating observed with absorption rates in agreement with theory; electron heating of supershot plasmas (ΔTEO $\sim$ 2 key) via energetic ion tails that would increase the pressure of the alpha particles in DT plasmas; and the first observation of the toroidal Alfven eigenmode (TAE) instability driven by the energetic ion tail in hydrogen minority heating.

25279 (PPPL–2891) **Charged fusion product and fast ion loss in TFTR.** Zweben, S.J. (Princeton Univ., NJ (United States). Plasma Physics Lab.); Darrow, D.S.; Fredrickson, E.D.; Mynick, H.E.; White, R.B.; Biglari, H.; Bretz, N.; Budny, R.; Bush, C.E.; Chang, C.S.; Chen, L.; Cheng, C.Z.; Fu, G.Y.; Hammett, G.W.; Hawryluk, R.J.;Princeton Univ., NJ (United States). Plasma Physics Lab. Mar 1993. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. (IAEA-CN–56/A-6-3;CONF-920913–29: 14. international conference on plasma physics and controlled nuclear fusion research, Wuerzburg (Germany), 30 Sep - 7 oct 1992). Order Number DE93011494. Source: OSTI; NTIS; INIS; GPO Dep.

Several different fusion product and fast ion loss processes have been observed in TFTR using an array of pitch angle, energy and time resolved scintillator detectors located near the vessel wall. For D-D fusion products (3 MeV protons and 1 MeV tritons) the observed loss is generally consistent with expected first-orbit loss for Ip < 1.4 MA, except near the outer midplane where stochastic TF ripple loss dominates when Ip > I MA. However, at higher currents, Ip = 1.4–2.5 MA, an NM induced D-D fusion product loss can be up to 3-4 times larger than the first-orbit loss, particularly at high beam powers, P $\geq$ 25 MW. The MHD induced loss of 100 KeV neutron beam ions and ~0.5 MeV ICRF minority tail tons has also been measured $\leq$ 459 below the outer midplane. be potential implications of these results for D-T alpha particle experiments in TFTR and ITER are described.

25280 (PPPL–2893) **X-ray diagnostics of tokamak plasmas.** Bitter, M.; Hsuan, H.; Hill, K.W.; Zarnstorff, M. Princeton Univ., NJ (United States). Plasma Physics Lab. Apr 1993. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. (CONF-920963–2: 4. international colloquium on atomic spectra and oscillator strengths for astrophysics and laboratory plasmas, Gaithersburg, MD (United States), 14-17 Sep 1992). This paper discusses the influence that salinity has on the bioavailability of the two largest classes of contaminants, trace metals and organic compounds will be discussed. Although data on contaminant toxicity will be used to draw inferences about chemical availability, this discussion will focus on the properties that contaminants are likely to exhibit in waters of varying salinities. In addition, information on physiological changes that are affected by salinity will be used to illustrate how biological effects can alter the apparent availability of contaminants.

25281 (PPPL–2896) **Achieving high fusion reactivity in high poloidal beta discharges in TFTR.** Manuel, M.E. (Columbia Univ., New York, NY (United States). Dept. of Applied Physics); Navratil, G.A.; Sabbagh, S.A.; Batha, S.; Bell, M.G.; Bell, R.; Budny, R.V.; Bush, C.E.; Cavallo, A.; Chance, M.S.; Cheng, C.Z.; Efthimion, P.C.; Fredrickson, E.D.; Fu,.Princeton Univ., NJ (United States). Plasma Physics Lab. Apr 1993. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073 ;FG02-90ER54084 ;FG02-89ER53297. (IAEA-CN–56/A-III-4;CONF-9210315–4: 14. international conference on plasma physics and controlled nuclear fusion research, Wurzburg (Germany), Oct 1992). Order Number DE93011980. Source: OSTI; NTIS; INIS; GPO Dep.

High poloidal beta discharges have been produced in TFTR that achieved high fusion reactivities at low plasma currents. By rapidly decreasing the plasma current just prior to high-power neutral beam injection, relatively peaked current profiles were created having high $l_i > 2$, high Troyon-normalized beta, $\beta N > 3$, and high poloidal beta. $\beta_p \geq 0.7$ R/a. The global energy confinement time after the current ramp was comparable to supershots, and the combination of improved MHD stability and good confinement produced a new high $\epsilon\beta_p$ high Q_{DD} operating mode for TFTR. Without steady-state current profile control, as the pulse lengths of high βp discharges were extended, l_i decreased, and the improved stability produced immediately after by the current ramp deteriorated. In four second, high $\epsilon\beta_p$ discharges, the current profile broadened under the influence of bootstrap and beam-drive currents. When the calculated voltage throughout the plasma nearly vanished, MHD instabilities were observed with β_N as low as 1.4. Ideal MHD stability calculations showed this lower beta limit to be consistent with theoretical expectations.

25282 (Riso-R–659(EN)) **Electrostatic turbulence in strongly magnetized plasmas.** Nielsen, A.H. Risoe National Lab., Roskilde (Denmark). Optics and Fluid Dynamics Dept.; Danmarks Tekniske Hoejskole, Lyngby (Denmark). Jan 1993. [81p.] Order Number DE93627052. Source: OSTI; NTIS; INIS.

Turbulence in plasmas has been investigated experimentally and numerically. On the experimental side the turbulent nature of the Kelvin-Helmholtz instability has been studied in a single-ended Q-machine. The development of coherent structures in the background of the turbulent flow has been demonstrated and the capability of structures of transporting plasma across the magnetic field-lines is explained in detail. The numerical investigations are divided into two parts: Numerical simulations of the dynamics from the Q-machine experiments using spectral methods to solve the two-dimensional Navier-Stokes equations in a cylindrical geometry. A numerical study of the Eulerian-Lagrangian transformation in a two-dimensional flow. Here the flow is made up by a large number of structures, where each individual structure is convected by the superposed flow field of all the others. (au) (33 ills., 67 refs.).

25283 (UCRL-JC–109369) **Analysis techniques for directly and indirectly driven hydrodynamic experiments on Nova.** Glendinning, S.G.; Remington, B.A.; Haan, S.W.; Munro, D.H.; Weber, S.V. Lawrence Livermore National Lab., CA (United States). 7 Apr 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920362–44: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE93009244. Source: OSTI; NTIS; GPO Dep.

Over the past five years we have performed an extensive series of experiments on hydrodynamic (Rayleigh-Taylor) instabilities. Typically such experiments involve the time-resolved radiography of an accelerated foil (planar geometry) with the line of sight of the radiograph along the direction of motion. In comparing experimental data to simulations, the simplest approach is to extract the modulation in exposure level of such a radiograph vs time and compare the inferred growth rate (assumed to be exponential) with the growth rate in column density ($\Delta\rho z$) from a simulation. We have found that this gives unsatisfactory results. We will discuss the techniques for experimental analysis and postprocessing of simulations which we use for a more direct comparison of the data with the simulation, including the extraction of Fourier components vs. time from the data, the effect of backlighter spectra, emission from sources other than the backlighter, and the non-linear effects of instrument response.

25284 (UCRL-JC–109804) **Electron temperature measurements of x-ray laser plasmas.** Young, B.K.F.; Osterheld, A.L.; Shepherd, R.L.; Shimkaveg, G.M.; Cerjan, C.J.; Goldstein, W.H.; Rosen, M.D.; Walling, R.S.; Stewart, R.E. Lawrence Livermore National Lab., CA (United States). 6 Aug 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920523–9: 3. international colloquium on x-ray lasers, Schliersee (Germany), 18-22 May 1992). Order Number DE93011874. Source: OSTI; NTIS; GPO Dep.

We present results of recent experiments at the NOVA laser to measure the electron temperature of neon-like yttrium X-my laser plasmas. Trace amounts of aluminum were introduced into yttrium exploding-foil targets. Time resolved electron temperatures were determined by comparing the measured aluminum K-shell spectra

with detailed quasi-steady state calculations and are compared to 2D LASNEX hydrodynamics simulations.

25285 (UCRL-JC–111840) **3D gyrokinetic particle-in-cell simulation of fusion plasma microturbulence on parallel computers.** Williams, T.J. Lawrence Livermore National Lab., CA (United States). Dec 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-930372–10: 1993 international simulators conference on high performance computing, Arlington, VA (United States), 29 Mar - 1 apr 1993). Order Number DE93012503. Source: OSTI; NTIS; GPO Dep.

One of the grand challenge problems now supported by HPCC is the Numerical Tokamak Project. A goal of this project is the study of low-frequency microinstabilities in tokamak plasmas, which are believed to cause energy loss via turbulent thermal transport across the magnetic field lines. An important tool in this study is gyrokinetic particle-in-cell (PIC) simulation. Gyrokinetic, as opposed to fully-kinetic, methods are particularly well suited to the task because they are optimized to study the frequency and wavelength domain of the microinstabilities. Furthermore, many researchers now employ low-noise δf methods to greatly reduce statistical noise by modelling only the perturbation of the gyrokinetic distribution function from a fixed background, not the entire distribution function. In spite of the increased efficiency of these improved algorithms over conventional PIC algorithms, gyrokinetic PIC simulations of tokamak fully-vectorized codes on vector supercomputers. For this reason, we have worked for several years to redevelop these codes on massively parallel computers. We have developed 3D gyrokinetic PIC simulation codes for SIMD and MIMD parallel processors, using control-parallel, data-parallel, and domain-decomposition message-passing (DDMP) programming paradigms. This poster summarizes our earlier work on codes for the Connection Machine and BBN TC2000, and our development of a generic DDMP code for distributed-memory parallel machines. We discuss the memory-access issues which are of key importance in writing parallel PIC codes, with special emphasis on issues peculiar to gyrokinetic PIC. We outline the domain decompositions in our new DDMP code and discuss the interplay of different domain decompositions suited for the particle-pushing and field-solution components of the PIC algorithm.

25286 (UCRL-JC–111903) **Measuring opacity of shock generated argon plasmas.** Erskine, D.; Rozsnyai, B.; Ross, M. Lawrence Livermore National Lab., CA (United States). Sep 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9208135–5: International conference on the physics of strongly coupled plasmas, Rochester, NY (United States), 17-21 Aug 1992). Order Number DE93013038. Source: OSTI; NTIS; GPO Dep.

Plasmas are generated by passage of a strong planar shock wave through gas. Initial experiments in argon have produced plasmas with 2 eV temperature, 0.004 gm/cm^3 density, and coupling parameter $\Gamma \sim 0.3-0.7$. Plasmas having $\Gamma > 1$ are attainable with greater initial gas pressure. The opacity of the plasma is measured versus wavelength by recording the risetime of emitted light. Initial measurements are in visible light. Preliminary results are compared with calculations using the HOPE code.

25287 (ANL/EP/CP–78386) **Modeling of erosion and redeposition processes.** Brooks, J.N. Argonne National Lab., IL (United States). [1992]. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-921053–3: International Atomic Energy Agency technical committee meeting on atomic and plasma material interaction data for fusion reactor technology, Cadarache (France), 12-16 Oct 1992). Order Number DE93008649. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of erosion/redeposition (E/R) modeling is to predict the effects of sputtering on: (1) erosion rates and lifetimes of tokamak divertors, limiters, and th first wall, (2) tritium co-deposition, and (3) plasma contamination. Because of the specialized and complex phenomena associated with surface derived impurities, in particular surface interactions, sheath transport, and multiple charge state effects, it has proven useful to develop models and computer codes specifically for E/R calculations. These are used in conjunction with codes and analysis of th background hydrogen plasma. The E/R codes fall primarily into two categories: (1) trace impurity content codes for treatment of near-surface and scrape-off layer (SOL) transport, and (2) non-trace codes, e.g., for self-consistent, oblique magnetic field sheath calculations within-sheath ionization of sputtered impurities. The intent of this paper is to review current research activities in E/R modeling with emphasis on the codes mentioned above. Recent applications are describe including analysis for the ITER divertor. Results of several recent code verification activities via comparison with experimental data are discussed. Data needs an sensitivity to ionization rate uncertainties are also discussed. A brief description of work in the key area of surface roughness modeling is included.

25288 (CEA-CONF–11238) **Thermal behaviour of the water-cooled lithium-lead box-shaped Demo blanket during a loss-of-coolant accident.** Giancarli, L.; Proust, E.; Mouquet, N.; Salavy, J.F.; Hernot, M.; Franenberg, H.W. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie. 1992. [5p.] (CONF-920930–: 17. symposium on fusion technology, Rome (Italy), 14-18 Sep 1992). Order Number DE93627226. Source: OSTI; NTIS (US Sales Only); INIS.

This paper concerns the preliminary investigation of the thermal behaviour and of the afterheat removal capability of the water-cooled lithium-lead box-shaped DEMO blanket in case of Loss-Of-Coolant Accident (LOCA). The thermal behaviour of the outboard-segment first wall and breeder region has been determined in an hypothetical accidental situation where convection cooling of the outboard blanket is totally lost. The case of two separate water-cooling circuits has been considered, and three possible connection schemes have been analyzed. The minimum temperature increase has been obtained when a crossed inboard/outboard cooling-circuits connection is assumed (inboard segment-box and outboard breeder-box from one side, the reverse from the other side). In case of LOCA in the outboard breeder region, the obtained maximum temperature is 550 deg C reached after about 20 seconds. The corresponding thermal stresses remain below the allowed limit. On the contrary, if the LOCA happens in the outboard segment-box, the maximum temperature of 625 deg C is reached after 1 hour in the first wall and the thermal stresses are too high. Possible solutions are briefly discussed. A similar analysis has also been performed for a different water-cooled lithium-lead blanket concept, the cylindrical module concept. The comparison between the two concepts indicates that their thermal behaviour in case of LOCA is very similar, although the cylindrical modules concept reaches slightly higher temperatures.

25289 (CEA-CONF–11239) **Water-cooled lithium-lead box-shaped blanket concept for Demo: thermo-mechanical optimization and manufacturing sequence proposal.** Baraer, L. (CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie); Dinot, N.; Giancarli, L.; Proust, E.; Salavy, J.F.; Severi, Y.; Quintric-Bossy, J. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie. 1992. [5p.] (CONF-920930–: 17. symposium on fusion technology, Rome (Italy), 14-18 Sep 1992). Order Number DE93627227. Source: OSTI; NTIS (US Sales Only); INIS.

The development of the water-cooled lithium-lead box-shaped blanket concept for DEMO has now reached the stage of thermo-mechanical optimization. In the previous design phases the preliminary dimensioning of the cooling circuit has permitted to define the water proportions required in the breeder region and to demonstrate, after a minimization of steel proportion and thicknesses, that this concept could reach tritium breeding self-sufficiency. In the present analysis the location of the coolant pipes has been optimized for the whole equatorial plane cross-section of both inboard and outboard segments in order to maintain the maximum Pb-17Li/steel interface temperature below 480 deg C and to minimize the thermal gradients along the steel structures. The consequent thermo-mechanical analysis has shown that the thermal

stresses always remain below the allowable limits. Segment fabricability and removal are the next design issues to be analyzed. Within this strategy, a first manufactury sequence for the outboard segment is proposed.

25290 (CEA-CONF–11240) **Breeding blanket for Demo.** Proust, E. (CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie); Giancarli, L.; Anzidei, L.; Casini, G.; Dalle Donne, M.; Malang, S. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie. 1992. [13p.] (CONF-920930–: 17. symposium on fusion technology, Rome (Italy), 14-18 Sep 1992). Order Number DE93627228. Source: OSTI; NTIS (US Sales Only); INIS.

This paper presents the main design features, their rationale, and the main critical issues for the development, of the four DEMO-relevant blanket concepts presently investigated within the framework of the European Test-Blanket Development Programme.

25291 (CEA-CONF–11241) **Further neutronic analyses of the European ceramic B.I.T. blanket for Demo.** Giancarli, L. (CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie); Diop, C.; Petrizzi, L.; Rado, V. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie. 1992. [5p.] (CONF-920930–: 17. symposium on fusion technology, Rome (Italy), 14-18 Sep 1992). Order Number DE93627229. Source: OSTI; NTIS (US Sales Only); INIS.

The present study concerns the most recent neutronic analyses of two design versions of the european ceramic B.I.T. blanket, jointly developed by ENEA and CEA since few years. The last year developments required a new 3-D geometry evaluations of the global TBR (Tritium Breeding Ratio). The results indicated that the ENEA version reaches a global TBR value of 1.13. The CEA version, in a 3-D model using a simplified description of the breeder module layout, reaches a TBR value of 1.12. Nuclear heat deposition density has been determined for all blanket components as a function of the poloidal co-ordinate. Shielding properties of this type of blanket have been analyzed.

25292 (CONF-9301106–1) **Looking beyond ITER: Toroidal concept improvement.** Sheffield, J. Oak Ridge National Lab., TN (United States). [1993]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Fusion Power Associates annual meeting; La Jolla, CA (United States); 28-29 Jan 1993. Order Number DE93012762. Source: OSTI; NTIS; INIS; GPO Dep.

The International Thermonuclear Experimental Reactor (ITER) will demonstrate ignition and undertake fusion reactor systems integration and testing. Its design will be based upon relatively conservative physics assumptions. More attractive reactor configurations than those based upon ITER physics and the ITER configuration appear possible. The Toroidal Physics Experiment (TPX) will study tokamak behavior under a variety of conditions which may allow operation of improved combinations of beta, transport, and recirculating power. However, TPX still retains a configuration similar to ITER. Two alternative approaches appear interesting, based upon recent experimental results: the very low aspect ratio tokamak, or spherical torus, and the stellarator.

25293 (CONF-9303153–1) **ITER EDA design confinement capability.** Uckan, N.A. Oak Ridge National Lab., TN (United States). [1993]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International thermonuclear experimental reactor meeting; Atlanta, GA (United States); 10 Mar 1993. Order Number DE93013729. Source: OSTI; NTIS; INIS; GPO Dep.

Major device parameters for ITER-EDA and CDA are given in this paper. Ignition capability of the EDA (and CDA) operational scenarios is evaluated using both the 1-1/2-D time-dependent transport simulations and 0-D global models under different confinement [$\chi(\nabla T_e)_{crit}$, empirical global energy confinement scalings, χ(empirical), etc.] assumptions. Results from some of these transport simulations and confinement assessments are summarized in and compared with the ITER CDA reference ignition scenario.

25294 (CONF-9304112–6) **Arc detection and protection in high-power antenna systems.** Caughman, J.B.O.; Hoffman, D.J. Oak Ridge National Lab., TN (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 10. topical conference on radio frequency power in plasmas; Boston, MA (United States); 1-3 Apr 1993. Order Number DE93013272. Source: OSTI; NTIS; INIS; GPO Dep.

In an effort to establish a criteria for determining the presence of an arc in an antenna system, the change in the input reflection coefficient caused by an arc of arbitrary impedance and location has been calculated for two representative antenna systems. The antenna systems that have been studied are a resonant double loop antenna system (Tore Supra, TFTR) and a coupled four-strap antenna system (DIII-D). The amount of power that is coupled into an arc as a function of the reflection coefficient and arc impedance has been calculated. Results of the calculation have shown that up to fifty percent of the forward power can be coupled to an arc, when the measured reflection coefficient is 0.5 and up to ten percent of the forward power can be coupled to an arc when the reflection coefficient is 0. 1, depending on the impedance and location of the arc and the particular antenna system. The calculations have shown that changes in the magnitude of the reflection coefficient caused by an arc are, often accompanied by changes in voltage ratios on the same current strap or between different straps and by changes in the phase angles of the voltages and/or the reflection coefficient. Recommendations for the use of voltage magnitude and phase detectors as a diagnostic for arc detection and protection are made.

25295 (CONF-9304112–7) **Power compensators for phased operation of antenna arrays on JET and DIII-D.** Goulding, R.H. (Oak Ridge National Lab., TN (United States)); Hoffman, D.J.; Ryan, P.M.; Bosia, G.; Bures, M.; Start, D.; Wade, T.; Petty, C.C.; Pinsker, R.I. Oak Ridge National Lab., TN (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 10. topical conference on radio frequency power in plasmas; Boston, MA (United States); 1-3 Apr 1993. Order Number DE93013208. Source: OSTI; NTIS; INIS; GPO Dep.

A system has been designed to allow operation of the JET A2 antenna arrays with phasing between elements of other than 0 or π at increased power. The system uses a hybrid coupler to transfer power in the direction opposite to that occurring at the antenna elements. This results in nearly equal currents and voltages on the feed lines and antenna structures, with nearly equal input powers at the rf generators. The direction and magnitude of the power transfer is controlled by adjustable tuning elements mounted on two of the four coupler ports. Much insight has been gained on optimization of the circuit design to maximize bandwidth (~10 MHz for the present JET design with 20 MHz a possibility) and power-handling capability. The concept has been tested initially on the DIII-D tokamak, with a compensator installed in the feed circuit for the four-element FWCD antenna array. In this application it acts to equalize input impedances, and will eventually be used to allow operation with multiple transmitters.

25296 (CONF-9304112–8) **Electrical characterization of the JET A_2 antenna: Comparison of model with measurements.** Ryan, P.M. (Oak Ridge National Lab., TN (United States)); Goulding, R.H.; Bhatnagar, V.; Kaye, A.; Wade, T. Oak Ridge National Lab., TN (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 10. topical conference on radio frequency power in plasmas; Boston, MA (United States); 1-3 Apr 1993. Order Number DE93012964. Source: OSTI; NTIS; INIS; GPO Dep.

The JET experiment is replacing its previous (AI) antennas with upgraded designs (A2) for its upcoming "pumped diverter" operation. These antennas are more directional than the previous two-strap AI antennas when operated as a phased array. The frequency range is 23 to 57 MHz. A full-scale low power "flat" mockup was tested at JET; strap lengths were adjusted to give balanced operation with resonance at 42 MHz. A second mockup module, differing only slightly from the original, was subsequently fabricated and both modules were sent to ORNL for additional measurements and to test the operation of the power compensator circuit. There

are benefits to using a transmission line model to characterize coupled antenna systems, primarily in the ease of incorporating the antennas into the overall analysis of the transmission, tuning, and matching system. The characteristics of the array under arbitrary phasing are also needed for the design, analysis, and control of the power compensator. There are aspects of the JET A2 antenna geometry that differ considerably from previously modeled cases. Each transmission line feeds two poloidally-stacked straps connected in parallel. The parallel straps present different electrical loads at the match point due to geometrical differences. Currents in one section of the strap influence other sections of the same strap as well as in neighboring straps due to internal inductive coupling. The lengths of the inner and outer straps differ; moreover, the inner straps are fed from ports located behind the outer straps, resulting in increased coupling between the inner and outer straps due to the long feed lines and in greater disparity between the electricai loads presented at the inner and outer feed ports. The present effort is to determine whether a more general coupled transmission line model can characterize the array response with sufficient accuracy for the purpose of design and analysis.

25297 (CONF-9304112–9) **Design of the ion cyclotron system for TPX.** Swain, D. (Oak Ridge National Lab., TN (United States)); Shipley, S.; Yugo, J.; Goulding, R.; Batchelor, D.; Stallings, D.; Fredd, E. Oak Ridge National Lab., TN (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 10. topical conference on radio frequency power in plasmas; Boston, MA (United States); 1-3 Apr 1993. Order Number DE93012961. Source: OSTI; NTIS; INIS; GPO Dep.

The TPX experiment will operate for very long pulse times ($\geq$ 1000 s) and will require current drive of several different types to explore the advanced physics operating modes as one of its main missions. Fast wave current drive (FWCD) using ion cyclotron waves in the 40–80 MHz range will be used as one of the main current-drive mechanisms. For initial operation, 8 MW of rf will be supplied, along with 8 MW of neutral beams and 1.5 MW of lower hybrid power. The ion cyclotron (IC) system is a major part of the TPX heating and current drive system. The IC system must: supply 8 MW of power through two main horizontal ports; be upgradable to provide up to 12 MW of rf power through two ports; operate, for 1000-s pulses every 75 min; drive current using FWCD with high reliability; be bakeable to 350°C for cleaning; and incorporate shielding to attenuate the neutron and gamma flux from DD operation so that hands-on maintenance can be performed exterior to the vacuum vessel. The system will consist of four modified FMIT power units that will be upgraded to deliver 2 MW each to the plasma. Two antennas, each with six current straps, will be located in adjacent ports. A sophisticated matching system is needed to provide experimental flexibility and reliability.

25298 (CONF-9304112–12) **Effect on antenna structure of high power rf during plasma operation.** Haste, G.R. (Oak Ridge National Lab., TN (United States)); Thomas, C.E.; Fadnek, A.; Carter, M.D.; Beaumont, B.; Becoulet, A.; Kuus, H.; Saoutic, B. Oak Ridge National Lab., TN (United States). [1993]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 10. topical conference on radio frequency power in plasmas; Boston, MA (United States); 1-3 Apr 1993. Order Number DE93013278. Source: OSTI; NTIS; INIS; GPO Dep.

High-power, long-pulse operation on the Tore Supra tokamak results in considerable stress on the plasma-facing components. The ICH antennas must deliver high-power rf(up to 4 MW per antenna) in this environment. The antenna structure is therefore subjected to the power flux resulting from the interaction between rf and the edge plasma. The structure's response during operation is described, as is the condition of the antenna after prolonged use.

25299 (DOE/DP–0110P) **Tritium consolidation comparison study: Cost analysis.** USDOE, Washington, DC (United States). Dec 1992. 83p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93007431. Source: OSTI; NTIS; GPO Dep.

In February 1991 the Department of Energy released the Nuclear Weapons Complex Reconfiguration Study. As a part of the planning for this effort the Department released the Nonnuclear Consolidation Plan (NCP) to analyze alternatives on how best to achieve the preferred option of consolidating nonnuclear activities at a single site. This plan compared six plants - Kansas City, Mound, Pinellas, Rocky Flats, Y-12 and Pantex - as possible nonnuclear consolidation sites. Based upon analysis of this plan the Department announced that an Environmental Assessment would be prepared on the preferred alternative of consolidating most of the activity at the Kansas City Plant with some work relocated to other sites. The tritium activity at the Mound Plant (MP) would be transferred to the Savannah River Site (SRS) where significant other tritium activity is conducted. This "Tritium Consolidation Comparison Study: Cost Analysis" was prepared to ascertain the relative cost advantage of locating the tritium activity at either the MP or the SRS. This study compares the costs and schedules for tritium reservoir filling, emptying, surveillance, and processing activities to be performed at the MP and the SRS with the alternative of consolidating. these activities at each of these two sites. For reference purposes this study also sets forth the projected costs of taking no action to reconfigure which would leave both plants operating. The scope of work estimated is for a steady-state weapons workload based on Planning and Production Directive 92-1A. The study found that either site could perform the mission with additional resources. The MP could support an operational date for all requirements in late 1996 while the SRS date would be late 1997.

25300 (DOE/EH–0316) **Report on the oversight assessment of the operational readiness review of the Replacement Tritium Facility at Savannah River Site.** Lee, B.T. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Mar 1993. 24p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93011223. Source: OSTI; NTIS; GPO Dep.

This report presents the results of an oversight assessment (OA) conducted by the US Department of Energy's (DOE) Office of Environment, Safety and Health (EH) of operational readiness review (ORR) activities for the Replacement Tritium Facility (RTF) located at Savannah River Site (SRS). The EH OA of this facility took place concurrently with an ORR conducted by the DOE Office of Defense Programs (DP). The DP ORR was conducted from January 19 through February 5, 1993. The EH OA was performed in accordance with the protocol and procedures specified in "EH Program for Oversight Assessment of Operational Readiness Evaluations for Startups and Restarts," dated September 15, 1992. The EH OA Team evaluated the DP ORR to determine whether it was thorough and demonstrated sufficient inquisitiveness to verify that the implementation of programs and procedures adequately ensures the protection of worker safety and health. The EH OA Team performed its evaluation of the DP ORR in the following technical areas: occupational safety, industrial hygiene, and respiratory protection; fire protection; and chemical safety. In the areas of fire protection and chemical safety, the EH OA Team conducted independent vertical-slice reviews to confirm DP ORR results. Within each technical area, the EH OA Team reviewed the DP ORR Plan, including the Criteria Review and Approach Documents (CRADs); the qualifications of individual DP ORR team members; the performance of planned DP ORR activities; and the results of the DP ORR.

25301 (DOE/ER–0313/13) **Fusion reactor materials semiannual progress report for period ending September 30, 1992.** Oak Ridge National Lab., TN (United States). [1992]. 378p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/M–2722). Order Number DE93013462. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains papers on the following topics on thermonuclear reactor materials: irradiation facilities, test matrices, and experimental methods; dosimetry, damage parameters,and activation calculations; radiation effects, mechanistic studies, theory and modeling; development of structural alloys; solid breeding materials and beryllium; and ceramics. These reports have been index separately elsewhere.

25302 (DOE/ER/53098–T9) **Theory of field-reversed configurations: Final report.** Steinhauer, L.C. STI Optronics, Bellevue, WA (United States). 29 Jan 1993. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-80ER53098. Order Number DE93015611. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes results from the theoretical program on field reversed configurations (FRC) at STI Optronics. The program, which has spanned the last 13 years, has included analytical as well as computational components. It has led to published papers on every major topic of FRC theory. The report is outlined to summarize results from each of these topic areas: formation, equilibrium, stability, and confinement. Also briefly described are Steinhauer's activities as Compact Toroid Theory Listening Post. Appendix A is a brief listing of the major advances achieved in this program. Attached at the back of this report is a collection of technical papers in archival journals that resulted from work in this program. The discussion within each subsection is given chronologically in order to give a historical sense of the evolution of understanding of FRC physics.

25303 (DOE/FTR–93012118) **[Travel by Plasma Fusion Center personnel to attend conferences in Austria, Belgium, and Germany concerning plasma and fission physics]: Foreign trip report, June 27, 1992–July 11, 1992.** Porkolab, M. Massachusetts Inst. of Tech., Cambridge, MA (United States). Plasma Fusion Center. [1992]. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER54110. Order Number DE93012118. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Summaries of topics discussed at the following three meetings are given: (i) Joint meeting of the 1992 ICPP International Conference on Plasma Physics 19th EPS conf. on Controlled Fusion and Plasma physics and the 9th Kiev International Conference on Plasma theory, at Innsbruck, Austria, (June 29–July 3); (ii) Europhysics topical Conference on Radiofrequency Heating and current Drive of fusion Devices, Brussels, Belgium, 1992 (July 7–10, 1992); and (iii) Visit/attend ASDEX-UPGRADE workshop on ICRF heating (Ringberg Castle, Germany)(July 6, 1992).

25304 (DOE/FTR–93012977) **[Initiate an experimental and modeling collaboration with Russian scientists on hydrogen isotope retention and release from plasma- facing materials]: Foreign trip report, June 29–July 10, 1992.** Bastasz, R. Sandia National Labs., Livermore, CA (United States). [1992]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93012977. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report summarizes the authors participation in the 1992 US/Russian Federation exchange I.3("Joint Work: Hydrogen Isotope Retention, Remission") in fusion energy research. It describes various aspects of fusion research (primarily in the areas of plasma-surface interactions and plasma-facing materials development) at the Russian institutes TRINITI, IPC, and MEPI. Several areas of mutual interest and potential collaboration are discussed.

25305 (DOE/FTR–93013553) **[Travel to Germany to participate in the ITER meeting on divertor and first wall]: Foreign trip report, June 22–July 1, 1992.** Gauster, W.B. Sandia National Labs., Albuquerque, NM (United States). 20 Jul 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93013553. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Summaries of the sessions on Materials R&D of the ITER Meeting on Divertor and First Wall are given.

25306 (EGG-M–92627) **Failure rate data for fusion safety and risk assessment.** Cadwallader, L.C. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-930243–6: Data banks for risk assessment workshop, Augusta, GA (United States), 2-3 Feb 1993). Order Number DE93010807. Source: OSTI; NTIS; INIS; GPO Dep.

The Fusion Safety Program (FSP) at the Idaho National Engineering Laboratory (INEL) conducts safety research in materials, chemical reactions, safety analysis, risk assessment, and in component research and development to support existing magnetic fusion experiments and also to promote safety in the design of future experiments. One of the areas of safety research is applying probabilistic risk assessment (PRA) methods to fusion experiments. To apply PRA, we need a fusion-relevant radiological dose code and a component failure rate data base. This paper describes the FSP effort to develop a failure rate data base for fusion-specific components.

25307 (INDC(NDS)–237/M6) **IAEA consultants' meeting on thermal response of plasma facing materials and components: Summary report.** Janev, R.K. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Jul 1990. [15p.] (CONF-9006441–: IAEA consultants' meeting on thermal response of plasma facing materials and components, Vienna (Austria), 11-13 Jun 1990). Order Number DE93627134. Source: OSTI; NTIS (US Sales Only); INIS.

The present Summary Report contains brief proceedings and the main conclusions and recommendations of the IAEA Consultants' Meeting on "Thermal Response of Plasma Facing Materials and Components", which was organized by the IAEA Atomic and Molecular Data Unit and held on June 11-13, 1990, in Vienna, Austria. The Report also includes a categorization and assessment of currently studied plasma facing materials, a classification scheme of material properties data, required in fusion reactor design, and a survey of the urgently needed material properties data. (author).

25308 (INDC(NDS)–264/G) **Summary report of the IAEA advisory group meeting on nuclear data for neutron multiplication in fusion-reactor first-wall and blanket materials.** Muir, D.W. (International Atomic Energy Agency, Vienna (Austria). Nuclear Data Section); Pashchenko, A.B. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. Sep 1992. [28p.] (CONF-9011327–: IAEA advisory group meeting on nuclear data for neutron multiplication in fusion-reactor first-wall and blanket materials, Chengdu (China), 19-21 Nov 1990). Order Number DE93627252. Source: OSTI; NTIS (US Sales Only); INIS.

The present Report contains the Summary of the IAEA Advisory Group Meeting on Nuclear Data for Neutron Multiplication in Fusion-Reactor First-Wall and Blanket Materials, which was hosted by the Southwest Institute of Nuclear physics and Chemistry (SWINPC) at Chengdu, China and held from 19-21 November 1990. This AGM was organized by the IAEA Nuclear Data Section (NDS), with the cooperation and assistance of local organizers at the SWINPC. The papers which the participants prepared for and presented at the meeting will be published as an INDC report. (author).

25309 (INIS-JP–007, pp. 245-250) **Evaluation of high energy intense neutron source concepts for fusion materials testing.** Noda, K. (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 817p. (CONF-911154–: International conference on evolution in beam applications, Takasaki (Japan), 5-8 Nov 1991). In *Proceedings of the international conference on evolution in beam applications.* Order Number DE93703820. Source: OSTI; NTIS; INIS.

Fusion materials testing and development cannot be achieved without a high energy intense neutron source which simulates the fusion reactor neutron environment. Criteria of suitability for a fusion materials irradiation test facility fulfilling the world-wide demand, so-called 'International Fusion Material Irradiation Facility' (IFMIF), were defined in an IEA activity on fusion materials research and development (R and D). Several concepts of IFMIF candidates were proposed. Furthermore, a concept of high energy neutron irradiation facility named 'Energy Selective Neutron Irradiation Test Facility' (ESNIT) was conceived at Japan Atomic Energy Research Institute (JAERI) as a facility for materials researches in generic nuclear applications of which major potential research incentives were originated from nuclear fusion application. In this paper, current evaluation of suitability of various IFMIF and ESNIT concepts for fusion material irradiation testing and their technological feasibility and so on is described. (author).

25310 (INIS-JP–007, pp. 340-345) **Intense positive and negative ion sources for fusion applications.** Okumura, Y. (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 817p. (CONF-911154–: International conference on evolution in beam applications, Takasaki (Japan), 5-8 Nov 1991). In *Proceedings of the international conference on evolution*

in beam applications. Order Number DE93703820. Source: OSTI; NTIS; INIS.

Technologies producing intense positive and negative ion beams have been highly developed in these two decades for fusion applications; e.g. heating the thermonuclear fusion plasmas by intense neutral beams, beam diagnostics of the plasma, etc. At present, it is possible to produce several tens of ampere positive ion beams continuously at beam energies of 100-200 keV with good beam optics. Recently, negative ion source have also been developed for next generation fusion experiments. Multi-ampere H^-/D^- ion beams have been successfully produced and R and D's to increase the beam energy up to 0.5-1 MeV are now in progress. (author).

25311 (INIS-JP–007, pp. 368-373) **Generation and acceleration of highly ionized metallic ions with the 'point pinch diode'.** Sato, M. (Himeji Inst. of Tech., Hyogo (Japan)); Tazima, T. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 817p. (CONF-911154–: International conference on evolution in beam applications, Takasaki (Japan), 5-8 Nov 1991). In *Proceedings of the international conference on evolution in beam applications.* Order Number DE93703820. Source: OSTI; NTIS; INIS.

Intense pulsed ion beams have been studied as an energy driver for inertial confinement fusion. However the ion beams have been recently utilized to development of new materials. The 'Point Pinch Diode' which consists of a small spherical cathode and a flat anode has been also used to study for inertial confinement fusion. In this diode, it was reported that the generated ion beam contained significant amounts of highly ionized metallic ions which were produced from anode materials. Taking into account of utilization as an ion source, we investigated the characteristics of the ion beam generated with the 'Point Pinch Diode'. From the experimental results, it was made clear that the generated pulsed ion beams contained large amounts of highly ionized metallic ions (e.g. $Cu^{2+} \approx Cu^{6+}$, $Mo^{2+} \approx Mo^{9+}$, $W^{3+} \approx W^{17+}$, $Pb^{7+} \approx Pb^{17+}$), even though the ion beams contained considerably the light ions (e.g. H^+, $C^+ \approx C^{5+}$, $0^+ \approx 0^{5+}$). Here the acceleration voltage for these ions were 300≈400 kV. The current densities of the ion beams measured at 190 mm from the top of the spherical cathode were 10≈20 A/cm^2. (author).

25312 (INIS-JP–007, pp. 379-382) **Characteristics of a new microwave ion source for plasma-wall interaction studies.** Tokiguchi, K. (Hitachi Ltd., Ibaraki (Japan). Hitachi Research Lab.); Gotoh, Y.; Yamaki, T.; Amemiya, K. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 817p. (CONF-911154–: International conference on evolution in beam applications, Takasaki (Japan), 5-8 Nov 1991). A new microwave ion source for plasma-wall interaction studies was designed and an irradiation apparatus containing the source was constructed. The source efficiently produced H_3^+ or D_3^+ ions through the ion-molecule reaction between H_2^+ (D_2^+) ions and H_2 (D_2) molecules in the ion source plasma chamber. The mass-analyzed H_3^+ ion current reached 1.5 mA at an extraction voltage of 3 kV. The beam diameter was about 1 cm. The irradiation flux density of hydrogen atoms at an energy of 1 keV exceeded 4 x 10^{16} atoms/cm^2·s, which is high enough for plasma-wall interaction studies. (author).

25313 (INIS-JP–007, pp. 692-695) **Thermal shock tests of carbon materials with high power beam.** Akiba, M. (Japan Atomic Energy Research Inst., Naka, Ibaraki (Japan). Naka Fusion Research Establishment); Araki, M.; Ando, T.; Jinbou, R.; Saidoh, M.; Suzuki, S.; Nakamura, K.; Tanaka, S. Japan Atomic Energy Research Inst., Tokyo (Japan). 1992. 817p. In tokamak machines, not only present machine but also future tokamak devices, off-normal events, so called plasma disruption, is considered as unavoidable phenomena. During the plasma disruption, plasma energy will deposit onto the surface of plasma facing components (PFC). Erosion induced by the disruption will be considered as primary limitation factor of life time of the PFCs. To evaluate erosion rate during the disruption, high power beam facilities have strongly been required. JAERI constructed an electron beam test facility to simulate the disruption heat load. The facility can produce an intense electron beam at a heat flux of up to 2000 MW/m^2 from 1 ms. Many carbon based materials, which have regarded at most promising armor materials, have been tested at the facility at a heat flux range from 300 MW/m^2 to 2000 MW/m^2. The erosion depth of carbon-fiber-carbon composites (C/C composites) is ≈ 3 times larger than that of numerical prediction. Carbon based B_4C-coated and B_4C converted materials which have been developed at JAERI have also tested in the facility. The B_4C converted C/C composites show high thermal shock resistance. (author).

25314 (JAERI-M–92-183) **Phase IIC experiments of the USDOE/JAERI collaborative program on fusion blanket neutronics: Experiments and analysis of heterogeneous fusion blankets, volume II: analysis.** Youssef, M.Z. (ed.) (California Univ., Los Angeles, CA (United States)). Japan Atomic Energy Research Inst., Tokyo (Japan). Dec 1992. 119p. (UCLA-FNT–64;UCLA-ENG–93-19). Order Number DE93788399. Source: OSTI; NTIS; INIS.

Effort in Phase IIC of the US/JAERI Collaborative Program on Fusion Neutronics was focused on performing integral experiments and post analyses on blankets that include the actual heterogeneities found in several blanket designs. Two geometrical arrangements were considered for the blanket assembly, namely multi-layers of Li_2O and beryllium in an edge-on, horizontally alternating configuration for a front depth of 30 cm, followed by the Li_2O breeding zone (Be edge-on, BEO, experiment), and vertical water coolant channels arrangement (WCC experiment). The objectives are to examine the accuracy of predicting tritium production. In the BEO system, it was shown that, with the zonal method to measure tritium production from natural lithium (Tn), the calculated-to-measured values (C/E) are 0.95-1.05 (JAERI) and 0.98-0.9 (U.S.), which is consistent with the results obtained in other Phases of the Program (Phases IIA and IIb). In the WCC experiment, there is a noticeable change in C/E values for T_6 near the coolant channels where steep gradients in T_6 production are observed. The C/E values obtained with the Li-foil detectors are on the average closer to unity than those obtained by the Li-glass method. As for T_7, the values obtained by NE213 method are within ±15% in JAERI's calculations, but larger values (≈20-25%) are obtained in the U.S. calculations due to the differences of cross-sections data files. Around heterogeneities, the prediction accuracy for T_7 is better than for T_6. (J.P.N.).

25315 (LALP–93-17) **High-energy density physics at Los Alamos.** Byrnes, P. (ed.); Younger, S.M. Los Alamos National Lab., NM (United States). Mar 1993. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93010271. Source: OSTI; NTIS; INIS; GPO Dep.

This brochure describes the facilities of the Above Ground Experiments II (AGEX II) and the Inertial Confinement Fusion (ICF) programs at Los Alamo. Combined, these programs represent, an unparalleled capability to address important issues in high-energy density physics that are critical to the future defense, energy, and research needs of th e United States. The mission of the AGEX II program at Los Alamos is to provide additional experimental opportunities for the nuclear weapons program. For this purpose we have assembled at Los Alamos the broadest array of high-energy density physics facilities of any laboratory in the world. Inertial confinement fusion seeks to achieve thermonuclear burn on a laboratory scale through the implosion of a small quantity of deuterium and tritium fuel to very high Pressure and temperature.The Los Alamos ICF program is focused on target physics. With the largest scientific computing center in the world, We can perform calculations of unprecedented sophistication and precision. We field experiments at facilities worldwide-including our own Trident and Mercury lasers-to confirm our understanding and to provide the necessary data base to proceed toward the historic goal of controlled fusion in the laboratory. In addition to direct programmatic high-energy density physics is a nc scientific endeavor in itself. The ultrahigh magnetic fields produced in our high explosive pulsed-power generators can be used in awide variety of solid

state physics and temperature superconductor studies. The structure and dynamics of planetary atmospheres can be simulated through the compression of gas mixtures.

25316 (ORNL/TM–12264) **Multiple Antenna Implementation System (MAntIS).** Carter, M.D.; Batchelor, D.B.; Jaeger, E.F. Oak Ridge National Lab., TN (United States). Jan 1993. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012515. Source: OSTI; NTIS; INIS; GPO Dep.

The MAntIS code was developed as an aid to the design of radio frequency (RF) antennas for fusion applications. The code solves for the electromagnetic fields in three dimensions near the antenna structure with a realistic plasma load. Fourier analysis is used in the two dimensions that are tangential to the plasma surface and backwall. The third dimension is handled analytically in a vacuum region with a general impedance match at the plasma-vacuum interface. The impedance tensor is calculated for a slab plasma using the ORION-ID code with all three electric field components included and warm plasma corrections. The code permits the modeling of complicated antenna structures by superposing currents that flow on the surfaces of rectangular parallelepipeds. Specified current elements have feeders that continuously connect the current flowing from the ends of the strap to the feeders. The elements may have an arbitrary orientation with respect to the static magnetic field. Currents are permitted to vary along the length of the current strap and feeders. Parameters that describe this current variation can be adjusted to approximately satisfy boundary conditions on the current elements. The methods used in MAntIS and results for a primary loop antenna design are presented.

25317 (PPPL–2879) **Simulations of beam-fueled supershot-like plasmas near ignition.** Budny, R.V. (Princeton Univ., NJ (United States). Plasma Physics Lab.); Grisham, L.; Jassby, D.L.; Manickam, J.; Mikkelsen, D.; McCune, D.; McGuire, K.M.; Scott, S.D.; Stotler, D.; Wieland, R.; Zarnstorff, M.C.; Zweben, S.J.; Sabbagh, S.A. Princeton Univ., NJ (United States). Plasma Physics Lab. Mar 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03073. (CONF-9206247–2: 19. European Physical Society (EPS) conference on controlled fusion and plasma physics, Innsbruck (Austria), 29 Jun - 4 jul 1992). Order Number DE93011498. Source: OSTI; NTIS; INIS; GPO Dep.

Centrally peaked profiles would be advantageous for tokamak reactors since the pressure and the bootstrap current would be peaked in the regions of intense reactivity. We use the TRANSP plasma analysis code to investigate the feasibility of fueling with neutral beam injection. We show that for certain conditions, neutral beams with energies less than 120 keV can penetrate into the cores of plasmas that have a large thermonuclear yield and Q_{DT} ~10. This value of ODT is too small for an economical reactor if the neutral beam injection is the only fueling source. We give examples for several proposed compact prototype reactor designs.

25318 (UCRL-CR–109549) **Gas dynamics in the central cavity of HYLIFE-II reactor.** Chen, X.M.; Schrock, V.E.; Peterson, P.F.; Colella, P. Lawrence Livermore National Lab., CA (United States). 10 Mar 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920607–22: 10. topical meeting on technology of fusion energy, Boston, MA (United States), 7-12 Jun 1992). Order Number DE93009322. Source: OSTI; NTIS; INIS; GPO Dep.

In a HYLIFE-II ICF reactor, the microfusion of the D-T capsule in the center of the chamber produces X-rays that can ablate a thin layer off the liquid blanket which protects the first structural wall Thisablated material will implode toward the center line of the central cavity due to the initial vacuum and cylindrical geometry, and then rebound back to the liquid blanket vent through it and exert a pressure "impulse" onto the structural wall. The initial ablation occurs in a very short period with very small characteristic length and the implosion and rebounding processes feature very high pressures and temperatures. The proper design of the chamber relies on the reasonably accurate analysis of the gas dynamics in the central cavity and the gas-liquid interaction. In this paper, a second order Godunov numerical method is used to solve the compressible flow equations in the central cavity. The rarefaction and shock phenomena are very well captured by the numerical calculation. The equation of state for Flibe vapor is used in the calculation along with the parameters for the HYLIFE-II design. Since the radiation transport has not yet been included in the current calculations, the vapor possesses higher energy and therefore temperature. The total mass vaporized will also be underestimated in the later time of the calculation. The incorporation of a radiation calculation into this code is our next goal.

25319 (UCRL-ID–111589) **Heat load analysis on the cable-in-conduit with central core conductor for the TF coil Rebut layer design.** Long, A.E. (Massachusetts Inst. of Tech., Cambridge, MA (United States)). Lawrence Livermore National Lab., CA (United States). 23 Sep 1992. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93013783. Source: OSTI; NTIS; GPO Dep.

The current Rebut Layer Design for the ITER TF coil calls for a cable-in-conduit with central core conductor, representing a break from the conventional configuration. In an effort to find the maximum heat load which this conductor can sustain without instigating quench, a model was developed to characterize the heat transfer behavior of the core. This model approximates the superconducting strands as double-sided fins exposed to two separate, parallel liquid helium flows. The model successfully predicts a reasonable value of maximum heat load, and yields results that compare well with a preliminary, computational analysis. The double-sided fin model also provides information on how such geometric parameters as core-to-cable space area ratio and strand winding angle can be adjusted to improve the heat transfer performance of the conductor. Experimental verification of the model is needed to insure compatibility with actual designs.

25320 (UCRL-ID–113500) **Seismic upgrade of the Nova capacitor bank.** Tietbohl, G.L. (Lawrence Livermore National Lab., CA (United States)); Patel, C.S. Lawrence Livermore National Lab., CA (United States). 5 Apr 1993. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93014368. Source: OSTI; NTIS; GPO Dep.

The main capacitor bank for the Nova laser system at Lawrence Livermore National Laboratory was found to be seismically unsafe after the 1989 Loma Prieta earthquake. A method of strengthening the bank was developed, which satisfied the current seismic design criteria and minimized the downtime of the laser system during installation. Before implementation, the design was analyzed by finite element methods and the building was checked for load capacity. The bank is now upgraded to current seismic standards.

25321 (UCRL-JC–110-843) **Simulations of DIII-D divertor biasing with the LEDGE code.** Rensink, M.E.; Milovich, J.; Rognlien, T. Lawrence Livermore National Lab., CA (United States). Sep 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9209181–7: International Atomic Energy Agency (IAEA) technical committee meeting on tokamak plasma biasing, Montreal (Canada), 8-10 Sep 1992). Order Number DE93010500. Source: OSTI; NTIS; INIS; GPO Dep.

We use the LEDGE 2-d fluid model for the edge plasma to determine the effects of electrically biasing the outboard divertor plate in DIII-D. The LEDGE code includes classical perpendicular and parallel current flows as well as E x B and diamagnetic drifts. Boundary conditions at the divertor plates allow the sheath parameters to vary with current flow across the sheath. Ohmic heating and convective heat flow associated with the current flow are included. Neutrals originating at the divertor plates due to recycling are represented by a fluid model. We explore the effect of cross-field drifts and variations in the bias voltage. The current-voltage characteristic, inboard/outboard heat flux asymmetry and radial plasma profiles are computed. We show that cross-field drifts have a strong effect on the plasma profiles at the diverter plates. Differential biasing of the inboard and outboard divertor plates can significantly modify the naturally occurring outboard/inboard heat flux asymmetry, but only weakly affects radial profiles at the outboard plate.

25322 (UCRL-JC–107242) **ETA-II accelerator upgrades.** Nilson, D.G.; Deadrick, F.J.; Hibbs, S.M.; Sampayan, S.E.; Petersen, D.E. Lawrence Livermore National Lab., CA (United States). Sep 1991. 6p. Sponsored by USDOE, Washington, DC (United States).

DOE Contract W-7405-ENG-48. (CONF-910968–81: 14. IEEE symposium on fusion engineering, San Diego, CA (United States), 30 Sep - 3 oct 1991). Order Number DE93012490. Source: OSTI; NTIS; INIS; GPO Dep.

We discuss recent improvements to the ETA-II linear induction electron accelerator. The accelerator's cells have been carefully reconditioned to raise the maximum accelerating gap voltage from approximately 100 kV to 125 kV. Insulators of Rexolite plastic in a new "zero-gap" arrangement replaced the alumina originals after several alternative materials were investigated. A new multi-cable current feed system will be used to eliminate pulse reflection interactions encountered in earlier experiments. Improved alignment fixtures have been installed to help minimize beam perturbation due to poorly aligned intercell magnets between 10-cell groups. A stretched wire alignment technique (SWAT) has been utilized to enhance overall magnetic alignment, and to characterize irreducible alignment errors. These changes are in conjunction with an expansion of the accelerator from a 20-cell to a 60-cell configuration. When completed, the upgraded accelerator is expected to deliver 2.5 kA of electron beam current at 7.5 MeV in bursts of up to fifty 70-ns pulses at a 5-kHz repetition rate. A 5.5-meter-long wiggler will convert the energy into 3-GW microwave pulses at 140 GHz for plasma heating experiments in the Microwave Tokamak Experiment (MTX).

25323 (UCRL-JC–109253) **K- and L-shell x-ray spectroscopy of indirectly driven implosions.** Hammel, B.A. Lawrence Livermore National Lab., CA (United States). 7 Apr 1992. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920362–45: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE93009245. Source: OSTI; NTIS; GPO Dep.

Time resolved x-ray spectroscopy is used to study the implosion of indirectly driven inertial confinement fusion capsules on the Nova laser. Through the use of high-Z dopants (Ar and Xe) in the fuel, measurements of the peak temperature, from emission line ratios, and density, from line broadening, are obtained. These measurements indicate peak electron temperatures of ~1–1.6 key and electron (and proton) densities in the range of 0.9–2.3 x 10^{24} cm^{-3}, depending on the type of laser drive used. The higher densities are achieved on targets that are driven with a shaped laser drive that allows a more isentropic compression of the fuel. Emission from high-Z pusher dopants has also been studied. These dopants can provide information on pusher conditions, and can be used to study mix at the pusher fuel interface.

25324 (UCRL-JC–109796) **Electrical characteristics of short pulse gated microchannel plate detectors.** Bell, P.M. (Lawrence Livermore National Lab., CA (United States)); Kilkenny, J.D.; Landen, O.L.; Hanks, R.L.; Bradley, D.K. Lawrence Livermore National Lab., CA (United States). 17 Mar 1992. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920362–47: 9. topical conference on high-temperature plasma diagnostics, Santa Fe, NM (United States), 15-19 Mar 1992). Order Number DE93012501. Source: OSTI; NTIS; GPO Dep.

Gating of microchannel plates (MCP) can produce shutter times of less than 40 ps. This is accomplished with high fidelity electronic circuitry and short pulse (sub 80 ps) high amplitude electronic drivers. Measurements have shown that the fidelity of the electrical circuitry is one of the limiting factors in producing shorter X-ray gating.

25325 (UCRL-JC–109811-Rev.1) **A "SUPERCODE" for systems analysis of tokamak experiments and reactors.** Haney, S.W. (Lawrence Livermore National Lab., CA (United States)); Barr, W.L.; Crotinger, J.A.; Perkins, L.J.; Solomon, C.J.; Chaniotakis, E.A.; Freidberg, J.P.; Wei, J.; Galambos, J.D.; Mandrekas, J. Lawrence Livermore National Lab., CA (United States). 4 Mar 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ;FG05-87ER52141 ;AC05-84OR21400. (CONF-920772–2-Rev.1: Topical meeting on the technology of fusion energy, Boston, MA (United States), 7-12 Jul 1992). Order Number DE93012593. Source: OSTI; NTIS; INIS; GPO Dep.

A new code, named SUPERCODE, has been developed to fill the gap between currently available zero dimensional systems codes and highly sophisticated, multidimensional plasma performance codes. The former are comprehensive in content, fast to execute, but rather simple in terms of the accuracy of their physics and engineering models. The latter contain state-of-the-art plasma physics modeling but are limited in engineering content and are time consuming to run. The SUPERCODE upgrades the reliability and accuracy of systems codes by calculating the self consistent 1 1/2-D plasma evolution in a realistic engineering environment. By a combination of variational techniques and careful formulation there is only a modest increase in CPU time over 0-D runs, thereby making the SUPERCODE suitable for use as a systems studies tool. In addition, we have expended considerable effort to make the code user- and programmer friendly, as well as operationally flexible, with the hope of encouraging wide usage throughout the fusion community.

25326 (UCRL-JC–109977) **Distributed absorption and inhibited heat transport.** De Groot, J.S. (California Univ., Davis, CA (United States)); Estabrook, K.G.; Kruer, W.L.; Drake, R.P.; Mizuno, K.; Cameron, S.M. Lawrence Livermore National Lab., CA (United States). 14 Feb 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-911131–4: 10. international workshop on laser interaction and related plasma phenomena, Monterey, CA (United States), 11-15 Nov 1991). Order Number DE93009554. Source: OSTI; NTIS; GPO Dep.

A new self-consistent model is presented on the spatial structure of a laser heated planar, strongly absorbing plasma. Unlike previous models, this model explicitly includes the temporal evolution of the heat conduction region. It is shown that previous steady-state models apply only to a narrow range of the Parameters (laser energy flux and laser pulse width) that are used in laser pellet fusion. The new model is shown to agree with flux-limited hydrodynamics simulations. The key feature of the new model is a self-similar solution for the spatial profile of the temperature, density, and fluid velocity in the conduction region. It is shown that the sonic surface moves outward at a velocity of about 0.6 of the sound velocity. The most important result of the new model for laser pellet fusion is that the plasma properties at the sonic surface and most importantly the ablation pressure are independent of laser wavelength.

25327 (UCRL-JC–110000) **Three dimensional time-dependent hydrodynamic and propagation modeling of x-ray laser emission.** Ratowsky, R.P. (Lawrence Livermore National Lab., CA (United States)); Feit, M.D.; London, R.A.; Walling, R.S.; Shimkaveg, G.M.; Osterheld, A.L.; Carter, M.R.; Craxton, R.S. Lawrence Livermore National Lab., CA (United States). Jun 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920523–12: 3. international colloquium on x-ray lasers, Schliersee (Germany), 18-22 May 1992). Order Number DE93012575. Source: OSTI; NTIS; INIS; GPO Dep.

We have carried out three dimensional time-dependent calculations of x-ray emission in exploding foil line focus produced plasmas relevant to neon-like yttrium experiments at the Lawrence Livermore National Laboratory (LLNL). Hydrodynamic simulations using LASNEX and a simple gain profile based on XRASER are input into CASER, which solves the radiation transport equation along three dimensional ray orbits. Experimental observables such as farfield patterns and x-ray signal vs. laser length are then computed and compared with experiment. Similar two dimensional calculations have also been performed using the wave optics code WAVE to calculate coherence and confirm the accuracy of the ray optics treatment. We have found good agreement between both experiment and simulation and between the ray and wave optics codes.

25328 (UCRL-JC–110193) **Simulation of heavy ion fusion beams.** Friedman, A. (Lawrence Livermore National Lab., CA (United States)); Barnard, J.J.; Callahan, D.A.; Caporaso, G.J.; Chen, Y.J.; DeFord, J.F.; Grote, D.P.; Hewett, D.W.; Ho, D.D.M.; Langdon, A.B.; Payne, A.N.; Shang, C.C.; Sharp, W.M.; Shay, H.D.; Fawley, WLawrence Livermore National Lab., CA (United States). 10 Jul 1992. 15p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United

States). DOE Contract W-7405-ENG-48 ;AC03-76SF00098. (CONF-9206235–6: International Atomic Energy Agency (IAEA) technical committee meeting on advances in simulation and modeling of thermonuclear plasmas, Montreal (Canada), 15-17 Jun 1992). Order Number DE93012578. Source: OSTI; NTIS; GPO Dep.

Beams of heavy ions generated by induction accelerators represent the principal driver approach in the US Office of Fusion Energy's Inertial Fusion Energy program. The technology appears to be well suited to the requirements of power production, enjoying advantages of efficiency, durability, repetition rate, and survivability of final optics. However, for inertial fusion applications the current is well above that found in conventional high energy physics accelerators, and the beams must be viewed as collisionless, non-neutral plasmas, confined by applied magnetic and electric fields. These space-charge-dominated beam-q must be focused onto small spots at the fusion target and so preservation of a small emittance is crucial. The nonlinear beam self-fields can lead to emittance growth, especially when the beam undergoes many manipulations, which may include: Transport through bends and imperfectly aligned focusing elements, non-steady acceleration, insertion into rings, merging, and splitting. Furthermore, beam formation and injection, and transport through the target chamber, are inherently plasma processes. Thus, a self-consistent field description is generally needed. Because of the beams' low plasma frequencies and short residence times, particle-in-cell techniques are particularly effective. This paper describes the variety of simulation techniques and codes used to model Heavy Ion Fusion beams. These range from simple envelope equation models to elaborate fluid and discrete-particle simulations in 1d, 2d and 3d. The Induction Linac Systems Experiments (ILSE) facility and experimental sequence proposed by the Lawrence Berkeley Laboratory has become the main thrust of the US program. We describe the simulation tools being applied to ILSE and to advanced accelerators, including recirculating induction accelerator concepts. We also describe the codes used to model beam sources and injectors, final focus, chamber transport, and interactions with the target corona.

25329 (UCRL-JC–110202) **Characterization of high-power RF structures using time-domain field codes.** Shang, C.C.; DeFord, J.F.; Swatloski, T.L. Lawrence Livermore National Lab., CA (United States). 21 Aug 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9208109–82: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE93013416. Source: OSTI; NTIS; INIS; GPO Dep.

We have modeled gyrotron windows and gyrotron amplifier sever structures for TE modes in the 100–150 GHz range and have computed the reflection and transmission characteristics from the field data. Good agreement with frequency domain codes and analytic analysis have been obtained for some simple geometries. We present results for realistic structures with lousy coatings and describe implementation of microwave diagnostics.

25330 (UCRL-JC–110329) **Laser-plasma instabilities and coherence control.** Baldis, H.A. (Lawrence Livermore National Lab., CA (United States)); Moody, J.D.; Montgomery, D.S.; Estabrook, K.G.; Berger, R.L.; Williams, E.A.; Kruer, W.L.; Lasinski, B.F.; Dixit, S.N.; Woods, B.; Henesian, M.A.; Hsieh, E.J.; Labaune, C.; Batha, S.H. Lawrence Livermore National Lab., CA (United States). 28 Aug 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920913–30: 14. international conference on plasma physics and controlled nuclear fusion research, Wuerzburg (Germany), 30 Sep - 7 oct 1992). Order Number DE93014117. Source: OSTI; NTIS; INIS; GPO Dep.

The authors experimentally investigate the effect of random phase plate (RPP) beam smoothing on Stimulated Brillouin Scattering (SBS) backscattered light in exploding foil plasmas. The experiments consist of measuring the backscattered SBS emission excited by an unsmoothed and a RPP smoothed interaction beam impinging on a preformed plasma. A Ti or CH plasma is preformed with typically 2500 J of 0.527 μm RPP smoothed laser light with a square pulse of 1 ns. The interaction laser focuses on the center of the preformed plasma with a duration of 1 ns, 0.527 μm wavelength, ~2500 J, and an adjustable delay time. We measure at least 15 times less backscattered SBS energy with a RPP.

25331 (UCRL-JC–110398) **Physics and modelling of scrape-off layer transport.** Cohen, R.H. (Lawrence Livermore National Lab., CA (United States)); Allen, S.L.; Crotinger, J.A.; Kaiser, T.B.; Milovich, J.L.; Mattor, N.; Nevins, W.M.; Porter, G.D.; Rensink, M.E.; Rognlien, T.D.; Berk, H.L.; Campbell, R.B.; Diamond, P.H.; Rosenbluth, M.Lawrence Livermore National Lab., CA (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ;FG05-80ET53088 ;FG03-88ER53275 ;AC04-76DP00789 ;AC03-89ER51114. (CONF-9209290–8: 14. international conference on plasma physics and controlled nuclear fusion research, Wurzburg (Germany), 30 Sep - 7 oct 1992). Order Number DE93010510. Source: OSTI; NTIS; INIS; GPO Dep.

We present studies of three schemes for reducing the peak heat flux on divertor plates, divertor biasing, impurity injection ("radiative divertor") and neutral gas injection ("gas target divertor"). We report on theoretical analysis of a likely source of turbulent transport in the SOL and incorporation of the resultant transport coefficients into self-consistent models.

25332 (UCRL-JC–110868) **Steering algorithms for a heavy-ion recirculating accelerator.** Sharp, W.M.; Barnard, J.J.; Yu, S.S. Lawrence Livermore National Lab., CA (United States). 20 May 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920515–33: 9. international conference on high power particle beams, Washington, DC (United States), 25-29 May 1992). Order Number DE93011947. Source: OSTI; NTIS; INIS; GPO Dep.

For inertial-fusion applications, the beam in proposed recirculating heavy ion accelerators must complete fifty to one hundred laps around lattices that are between two and four killmeters in circumference. Frequent monitoring and correction of the beam-centroid position is essential to avoid unrealistic tolerances on dipole strengths and quadrupole alignment, the beam centroid. Analytic and numerical estimates are made of the beam-centroid displacement due algorithms for both time-dependent and time-independent beam steering are presented. An envelope-code simulation is used to demonstrate their effectiveness.

25333 (UCRL-JC–111381) **Status and plans for ITER.** Glass, A.J. Lawrence Livermore National Lab., CA (United States). Jul 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9204146–6: Fusion Power Associates annual meeting and symposium, Pleasanton, CA (United States), 9 Apr 1992). Order Number DE93011900. Source: OSTI; NTIS; GPO Dep.

In 1987, the United States, Japan, Western Europe, and the Soviet Union combined forces to undertake the design, development, and construction of the world's first power-producing magnetic fusion reactor. This project is called the International Thermonuclear Experimental Reactor (ITER) The overall objective of the ITER project is to demonstrate the scientific and technological feasibility of fusion power for peaceful purposes. In order to accomplish this overall objective, ITER has a three-fold mission. The physics mission is to demonstrate controlled ignition and extended burn of a deuterium-tritium (D-T) plasma with an ultimate goal of steady-state or continuous operation. The technology mission is to demonstrate technologies essential to the development of a demonstration reactor in an integrated system. The testing mission is to perform integrated testing of the high heat flux and nuclear components required for the use of fusion power for practical purposes.

25334 (UCRL-JC–111382) **Opportunities for US industry in the ITER project.** Glass, A.J. Lawrence Livermore National Lab., CA (United States). Jul 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9204146–5: Fusion Power Associates annual meeting and symposium, Pleasanton, CA (United States), 9 Apr 1992). Order Number DE93011901. Source: OSTI; NTIS; GPO Dep.

Elsewhere in this meeting we've discussed the technical objectives of ITER, but one of the immediate objectives of the Engineering Design Activities (EDA) of the ITER project is to prepare

industry in all four participating national groups to bid on the construction of the ITER facility. Accordingly, participation of industry in the EDA is of critical importance to the project. Even if ITER is not constructed, other facilities of comparable scale will be built by one or another of the Parties. Clearly, industrial capabilities are required for a project of this magnitude. Furthermore, to obtain the necessary base of public support and financing for a project of this size requires a broad base of support which cannot be developed without industry's active participation. Of course, ITER is only one step towards the developmentof fusion energy.

25335 (UCRL-JC–111389) **The role of ITER in the US MFE Program Strategy.** Glass, A.J. Lawrence Livermore National Lab., CA (United States). Jul 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920606–44: American Nuclear Society annual meeting, Boston, MA (United States), 7-12 Jun 1992). Order Number DE93009290. Source: OSTI; NTIS; INIS; GPO Dep.

I want to discuss the role of ITER in the US MFE Program Strategy. I should stress that any opinions I present are purely my own. I'm not speaking ex cathedra, I'm not speaking for the ITER Home Team, and I'm not speaking for the Lawrence Livermore National Laboratory. I'm giving my own personal opinions. In discussing the role of ITER, we have to recognize that ITER plays several roles, and I want to identify how ITER influences MFE program strategy through each of its roles.

25336 (UCRL-JC–113199) **High-field conductor testing at the FENIX facility.** Shen, S.S.; Chaplin, M.R.; Felker, B.; Hassenzahl, W.V.; Kishiyama, K.I.; Parker, J.M. Lawrence Livermore National Lab., CA (United States). 5 Apr 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9303157–1: 8. United States-Japan workshop on high-field superconductors Applied Superconducting Center, Madison, WI (United States), 16-19 Mar 1993). Order Number DE93012318. Source: OSTI; NTIS; INIS; GPO Dep.

The Fusion Engineering International experiments (FENIX) Test Facility, which was commissioned at the end of 1991, is the first facility in the world capable of testing prototype conductors for the International Thermonuclear Experimental Reactor (ITER) superconducting magnets. The FENIX facility provides test conditions that simulate the ITER magnet operating environment; more importantly, it also accommodates specific experiments to determine the operational margins for the prototype conductors. The FENIX facility generates magnetic fields close to 14 T, and transport currents over 40 kA for testing the prototype conductors. This paper describes an experimental program that measures critical currents, current-sharing temperatures, forced-flow properties, and cyclic effects.

25337 (UCRL-LR–105821-92-4) **Inertial confinement fusion: Quarterly report, July–September 1992: Volume 2, Number 4.** Powers, L.; Condouris, R.; Kotowski, M.; Murphy, P.W. (eds.). Lawrence Livermore National Lab., CA (United States). 1992. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93013303. Source: OSTI; NTIS; GPO Dep.

This issue of the ICF Quarterly contains seven articles that describe recent progress in Lawrence Livermore National Laboratory's ICF program. The Department of Energy recently initiated an effort to design a 1–2 MJ glass laser, the proposed National Ignition Facility (NIF). These articles span various aspects of a program which is aimed at moving forward toward such a facility by continuing to use the Nova laser to gain understanding of NIF-relevant target physics, by developing concepts for an NIF laser driver, and by envisioning a variety of applications for larger ICF facilities. This report discusses research on the following topics: Stimulated Rotational Raman Scattering in Nitrogen; A Maxwell Equation Solver in LASNEX for the Simulation of Moderately Intense Ultrashort Pulse Experiments; Measurements of Radial Heat-Wave Propagation in Laser-Produced Plasmas; Laser-Seeded Modulation Growth on Directly Driven Foils; Stimulated Raman Scattering in Large-Aperture, High-Fluence Frequency-Conversion Crystals; Fission Product Hazard Reduction Using Inertial Fusion Energy; Use of Inertial Confinement Fusion for Nuclear Weapons Effects Simulations.

99 GENERAL AND MISCELLANEOUS

25338 (UCRL-ID–112855) **Ghostly events: A review of the namesakes of LLNL nuclear tests of the past few years.** Olsen, C.W. Lawrence Livermore National Lab., CA (United States). Feb 1993. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93011720. Source: OSTI; NTIS; GPO Dep.

Beginning in Fiscal Year 1986, the LLNL named its tests at the Nevada Test Site for ghost towns and other historical place names in California and Nevada. The first test so named was GOLDSTONE conducted on December 28, 1985. The list of names was used until recently when a new set of names was adopted for use in FY-93 and later. The locations used for event names often had interesting histories of their own. Some sites have virtually disappeared, some are still identifiable ghost towns, some never were towns, and others are relatively recent or still inhabited locations. This paper is a compilation of brief histories of the locations for which tests were named. The towns mostly, but not entirely, date from the mining booms of about 1850 to the early twentieth century. Many of these communities had brief existences; populations ranged from a few hardy souls to several thousand, and amenities ranged from primitive to, in a few rare cases, opulent. The development tended to follow a similar pattern based on size and duration of activity, usually starting with a collection of tents, commonly known as "rag-towns". Generally even the small communities soon had a store, some sort of lodging, and a saloon and gambling hall. As towns grew, if they lasted long enough, they would often acquire a post office, more saloons and stores, better water supplies and transportation, more permanent hotels, sometimes a newspaper, and often a red-light district. This was followed finally by permanent residences and by churches and schools, possibly even a library, and the other trappings of a real community; the ultimate goal was to have a court house. Most sites, of course, went through boom and bust before the full cycle could be realized. These places are the remains of a fascinating and important part of our heritage.

25339 (CNIC–00600) **China nuclear science and technology report (1991). Abstracts.** China Nuclear Information Centre, Beijing, BJ (China). Apr 1992. [78p.] (In Chinese). Order Number DE93626608. Source: OSTI; NTIS (US Sales Only); INIS.

The bibliographies and abstracts of China Nuclear Science and Technology Reports published in 1991 (Report Numbers CNIC-00455 to CNIC-00554) are presented. The items are arranged according to INIS subject categories, which mainly are physics, chemistry, materials, earth sciences, life sciences, isotopes, isotope and radiation applications, engineering and technology, and other aspects of nuclear energy. The numbers on the left corners of the entries are report numbers, and on the right corners the serial numbers. A report number index is annexed.

25340 (CONF-9110444–2) **Automated knowledge acquisition for second generation knowledge base systems: A conceptual analysis and taxonomy.** Williams, K.E.; Kotnour, T. Virginia Polytechnic Inst., Blacksburg, VA (United States). [1991]. 8p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract FG02-91NP00119. N00014-91-J-1500. From 27. annual meeting of the Institute of Management Sciences; Myrtle Beach, SC (United States); 3-4 Oct 1991. Order Number DE93010317. Source: OSTI; NTIS; GPO Dep.

In this paper, we present a conceptual analysis of knowledge-base development methodologies. The purpose of this research is to help overcome the high cost and lack of efficiency in developing knowledge base representations for artificial intelligence applications. To accomplish this purpose, we analyzed the available methodologies and developed a knowledge-base development methodology taxonomy. We review manual, machine-aided, and machine-learning methodologies. A set of developed characteristics allows description and comparison among the methodologies. We

present the results of this conceptual analysis of methodologies and recommendations for development of more efficient and effective tools.

25341 (CONF-9205327–1) **Addressing problems and implementation issues of self-managing teams.** Van Aken, E.M.; Sink, D.S. Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States). Dept. of Industrial and Systems Engineering. [1992]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91NP00119. From International industrial engineering conference; Chicago, IL (United States); May 1992. Order Number DE93010316. Source: OSTI; NTIS; GPO Dep.

In response to the significant challenges organizations face today, many managers have put in place continuous improvement efforts to help the organization enhance its competitive position. A key element of continuous improvement efforts is employee involvement; in a recent survey of Fortune 500 organizations on techniques and approaches to improving quality and productivity, respondents listed employee involvement as their number one priority. One of the more complex and mature forms of employee involvement which many organizations have begun to experiment with recently is self-managing teams. A self-managing team is a group of employees, usually eight to fifteen, who is responsible for not only performing work tasks but also managing their work processes. There are common problems and issues associated with implementing self-managing teams, which we will address in this paper. First, however, we will discuss how self-managing teams fit into the broader concept of employee involvement. Then we will describe the results of a case study research project studying how five organizations implemented self-managing teams. The implementation issues we address are the role of the supervisor, the structure of teams, the information requirements of the g necessary, and the compensation (pay) system most often used. Lastly, we will discuss some future trends for self-managing teams.

25342 (CONF-9209334–1) **Information requirements of self-managing teams.** Van Aken, E.M. Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States). Dept. of Industrial and Systems Engineering. [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91NP00119. From International conference on self-managing teams; Dallas, TX (United States); Sep - oct 1992. Order Number DE93010319. Source: OSTI; NTIS; GPO Dep.

In response to the significant challenges organizations face today, many managers have put in place continuous improvement efforts to help the organization on enhance its competitive position. A key element of continuous improvement efforts is employee involvement, and one of the most complex, mature, and effective forms of employee involvement is self-managing teams. A self-managing team is a group of employees, usually eight to fifteen, which is responsible for planning, implementing, controlling, and improving work processes. There are many characteristics of self-managing teams which are discussed frequently in the literature and are common topics of seminars and workshops on SMTs, including the role of the first-line supervisor, the structure of teams, the training necessary, and the pay system for SMTs. However, one area which has not been as widely researched is the role of information - what types of information do self-managing teams need? This paper addresses this question. Results from a multiple case study research project focusing on the information requirements of SMTs are presented. Specifically, seven types of information SMTs need are identified, as well as general characteristics of the information system. By information system, I mean very broadly, the system (both formal and informal) which provides information of any kind to a self-managing team. The results of this research can be thought of as "design features" for an information system to support SMTs. Practicing managers can use these design features in two ways: they can design them into beginning SMT efforts; or, for SMTs already established, managers can compare them to the existing information system and adjust accordingly.

25343 (DOE/OR/00033–T528) **Training implications of selected DOE orders resource guide.** Oak Ridge Inst. for Science and Education, TN (United States). Nov 1992. 478p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-76OR00033. Order Number DE93013318. Source: OSTI; NTIS; GPO Dep.

The Training Resources and Data Exchange (TRADE) is a network that encourages and facilitates the exchange of ideas, techniques, and resources for improving training and development and serves as a forum for the discussion of issues of interest to the US Department of Energy (DOE) community. TRADE encompasses a wide range of activities which include: conferences, workshops, and meetings; special interest groups; resource guides, curriculum development, and good practices publications; training resources directories for the DOE system; and electronic bulletin board services. This resource guide, which updates one published in January 1988, is intended to be used by DOE and DOE contractor personnel in identifying and responding to training requirements established in DOE Orders. The requirements addressed in this guide relate primarily to environment, safety, and health issues; therefore, the guide does not address every DOE Order. The DOE Orders and other guidance documents addressed in this guide are listed in the Table of Contents. Several orders were in draft at the time of publication and are indicated as draft. This guide also contains training implications of several DOE manuals.

25344 (ES/ER/TM–61) **Environmental Restoration Program pollution prevention performance measures for FY 1993 and 1994 remedial investigations: Management training manual.** Oak Ridge National Lab., TN (United States); Weston (Roy F.), Inc., Oak Ridge, TN (United States). Mar 1993. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ;AC05-76OR00001. Order Number DE93010833. Source: OSTI; NTIS; INIS; GPO Dep.

This computer-based program is designed to help waste generators in the Environmental Restoration (ER) Program prevent pollution at the DOE Oak Ridge Field Office (DOE-OR) facilities in Oak Ridge, Paducah, and Portsmouth. The Numerical Scoring System (NSS) is an interactive system designed to maintain data on ER Program pollution prevention efforts and to measure the success of these efforts through the ER Program life cycle.

25345 (EUR–14755) **Annual Report 1991. Institute for systems engineering and informatics.** Commission of the European Communities, Luxembourg (Luxembourg). 1992. [128p.] Source: OSTI; NTIS (US Sales Only); INIS.

The report presents the achievements of the Institute for Systems Engineering and Informatics (ISEI) of the Joint Research Centre (JRC) of the Commission of the European Communities (CEC) for 1991. The JRC is a European scientific and technical research centre established by the member states of the CEC. Its four sites in Belgium (Geel), Germany (Karlsruhe), the Netherland (Petten) and Italy (Ispra) house 8 institutes, each with its own focus of expertise. ISEI, based at Ispra, was created in 1990 by the merger of the Institute for Systems Engineering (ISE) and the Centre for Information Technologies and Electronics (CITE). The main areas of activity of the Institute are: - Industrial and Environmental Risk, - Nuclear Safeguards, -Fusion Reactor Systems Integration and Safety, - Solar Energy Systems and Energy Management, - Advanced Computing, - Informatic services.

25346 (IAEA-CPE–92/01) **The Agency's Technical Co-operation programme in Chile, 1981-1991. Country programme evaluation.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 14 Apr 1992. [127p.] Order Number DE93624728. Source: OSTI; NTIS (US Sales Only); INIS.

Agency support for nuclear activities in Chile dates back to the early 1960s. During the last ten years, this support has considerably expanded. In 1981-1991, 62 Agency projects with allotments amounting to over $7 million were completed or are under implementation. Chile has received 360 man-months of expert services, $3.4 million worth of equipment, and 105 fellowships for some 390 man-months of training. In addition, 262 Chileans attended 219 Agency regional and interregional training courses, and Chilean institutions were awarded 40 research contracts worth over $325,000. This evaluation covers ten years of Agency technical co-operation with Chile, during which 35 projects were completed and 27 are still being implemented. Eight major sectors received assistance: general atomic energy development; nuclear physics; nuclear raw

materials; nuclear engineering and technology; nuclear techniques in agriculture; nuclear medicine; hydrology; and nuclear safety. The evaluation concluded that, overall, the Agency's technical co-operation activities have, in keeping with the national priorities concerning peaceful nuclear applications, contributed substantially to the establishment of Chile's nuclear scientific and technical infrastructure, and played a major role in Chile's efforts to introduce nuclear applications in a number of sectors of the economy, with many benefits for broader national development objectives. Another strength of the Agency's programme with Chile is the high level of commitment and dedication that was noted in the great majority of recipient institutions, and in particular at the Comision Chilena de Energia Nuclear, CChEN. Mention should also be made of the fact that bureaucracy appears to be less severe than in some other developing countries, and that constraints that frequently affect other countries, such as insufficient counterpart commitment and lack of continuity of personnel, are considerably less acute.

25347 (IAEA-CPS–92/01) **The Agency's Technical Co-operation programme with Costa Rica, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 2 Apr 1992. [39p.] Order Number DE93624729. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With over $2.8 million of Agency support received, Costa Rica ranks 49th among all recipients of technical assistance in the period 1958-1991. Over half of the assistance during the past ten years has been provided in the form of equipment (52%), followed by expert services (37%) and training (11%). Sixty-two per cent of the resources were made available through the Technical Assistance and Co-operation Fund, while 37% of the resources were provided by UNDP. The rest was made available through extrabudgetary contributions (5%) and through in-kind assistance (1%). With regard to project disbursement by sector, the largest areas have been nuclear raw materials (36%), nuclear physics and chemistry (24%) and agriculture (20%). Smaller shares have gone to hydrology (11%) and nuclear medicine (8%).

25348 (IAEA-CPS–92/02) **The Agency's Technical Co-operation programme with Cuba, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 2 Apr 1992. [43p.] Order Number DE93624730. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With almost $8.2 million of Agency support received, Cuba ranks 19th among all recipients of technical assistance in the period 1958 - 1991, whereby it ranked as high as 3rd in 1982 and 4th in 1984. Over three quarters of the assistance during the past ten years has been provided in the form of equipment (81%), followed by expert services (10%) and training (9%). Seventy-one per cent of the resources were made available through the Technical Assistance and Co-operation Fund, while 28% of the resources were provided by UNDP. The remaining 1% was made available through extrabudgetary and in-kind contributions. With regard to project disbursements by sector, the largest areas have been general atomic energy development (36%), agriculture (20%), nuclear physics and chemistry (10%) and nuclear safety (10%). Industry and hydrology, nuclear engineering and technology, and nuclear medicine have each received less than ten per cent of the assistance provided.

25349 (IAEA-CPS–92/03) **The Agency's Technical Co-operation programme with Peru, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 2 Apr 1992. [54p.] Order Number DE93624731. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With over $12.6 million of Agency support received, Peru ranks 4th among all recipients of technical assistance in the period 1958 - 1991, whereby it ranked as high as 2nd in each of the four years 1982 through 1985. More than half of the assistance during the past ten years has been provided in the form of equipment (59%), followed by expert services (29%) and training (12%). Forty-five per cent of the resources were provided by the Technical Assistance and Co-operation Fund, while 29% of the resources were made available through extrabudgetary contributions, and 21% by UNDP. The remaining 5% were provided in kind. With regard to project disbursement by sector, the largest areas have been agriculture (27%), general atomic energy development (17%), nuclear raw materials (14%), nuclear medicine (12%) and industry and hydrology (11%). Nuclear safety, nuclear engineering and technology, and nuclear physics and chemistry have each received less than ten per cent of the assistance provided.

25350 (IAEA-CPS–92/04) **The Agency's Technical Co-operation programme with Uruguay, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 2 Apr 1992. [45p.] Order Number DE93624732. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With over $4.2 million of Agency support received, Uruguay ranks 37th among all recipients of technical assistance in the period 1958 - 1991. More than half of the assistance during the past ten years has been provided in the form of equipment (67%), followed by expert services (19%) and training (14%). Seventy-three per cent of the resources were provided through the Technical Assistance and Co-operation Fund, while 24% were made available through extrabudgetary contributions. The remaining 3% were provided through assistance in kind, with only an insignificant contribution by UNDP. With regard to project disbursement by sector, the largest areas have been nuclear medicine (35%), agriculture (23%), general atomic energy development (17%), followed by nuclear physics and chemistry (11%) and industry and hydrology (7%).

25351 (IAEA-CPS–92/05) **The Agency's Technical Co-operation programme with Guatemala, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 7 Apr 1992. [40p.] Order Number DE93624733. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With over $3 million of Agency support received, Guatemala ranks 46th among all recipients of technical assistance in the period 1958 - 1991. Almost three quarters of the assistance during the past ten years has been provided in the form of equipment (72%), followed by training (15%) and expert services (13%). Seventy-eight per cent of the resources were provided by the Technical Assistance and Co-operation Fund, the rest was made available through extrabudgetary contributions (21%) and assistance in kind (1%). With regard to project disbursement by sector, the largest areas have been nuclear physics and chemistry (37%), agriculture (28%), nuclear medicine (16%) and hydrology (8%). The remaining 11% were shared by general atomic energy development, nuclear raw materials, nuclear engineering and technology, and nuclear safety.

25352 (IAEA-CPS–92/06) **The Agency's Technical Co-operation programme with the United Republic of Tanzania, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 19 Jun 1992. [35p.] Order Number DE93624734. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With over $ 3.4 million of Agency support received, the United Republic of Tanzania ranks 44th among all recipients of technical assistance in the period 1958 - 1991. Almost half of the assistance during the past ten years has been provided in the form of equipment (49%), followed by training through fellowships and scientific visits (29%) and expert services (22%). Ninety-two per cent of the resources were provided by the Technical Assistance and Co-operation Fund, the rest was made available through assistance in kind (5%) and through extrabudgetary contributions (3%). With regard to project disbursement by sector, by far the largest share has gone to agriculture (48%), followed by nuclear physics (20%), nuclear safety (17%) and nuclear medicine (11%).

25353 (IAEA-CPS–92/07) **The Agency's Technical Co-operation programme with Senegal, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 22 Jun 1992. [36p.] Order Number DE93624735. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With $2.2 million of Agency support received, Senegal ranks 56th among all recipients of technical assistance in the period 1958 - 1991. More than one-third of the assistance during the past ten years has been provided in the form of equipment (67%), followed by expert services (21%) and training (12%). Eighty per cent of the resources were provided by the Technical Assistance and Co-operation Fund, while 16% were made available by UNDP and about 2% each through extrabudgetary contributions and assistance in kind. With regard to project disbursement by sector, by far the largest area has been agriculture (43%). Smaller shares have gone to general atomic energy development (15%), nuclear physics and chemistry (13%), nuclear medicine and hydrology (11% each), and nuclear safety (7%).

25354 (IAEA-CPS–92/08) **The Agency's Technical Co-operation programme with Ghana, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 24 Jun 1992. [42p.] Order Number DE93624736. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With over $6.5 million of Agency support received, Ghana ranks 29th among all recipients of technical assistance in the period 1958 - 1991. More than half of the assistance during the past ten years has been provided in the form of equipment (53%), followed by training through fellowships and scientific visits (34%) and expert services (13%). Seventy-four per cent of the resources were provided by the Technical Assistance and Co-operation Fund, 13% through assistance in kind, 11% through extrabudgetary contributions, and 2% by UNDP. It should be noted that the share for extrabudgetary contributions includes an amount of $250,000 made available by the Ghanaian Government for the purchase of equipment by the Agency under a funds-in-trust arrangement. With regard to project disbursement by sector, the largest share has gone to agriculture (36%), followed by nuclear physics and chemistry (21%), nuclear medicine (16%), industry and hydrology (14%) and nuclear engineering and technology (9%).

25355 (IAEA-CPS–92/09) **The Agency's Technical Co-operation programme with Egypt, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 26 Jun 1992. [68p.] Order Number DE93624737. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With over $22.2 million of Agency support received, Egypt ranks first among all recipients of technical assistance, not only for the period 1958 - 1991, but also held this rank in each of the five years 1982 through 1986 and in 1988. More than half of this assistance has been provided in the form of equipment (57%), followed by expert services (19%), training (17%) and sub-contracts (7%). With 42% and 43%, respectively, the Technical Assistance and Co-operation Fund and extrabudgetary contributions hold almost equal shares in the total resources available, while in-kind assistance accounts for 9% and UNDP for 6% of the resources. With regard to project disbursement during the past ten years, by sector, the two largest areas have been nuclear safety (34%) and agriculture (33%), followed by nuclear engineering and technology (11%). Smaller shares - from 4% to 7% each– have gone to industry and hydrology, nuclear medicine, nuclear physics and chemistry, and general atomic energy development.

25356 (IAEA-CPS–92/10) **The Agency's Technical Co-operation programme with Nigeria, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 3 Sep 1992. [48p.] Order Number DE93624738. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With over $9.3 million of Agency support received, Nigeria ranks 14th among all recipients of technical assistance in the period 1958 through 1991. During the past ten years, 44% of this assistance has been provided in the form of equipment, followed by training (27%), expert services (26%) and sub-contracts (3%). With 45% and 44%, respectively, the Technical Assistance and Co-operation Fund and extrabudgetary contributions hold almost equal shares in the total resources made available, while in-kind assistance accounts for 9% and UNDP for 2% of the resources. With regard to project disbursement during the past ten years, by sector, by far the largest area has been agriculture (70%), with significantly smaller shares going to nuclear physics and chemistry (11%), nuclear medicine (8%) and nuclear safety (7%).

25357 (IAEA-CPS–92/11) **The Agency's Technical Co-operation programme with Sudan, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 8 Sep 1992. [42p.] Order Number DE93624739. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With over $5.7 million of Agency support received, Sudan ranks 31st among all recipients of technical assistance in the period 1958 through 1991. Over the past ten years, almost equal shares of this assistance were provided in the form of equipment (46%) and training (42%), and only a small percentage was provided in the form of expert services (12%). The best part of the resources was made available through the Technical Assistance and Co-operation Fund (77%), while in-kind and extrabudgetary contributions account for 13% and 10% of the resources, respectively. With regard to project disbursement during the past ten years, by sector, the two largest areas have been general atomic energy development (37%) and agriculture (21%), followed by nuclear medicine (14%). Smaller shares (6% each) have gone to nuclear physics and chemistry, nuclear engineering and technology, hydrology, and nuclear safety.

25358 (IAEA-CPS–92/12) **The Agency's Technical Co-operation programme with Zaire, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 14 Sep 1992. [39p.] Order Number DE93624740. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With $3.9 million of Agency support received, Zaire ranks 38th among all recipients of technical assistance in the period 1958 through 1991. More than half of the assistance during the past ten years has been provided in the form of equipment (60%), followed by training (24%) and expert services (16%). With a share of 76%, the Technical Assistance and Co-operation Fund has provided more than three quarters of the total resources available, while only small shares were made available through UNDP (11%), extrabudgetary contributions (4%) and assistance in kind (9%). With regard to project disbursements during the past ten years, by sector, the largest area has been general atomic energy development (26%), followed by agriculture (18%), nuclear safety (18%), nuclear techniques in industry and hydrology (13%), and nuclear physics and chemistry (11%).

25359 (IAEA-CPS–92/13) **The Agency's Technical Co-operation programme with Zambia, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 16 Sep 1992. [39p.] Order Number DE93624741. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With $5.5 million of Agency support received, Zambia ranks 33rd among all recipients of technical assistance in the period 1958 through 1991. More than half of the assistance during the past ten years has been provided in the form of equipment (61%), followed by expert services (25%) and training (14%). Almost all of the resources made available came from the Technical Assistance and Co-operation Fund (93%), with only very

small shares provided through extrabudgetary contributions (4%) and assistance in kind (3%). With regard to project disbursements during the past ten years, by sector, the largest areas have been agriculture (33%) and general atomic energy development (23%), followed by industry and hydrology (19%), nuclear raw materials (13%) and nuclear safety (6%).

25360 (IAEA-CPS–92/14) **The Agency's Technical Co-operation programme with Algeria, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 10 Nov 1992. [40p.] Order Number DE93624742. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With $3.6 million of Agency support received, Algeria ranks 41st among all recipients of technical assistance in the period 1958-1991. Seventy per cent of the assistance received during the past ten years has been in the form of equipment, followed by expert services (17%) and training (13%). Almost all of the resources were provided by the Technical Assistance and Co-operation Fund (97%), the remaining 3% were made available through assistance in kind. With regard to project disbursement by sector, the three major areas have been nuclear physics and chemistry (28%), agriculture (27%) and nuclear medicine (20%).

25361 (IAEA-CPS–92/15) **The Agency's Technical Co-operation programme with Kenya, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 10 Nov 1992. [37p.] Order Number DE93624743. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With almost $3.9 million of Agency support received, Kenya ranks 39th among all recipients of technical assistance during the period 1958-1991. Almost half of the assistance during the past ten years has been provided in the form of the equipment (44%), followed by training (33%) and expert services (23%). Two-thirds of the funds available were provided by the Technical Assistance and Co-operation Fund (66%), while extrabudgetary contributions accounted for 18%, in-kind contributions for 14%, and UNDP for 2% of the resources. With regard to project disbursements during the past ten years, by sector, the four major areas have been general atomic energy development (30%), agriculture (22%), nuclear medicine and nuclear safety (13% each).

25362 (IAEA-CPS–92/16) **The Agency's Technical Co-operation programme with Madagascar, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 12 Nov 1992. [32p.] Order Number DE93624744. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With over $3.5 million of Agency support received, Madagascar ranks 42nd among all recipients of technical assistance in the period 1958 through 1991. More than half of the assistance during the past ten years has been provided in the form of equipment (55%), followed by expert services (32%) and training (13%). With a share of 69%, the Technical Assistance and Co-operation Fund has provided more than two-thirds of the total resources available, while 29% were made available through UNDP and 2% through assistance in kind. Extrabudgetary contributions accounted for less than one per cent. With regard to project disbursements during the past ten years, by sector, by far the largest area has been nuclear raw materials (66%), followed by nuclear physics and chemistry (18%). Only small shares have gone to nuclear safety (7%), agriculture (5%) and nuclear engineering and technology (4%).

25363 (IAEA-CPS–92/17) **The Agency's Technical Co-operation programme with Mali, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 12 Nov 1992. [34p.] Order Number DE93624745. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With over $2.7 million of Agency support received, Mali ranks 51st among all recipients of technical assistance in the period 1958 through 1991. More than half of the assistance during the past ten years has been provided in the form of equipment (58%), followed by expert services (27%) and training (15%). With a share of 93%, the Technical Assistance and Co-operation Fund has provided the best part of the resources, while only very small shares were made available through extrabudgetary contributions and assistance in kind (5% and 2%, respectively). With regard to project disbursements during the past ten years, by sector, the four major areas have been hydrology (31%), nuclear medicine (24%), agriculture (21%) and nuclear raw materials (16%).

25364 (IAEA-CPS–92/18) **The Agency's Technical Co-operation programme with Cameroon, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 18 Nov 1992. [33p.] Order Number DE93624746. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With $1.3 million of Agency support received, Cameroon ranks 68th among all recipients of technical assistance in the period 1958 through 1991. More than half of the assistance received during the past ten years has been provided in the form of equipment (61%), followed by expert services (24%) and training (15%). The best part of the resources were provided by the Technical Assistance and Co-operation Fund (90%); the remaining ten per cent were made available through extrabudgetary contributions (8%) and assistance in kind (2%). With regard to project disbursements by sector, the four major areas have been nuclear physics and chemistry (38%), agriculture (23%), nuclear medicine (14%) and hydrology (13%).

25365 (IAEA-CPS–92/19) **The Agency's Technical Co-operation programme with Cote d'Ivoire, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 18 Nov 1992. [31p.] Order Number DE93624747. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With over $1.7 million of Agency support received, Cote d'Ivoire ranks 60th among all recipients of technical assistance in the period 1958 through 1991. Over half of the assistance received during the past ten years has been in the form of equipment (59%), complemented by expert services (26%) and training (15%). The best part of the resources was provided by the Technical Assistance and Co-operation Fund (91%), the remainder was made available through extrabudgetary contributions (7%) and through assistance in kind (2%). During the past ten years, project activities - and disbursements - have concentrated exclusively on three major areas: agriculture (59%), general atomic energy development (30%) and nuclear safety (11%).

25366 (IAEA-CPS–92/20) **The Agency's Technical Co-operation programme with Ethiopia, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 18 Nov 1992. [33p.] Order Number DE93624748. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With some $2.5 million of Agency support received, Ethiopia ranks 54th among all recipients of technical assistance in the period 1958 through 1991. More than half of the assistance received during the past ten years has been provided in the form of equipment (55%), complemented by expert services (16%) and training (29%). The best part of the resources was provided by the Technical Assistance and Co-operation Fund (88%), the remainder was made available through assistance in kind (6%), UNDP and extrabudgetary contributions (3% each). During the past ten years, project disbursements went to four major areas: agriculture (45%), nuclear medicine (35%), nuclear safety (14%) and nuclear engineering and technology (6%).

25367 (IAEA-CPS–92/21) **The Agency's Technical Co-operation programme with Niger, 1982-1992. Country**

programme summaries. International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 20 Nov 1992. [33p.] Order Number DE93624749. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With some $1.5 million of Agency support received, Niger ranks 65th among all recipients of technical assistance in the period 1958 through 1991. About two-thirds of the assistance received during the past ten years has been provided in the form of equipment (62%), complemented by expert services (26%) and training (12%). Almost the entire resources utilized were provided by the Technical Assistance and Co-operation Fund (96%), with only a small share made available through assistance in kind (4%). With regard to project disbursements by sector, the four major areas have been agriculture (34%), general atomic energy development (31%), hydrology (18%) and nuclear safety (12%).

25368 (IAEA-CPS–92/22) **The Agency's Technical Co-operation programme with Sierra Leone, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 20 Nov 1992. [31p.] Order Number DE93624750. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With over $1.1 million of Agency support received, Sierra Leone ranks 70th among all recipients of technical assistance in the period 1958 through 1991. Almost equal shares of the assistance during the past ten years have been provided in the form of equipment (40%) and expert services (37%), while the share of the training component was 23%. The best part of the resources was provided by the Technical Assistance and Co-operation Fund (96%), the remaining 4% was made available through assistance in kind. During the past ten years, project activities - and disbursements - have concentrated exclusively on three major areas: nuclear medicine (52%), general atomic energy development (25%) and agriculture (23%).

25369 (IAEA-CPS–92/23) **The Agency's Technical Co-operation programme with Uganda, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 20 Nov 1992. [33p.] Order Number DE93624751. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With $1.6 million of Agency support received, Uganda ranks 61st among all recipients of technical assistance in the period 1958 through 1991. Almost half of the assistance received during the past ten years has been provided in the form of equipment (47%), complemented by a strong training component (37%), while expert services have received only a relatively small share (16%). Ninety-eight per cent of the resources were provided by the Technical Assistance and Co-operation Fund, the remaining two per cent were made available through assistance in kind. During the past ten years, project activities - and disbursements - have concentrated exclusively on three major areas: agriculture (64%), nuclear medicine (24%) and nuclear safety (12%).

25370 (IAEA-CPS–92/24) **The Agency's Technical Co-operation programme with Mexico, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 2 Dec 1992. [65p.] Order Number DE93624752. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With almost $7.7 million of Agency support received, Mexico ranks 21st among all recipients of technical assistance during the period 1958 through 1991. The largest share of the assistance received during the past ten years has been in the form of expert services (36%), followed by equipment and training (27% each) and sub-contracts (10%). Almost two-thirds of the funds available were provided by the Technical Assistance and Co-operation Fund (65%), the rest was made available through extrabudgetary contributions (21%) and assistance in kind (14%). With regard to project disbursements during the past ten years, by sector the five major areas have been nuclear safety (34%), nuclear engineering and technology (27%), agriculture (17%), nuclear physics and chemistry (9%), and nuclear techniques in industry and hydrology (9%).

25371 (IAEA-CPS–92/25) **The Agency's Technical Co-operation programme with Brazil, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 10 Dec 1992. [69p.] Order Number DE93624753. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With over $17 million of Agency support received, Brazil ranks 2nd among all recipients of technical assistance during the period 1958 through 1991. Over half of the assistance received during the past ten years has been provided in the form of equipment (51%), complemented by expert services (34%) and training (15%). Almost two-thirds of the funds were made available through the Technical Assistance and Co-operation Fund (63%), the rest was provided through extrabudgetary contributions (30%), assistance in kind (4%) and UNDP (3%). With regard to total disbursements - by sector - under those projects that were operational during the period 1982 through November 1992, the three major areas have been: general atomic energy development (47%), nuclear safety (22%) and agriculture (13%). During the same period, the country has provided experts and training course lectures for a total of 405 assignments, and has hosted 178 fellowships and scientific visits as well as 46 regional and interregional training events with a total of 603 participants.

25372 (IAEA-CPS–92/26) **The Agency's Technical Co-operation programme with Argentina, 1982-1992. Country programme summaries.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 18 Dec 1992. [50p.] Order Number DE93624754. Source: OSTI; NTIS (US Sales Only); INIS.

The country programme summary reported here is one in the series of such studies being undertaken of the Agency's TC programme with Member States. With over $7.5 million of Agency support received, Argentina ranks 22nd among all recipients of technical assistance during the period 1958 through 1991. Forty-six per cent of the assistance received during the past ten years has been provided in the form of equipment, complemented by expert services (40%) and training (14%). The largest share of the resources was made available by UNDP (87%), and only small shares were provided through the TACF (12%) and assistance in kind (less than 1%). With regard to total disbursements - by sector - under those projects that were operational during the period 1982 through mid-December 1992, by far the largest area has been nuclear engineering and technology (91%), while only very small shares went to nuclear safety (4%), industry and hydrology (3%) and agriculture (2%). During the same period, the country has provided experts and training course lectures for a total of 601 assignments, and has hosted 153 fellowships and scientific visits as well as 42 regional and interregional training courses with a total of 568 participants.

25373 (IAEA-SE–92/01) **A special evaluation: The ARCAL programme.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 9 Nov 1992. [169p.] Order Number DE93624755. Source: OSTI; NTIS (US Sales Only); INIS.

The Regional Co-operative Arrangements for the Promotion of Nuclear Science and Technology in Latin America, ARCAL, came into being in 1983. At a meeting held in Vienna in September 1984, ten Latin American countries agreed to participate in the programme, the Guidelines setting up the structure of the programme were approved and nine areas of development were identified to initiate project activities. The programme, which is now in its second phase and in its ninth year of implementation, has 17 Member States and includes fifteen projects. Total disbursements under the ARCAL programme during the period 1983 - 1991 amounted to $8.5 million, including $5.4 million from the Technical Assistance and Co-operation Fund (TACF), $2.2 million from extrabudgetary sources, and some $0.9 million in the form of in-kind contributions. As of September 1992, equipment totaling $3.5 million, 385 man-months of expert services, and 108 fellowships for approximately 150 man-months of training had been provided to ARCAL Member

States within the context of fifteen ARCAL projects. In addition, 1844 Latin Americans were trained in 194 ARCAL training courses. The evaluation concluded that, as a result of the ARCAL programme, there is now better knowledge in participating countries about nuclear techniques and technology, as well as greater awareness at most levels of the importance of radiological safety and of the need to implement radiation protection measures, both a the national and at the regional level. The programme has contributed to developing and/or improving capabilities in the region in various applications of nuclear techniques through training activities. The programme has further allowed the establishment of regional collaborative links, particularly between countries with similar interests, in important fields of application, such as agriculture and nuclear medicine. Figs and tabs.

25374 (IAEA-SE–92/02) **Manpower development in Africa and the regional manpower development project RAF/0/003. Special evaluation.** International Atomic Energy Agency, Vienna (Austria). Evaluation Section. 16 Nov 1992. [95p.] Project RAF/0/003. Order Number DE93624756. Source: OSTI; NTIS (US Sales Only); INIS.

At the start of the Agency's technical co-operation activities in 1958, many of its developing Member States were just embarking on nuclear activities. To make basic nuclear training available for these countries became the first concern of the Agency and initially fellowships constituted more than 80% of the assistance provided. During the 1960s, fellowships represented more than 50% of the assistance provided to individual Member States. As counterpart institutions slowly build up small cadres of qualified staff, the share of training in the Agency's programme of technical co-operation became less dominant and, by 1986, only 22% of the funds were devoted to fellowships. In the Africa region, where the share of fellowship training provided to individual Member States had dropped even below the 20% mark, and where the participation in group training events was the lowest of any region, this was having serious consequences on manpower development. At least some opportunities exist in about 60% of the countries in the region for training in selected areas of nuclear science and technology, but only 20% of the countries provide training up to the MSc/PhD level. The number of trainees in nuclear science and technology graduating each year from national institutions is very small and cannot be considered adequate to satisfy existing manpower needs of the country concerned and of the region as a whole. Very few - if any - opportunities for nuclear training abroad are available for candidates from the region other than those funded by the Agency. There is very little awareness at the national level as to the actual training needs in the nuclear field in most countries of the region, underlining the importance of the role of the Agency, not only as a provider of training, but also as an adviser on assessing training needs at the time national development plans are established.

25375 (IAEA-TC-PM–004) **Country programme review. Mongolia.** Dolnicar, J.; Kamel, R.; Perera, O.; Tauchid, M. International Atomic Energy Agency, Vienna (Austria). Div. of Technical Co-operation Programmes. Aug 1992. [35p.] Project INT/0/053. Order Number DE93626610. Source: OSTI; NTIS (US Sales Only); INIS.

This document reviews the current nuclear program in Mongolia, identifying the peaceful uses of nuclear technology in the country and possible future technical co-operation activities. Separate brief sections deal with food and agriculture; mineral resources; nuclear chemistry, nuclear physics and instrumentation; human health; radiation protection; water resources and nuclear energy. 1 tab.

25376 (IAEA-TC-PM–005) **Country programme review. Guatemala.** International Atomic Energy Agency, Vienna (Austria). Div. of Technical Co-operation Programmes. Sep 1992. [25p.] Project INT/0/053. Order Number DE93626611. Source: OSTI; NTIS (US Sales Only); INIS.

This document reviews the current nuclear program in Guatemala, identifying the peaceful uses of nuclear technology in the country and possible future technical co-operation activities. Separate brief sections deal with food and agriculture; human health; radiation protection; industrial applications and hydrology; nuclear analytical techniques; nuclear instrumentation and nuclear information.

25377 (IAEA/UNDP–CPR-85/085-TR) **Manpower development for nuclear power programme. China. Project findings and recommendations: Terminal report. Report prepared for the Government of China.** Csik, B.J. (International Atomic Energy Agency, Vienna (Austria). Nuclear Power Engineering Section). International Atomic Energy Agency, Vienna (Austria); United Nations Development Programme. 1992. [66p.] Project CPR/4/003. Order Number DE93626612. Source: OSTI; NTIS (US Sales Only); INIS.

The United Nations Development Program (UNDP) project was conceived in April 1985, implementation was started on preliminary authorization by summer 1986, and it was approved and signed in early 1987. The duration was originally planned for three years with a UNDP input of US$ 1,657.500 (including Government cost sharing of US$ 280,000). The project is now essentially completed with a few items still pending, though committed as firmly planned, and the current cost estimate is US$ 1,707.617. The objective of the project was to assist in establishing long-term training programmes in two training centres in the People's Republic of China (Qinshan and Suzhou) and strengthen the training capabilities at these centres. The two centres are intended to provide specialized comprehensive training in basic and applied nuclear power engineering disciplines as well as in construction, operation and maintenance of nuclear power plants to technical personnel assigned to the nuclear power plants in the People's Republic of China.

25378 (INIS-BR–3127) **Technology development in materials working for nuclear sector and its consequences for the Brazilian market.** Volta, A.R. NUCLEN, Rio de Janeiro, RJ (Brazil). 1992. [8p.] (In Portuguese). (CONF-9210349–: 4. International Seminar on Technology Transfer; 1. Brazilian Congress on Technology Transfer, Rio de Janeiro (Brazil), 4-9 Oct 1992). Order Number DE93624758. Source: OSTI; NTIS (US Sales Only); INIS.

The technology transfer model adopted in materials development for Brazilian nuclear sector is described. Materials are very important for the industrial development and the National nuclear program has contributed with others areas, for example, metallurgical, siderurgical, equipment sectors, etc. Grafenrheinfeld Power Plant is used like reference plant for Angra-1, a Brazilian nuclear power plant. (M.V.M.).

25379 (NEI-DK–1143) **Latvian research: An international evaluation.** Danish Research Councils, Copenhagen (Denmark). Dec 1992. [710p.] Order Number DE93624759. Source: OSTI; NTIS; INIS.

The Latvian Council of Science asked the Danish Research Councils and the Danish Academy for Technical Sciences for help in evaluating Latvian scientific research. The background for this request was the Latvian desire to stimulate an approach towards full integration in the European society. Based on reports, site visits and interviews, 19 panels of experts covering all subject areas prepared evaluation reports. These detailed evaluations of actual research projects are included in the publication in addition to general recommendations. The panels recommend that Latvian authorities take into consideration when planning scientific research, especially with regard to those branches which contribute to the industrial development and social and economic sciences, that a balance should be made between long range basic, and short range applied, science activities. Despite the very serious economic conditions in Latvia, it was also advised that immediate measures should be taken to ensure a stable funding of the research system as the future development of Latvian society is dependent on the stability and high quality of its research activities. Other recommendations are given in detail. (AB).

25380 (ORAU–91/G-52) **Emergency management training program: Guide to good practice.** Oak Ridge Associated Universities, Inc., TN (United States). Jul 1991. 301p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-76OR00033. Order Number DE93013317. Source: OSTI; NTIS; GPO Dep.

The Emergency Management Training Program Guide to Good Practice is a project of the Training Resources and Data Exchange (TRADE) Emergency Management Issues Special Interest Group (EMI SIG). EMI SIG members expressed interest in a resource to assist in development of a comprehensive emergency management training program. This publication provides guidelines,

methods, and materials for EMI SIG members to use, assisting in complete and effective emergency management programs. The purposes of the Emergency Management Training Program Guide to Good Practice are: Provide guidance in the development and management of Emergency Management (EM) training programs; Assist EM trainers to incorporate components of the DOE Emergency Management System philosophy of planning, preparedness, readiness assurance, and response into EM training programs; Help EM training managers meet EM training requirements and conditions established by current regulations and policies; Supplement other TRADE EMI SIG documents and complement individual facility training documents. This program is designed for emergency management personnel who are responsible for providing or overseeing EM training but who do not necessarily possess expertise in developing training. It provides good practices from the manager's point of view on how to produce, administer, and document facility EM training programs in the spirit of the DOE EM system philosophy. Basic guidance is also included for personnel who design, develop, deliver, and/or evaluate EM training programs or parts. This guidance includes key points of EM training programs and identifies other documents that contain useful and/or more detailed training information.

25381 (POEF-T--3605) **Engineering performance metrics.** DeLozier, R. (Oak Ridge National Lab., TN (United States)); Snyder, N. Martin Marietta Energy Systems, Inc., Piketon, OH (United States). 31 Mar 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-76OR00001. (CONF-930768--1: 3. annual international symposium of the National Council on Systems Engineering, Arlington, VA (United States), 26-28 Jul 1993). Order Number DE93012084. Source: OSTI; NTIS; GPO Dep.

Implementation of a Total Quality Management (TQM) approach to engineering work required the development of a system of metrics which would serve as a meaningful msinagement tool for evaluating effectiveness in accomplishing project objectives and in achieving improved customer satisfaction. A team effort was chartered with the goal of developing a system of engineering performance metrics which would measure customer satisfaction, quality, cost effectiveness, and timeliness. The approach to developing this system involved normal systems design phases including, conceptual design, detailed design, implementation, and integration. The lessons teamed from this effort will be explored in this paper. These lessons teamed may provide a starting point for other large engineering organizations seeking to institute a performance measurement system accomplishing project objectives and in achieving improved customer satisfaction. To facilitate this effort, a team was chartered to assist in the development of the metrics system. This team, consisting of customers and Engineering staff members, was utilized to ensure that the needs and views of the customers were considered in the development of performance measurements. The development of a system of metrics is no different than the development of any type of system. It includes the steps of defining performance measurement requirements, measurement process conceptual design, performance measurement and reporting system detailed design, and system implementation and integration.

25382 (UTTAC--59) **Annual report of the Tandem Accelerator Center, University of Tsukuba: April 1, 1991 - March 31, 1992.** Furuno, K.; Shima, K.; Komatsubara, T. (eds.). Tsukuba Univ., Ibaraki (Japan). Tandem Accelerator Center. Sep 1992. 153p. Order Number DE93788277. Source: OSTI; NTIS; INIS.

This annual report includes the research activities and the technical developments carried out at the Tandem Accelerator Center in University of Tsukuba for the period from April 1991 to March 1992. Research activities covered the following subjects. Experimental investigations were made on (1) nuclear spectroscopy of high-spin rotational states and high-spin isomers in odd-odd nuclei, anomalous Fermi-coupling constant in the β decay of ^{35}Ar and the search for new isotopes around the mass number 90; (2) polarization phenomena in nuclear reactions; (3) the application of energetic heavy ions to solid state physics; (4) the properties of defects in metal produced by proton irradiation; (5) the magnetic properties of $LiVO_2$ by NMR; (6) off line Moessbauer studies; and (7) the mechanism of micro-cluster formation at the surface of material by heavy-ion bombardment. Theoretical work pertinent to the nuclear collective motion and the relativistic mean-field theory is also included in this report. (J.P.N.).

25383 (WHC-SA--1783) **Teamwork, taxes, and training: A case for cooperation and quality.** Hayward, G.B. Westinghouse Hanford Co., Richland, WA (United States). Jan 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-930278--4: 1993 American Society for Quality Control (ASQC) audit conference, Charlotte, NC (United States), 25-26 Feb 1993). Order Number DE93011279. Source: OSTI; NTIS; INIS; GPO Dep.

Training to ensure compliance with the myriad of laws and regulations imposed by federal, state, and local governments is a trend that will continue well into the 1990s. The cost of this training increasingly takes away from the bottom line of many companies and adds additional costs to the products and services being developed and sold. This cost is passed on to the consumer. When the government or one of its contractors incurs additional costs, they are passed on to the taxpayer. As budgets shrink and requirements go up it makes sense to find a way to maintain high quality and cut costs. The Quality Training and Resource Center was established at Hanford by the US Department of Energy to do just that; cut costs and maintain quality. This paper will explore the methodology used to establish a model based on contractor cooperation, teamwork, and resource sharing to improve training while Towering costs.

25384 (Y/DJ--35707) **Process Improvement Workbook.** Buckner, K.P.; Leete, R.S. Jr.; West, J.A. Oak Ridge Y-12 Plant, TN (United States). 1 Jan 1993. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE93011839. Source: OSTI; NTIS; GPO Dep.

This Workbook was written by a team from the Y-12 Quality Division. We have lots of collective experience in improving things, and we assembled our thoughts and ideas. This Workbook is our own idea. For years, we (probably like you) have been exposed to books, videotapes, and courses on the "how-to" of improving things. We found that if you look at all the energy people have put into showing us a better way, and then you look at all the results we have to show for their suggestions and tactics, there is an imbalance. Why don't we have more results to show that improvements have been made? We decided the reason had to be a problem of methods. We decided we had the ingredients, but not the recipe! This is a hands-on Workbook designed for individual or team use. It guides you to improve whatever process you choose. This Workbook ask questions, and your route through it depends on your answers and on the type of improvement you want. You'll use one Workbook for only one process. Each process will have its own Workbook. To use your Workbook, just read the questions and follow the directions. Your notes document what you believe and what you learn from others. Your Workbook will become a handy record of your process. You can use it to explain the process to others, including your Customers and Suppliers.

25385 (ANL/MCS/CP–79562) **Toward a verifiable approach to the design of concurrent computations.** Chisholm, G.H. Argonne National Lab., IL (United States). [1993]. 13p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-930372–11: 1993 international simulators conference on high performance computing, Arlington, VA (United States), 29 Mar - 1 apr 1993). Order Number DE93012908. Source: OSTI; NTIS; GPO Dep.

Distributed programs are dependent on explicit message passing between disjoint components of the computation. This paper is concerned with investigating an approach for proving correctness of distributed programs under an assumed data-exchange capability. Stated informally, the data exchange assumption is that every message is passed correctly, i.e., neither lost nor corrupted. One approach for constructing a proof under this assumption would be to embed an abstract model of the data communications mechanism into the program specification. The Message Passing Interface (MPI) standard provides a basis for such a modal. In support of our investigations, we have developed a high-level specification using the ASLAN specification language. Our specification is based on a generalized communications model from which the MPI modelmay be derived. We describe the specification of this model and an approach to the specification of distributed programs with explicit message passing based on a verifiable data exchange model.

25386 (BNL–48759) **Self organized criticality.** Creutz, M. Brookhaven National Lab., Upton, NY (United States). Mar 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9302112–1: Madi Gras conference on concurrent computing in the physical sciences, Baton Rouge, LA (United States), 18-20 Feb 1993). Order Number DE93013182. Source: OSTI; NTIS; INIS; GPO Dep.

Self organized criticality refers to the tendency of highly dissipative systems to drive themselves to a critical state. This has been proposed to explain why observed physics often displays a wide disparity of length and time scales. The phenomenon can be studied in simple cellular automaton models.

25387 (CEA-CONF–11246) **New improvements in the self-shielding formalism of the Apollo-2 code.** Coste, M.; Tellier, H.; Ribon, P.; Raepsaet, V.; Van der Gucht, C. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie. 1993. [5p.] (CONF-930404–: International topical meeting on mathematical methods and supercomputing in nuclear applications (M&C+SNA '93), Karlsruhe (Germany), 19-23 Apr 1993). Order Number DE93626601. Source: OSTI; NTIS (US Sales Only); INIS.

One important modelization of a transport code working on a coarse energy mesh is the self-shielding. The French transport code APPOLO 2, developed at the Commissariat a l'Energie Atomique, uses a self-shielding formalism based on a double equivalence. First a homogenization gives the reaction rates in a heterogeneous geometry, and then a multigroup equivalence gives, once the reaction rates are known, the self-shielded cross-sections. The homogenization is a very sensitive part because it is the one which requires physical modelizations. We have added a new model which allows us to treat numerous narrow resonances statistically distributed in the same group of the multigroup mesh. It is important to notice that for a narrow resonance isolated in a group, that new model is equivalent to the previous narrow resonance model (NR).

25388 (CONF-930245–) **Privacy and Security Research Group workshop on network and distributed system security: Proceedings.** Lawrence Livermore National Lab., CA (United States). 1993. 135p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. From Privacy and Security Research Group workshop on network and distributed systems security; San Diego, CA (United States); 11-12 Feb 1993. Order Number DE93010504. Source: OSTI; NTIS; GPO Dep.

This report contains papers on the following topics: NREN Security Issues: Policies and Technologies; Layer Wars: Protect the Internet with Network Layer Security; Electronic Commission Management; Workflow 2000 - Electronic Document Authorization in Practice; Security Issues of a UNIX PEM Implementation; Implementing Privacy Enhanced Mail on VMS; Distributed Public Key Certificate Management; Protecting the Integrity of Privacy-enhanced Electronic Mail; Practical Authorization in Large Heterogeneous Distributed Systems; Security Issues in the Truffles File System; Issues surrounding the use of Cryptographic Algorithms and Smart Card Applications; Smart Card Augmentation of Kerberos; and An Overview of the Advanced Smart Card Access Control System.

25389 (CONF-9305151–) **Fifteenth Department of Energy Computer Security Group training conference: Mission possible: Connected and protected: Proceedings.** USDOE Office of Administration and Management, Washington, DC (United States). [1993]. 244p. Sponsored by USDOE, Washington, DC (United States). From 15. computer security group training conference: mission possible - connected and protected; Albuquerque, NM (United States); 3-6 May 1993. Order Number DE93011853. Source: OSTI; NTIS; GPO Dep.

These proceedings from the March 1993 conference contain eighteen papers on various methods for maintaining computer security. Systems for protecting computer networks are described, as well as microcomputers and personal computers. Safeguards for illegal intrusions from both outsiders and insiders are reported. Also, training efforts to prevent intrusions into computer networks are described. Individual papers are abstracted separately.

25390 (DL-SCI-TM–88-E) **REX - a program for the analysis of X-ray reflectivity data: user guide and programmer manual.** Crabb, T.A. (Commission of the European Communities, Ispra (Italy). Joint Research Centre); Gibson, P.N.; Roberts, K.J. Daresbury Lab. (United Kingdom). Dec 1992. [41p.] Order Number DE93626602. Source: OSTI; NTIS (US Sales Only); INIS.

A FORTRAN program REX, which has been developed to facilitate the interpretation of X-ray reflectivity data, is described. The program allows the simulation of reflectivity profiles as a function of either incident angle or of energy. Factors such as anomalous dispersion, and surface and interface roughness are taken into account in the model. In addition, experimental data of reflectivity as a function of incident angle can be matched to user-supplied theoretical parameters by a least-squares refinement procedure. Experimental reflectivity data recorded at several X-ray wavelengths can be analysed simultaneously, thus eliminating certain experimental errors. (author).

25391 (DOE/ER–0536) **The DOE Program in High-Performance Computing and Communications (HPCC).** USDOE Office of Energy Research, Washington, DC (United States). Office of Scientific Computing. Mar 1993. 99p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93013813. Source: OSTI; NTIS; GPO Dep.

This document is intended to serve two purposes. Its first purpose is to report to Congress, as mandated in the High-Performance Computing Act of 1991, the considerable progress that the Department of Energy has made in 1992 toward achieving the goals of the High-Performance Computing and Communications (HPCC) Program. Its second purpose is to provide a snapshot of and an introduction to the many programs administered by the Office of Scientific Computing under the auspices of the HPCC Program.

25392 (DOE/ER/25047–5) **Optimization and eigenvalue computation with application to meteorology and oceanography: Progress report, August 1, 1992–July 31, 1993.** Nocedal, J. Northwestern Univ., Evanston, IL (United States). May 1993. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER25047. Order Number DE93015310. Source: OSTI; NTIS; GPO Dep.

Our computational experience has shown that dynamic scaling techniques can have a dramatic effect in the efficiency of optimization algorithms, especially when the number of variables is very large. Conjugate gradient and limited memory methods do not have adequate information on the Hessian matrix and dynamic scaling of the variables can supply some of this missing information. In [1] we developed a full-rank scaling technique for variable metric methods that is globally and superlinearly convergent on general problems. We have also proposed a new technique for accelerating the optimization process in the solution of data assimilation problems. This

is an area where optimization plays a crucial role, since the four dimensional assimilation approach consists of using a nonlinear optimization code to adjust the initial conditions of the model so that measurements distributed in space and time can be adequately predicted. Each iteration of the optimization method requires a full simulation of the model a process that typically takes 1 hour on the CRAY 90. We have found that by computing a few extreme eigenvalues of the Hessian matrix, and by incorporating this information in a limited memory code, the number of simulations can be reduced by at least 50%. This is highly significant and represents a substantial contribution to the area of variational assimilation of data. We have also developed an extension of the limited memory BFGS method that is capable of handling simple bounds on the variables, providing more freedom to the modeler [2]. This work was possible by the development of compact matrix representations of limited memory matrices [3], which keep the computation cost of the iteration to a minimum. Indeed we have shown that the operations with limited memory BFGS matrices are optimal in terms of arithmetic operations, since they can be rewritten as the reverse automatic differentiation of an auxiliary function [4].

25393 (DOE/ER/25136–1) **Newton iterative methods for large scale nonlinear systems: Progress report, 1992–1993.** Walker, H.F.; Turner, K. Utah State Univ., Logan, UT (United States). Dept. of Mathematics and Statistics. [1993]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER25136. Order Number DE93015357. Source: OSTI; NTIS; GPO Dep.

Objective is to develop robust, efficient Newton iterative methods for general large scale problems well suited for discretizations of partial differential equations, integral equations, and other continuous problems. A concomitant objective is to develop improved iterative linear algebra methods. We first outline research on Newton iterative methods and then review work on iterative linear algebra methods. (DLC)

25394 (EGG–10617-6097) **An alternative to sneakernet.** Orrell, S.; Ralstin, S. EG and G Energy Measurements, Inc., Albuquerque, NM (United States). Kirtland Operations. [1993]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-88NV10617. (CONF-9305151–1: 15. computer security group training conference: mission possible - connected and protected, Albuquerque, NM (United States), 3-6 May 1993). Order Number DE93012130. Source: OSTI; NTIS; GPO Dep.

Security plans for classified computer systems often specify that only a small percentage of the data processed will be classified. Thus, the bulk of the data on such secure systems is unclassified. This situation requires that some mechanism be provided for moving files to or from the open environment. For many years, this has been accomplished by writing selected files to a magnetic medium, and carrying it to another system where the files are retrieved. These procedures, in many cases, have been developed informally and ad hoc to a specific transfer requirement. This media transport process, referred to as sneakernet, often is manually logged, if at all, and controlled only by administrative procedures. While sneakernets may isolate secure systems from direct attack, other security concerns remain. There has been little guidance available for handling such transfers in a secure manner. Comprehensive criteria for the security evaluation of the procedures used for these transfers have yet to be published. This paper examines the security concerns associated with transfers of unclassified files between security environments and develops a set of criteria which can be used in evaluating the security of any system or procedure for that purpose. Methods for bidirectional unclassified file transfer between secure and open environments could range from completely manual to fully automated. The criteria developed, however, are intended to be generic and to apply to any system for the purpose, existing or proposed.

25395 (EGG-CODP–10620(3-93)) **EXCHANGE: Volume 3-93, March 1993.** Boltz, J.C. (ed.). EG and G Idaho, Inc., Idaho Falls, ID (United States). Mar 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE93012169. Source: OSTI; NTIS; GPO Dep.

This report discusses the following topics on computer environments: Releasing computer software outside EG&G Idaho; Ilford digital photo imager; mandatory upgrade of PC ORPS software; ORPS host computer upgrade; EROB computer users see network change; password expiration notice; big iron still has place in HPC market; handy scripts to copy and move files; more on workstation password expiration; training center course schedule for April 1993; Microsoft Word Version 5.1a- button bar; file attributes can provide you greater flexibility; constructing a personal WordPerfect dictionary; and Windows shortcuts.

25396 (EGG-M–92595) **Intelligent scheduling support for the US Coast Guard.** Darby-Dowman, K. (Brunel Univ., Uxbridge (United Kingdom)); Lucas, C.; Mitra, G.; Fink, R.; Kingsley, L.; Smith, J.W. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1992]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9211227–1: Intelligent scheduling systems symposium, San Francisco, CA (United States), 1 Nov 1992). Order Number DE93010802. Source: OSTI; NTIS; GPO Dep.

This paper will discuss a joint effort by the U.S. Coast Guard Research & Development Center, Idaho National Engineering Laboratory and Brunel University to provide the necessary tools to increase the human scheduler's capability to handle the scheduling process more efficiently and effectively. Automating the scheduling process required a system that could think independently of the scheduler, that is, the systems needed its own control mechanism and knowledge base. Further, automated schedule generation became a design requirement and sophisticated algorithms were formulated to solve a complex combinatorial problem. In short, the resulting design can be viewed as a hybrid knowledge-based mathematical programming application system. This document contains an overview of the integrated system, a discrete optimization model for scheduling, and schedule diagnosis and analysis.

25397 (ESTSC–000337C017500) **PDQ7: 1,2 or 3-d few-gp diffusion depletion.** Pruitt, S.J. (Boeing Computer Services, Richland, WA (United States)). Boeing Computer Services Co., Richland, WA (United States). 1 Jan 1980. Sponsored by USDOE, Washington, DC (United States). (NESC–275). Source: ESTSC.

Description: CYBER175; NOS 1.2 (CDC CYBER175); SCOPE 2.FORTRAN IV and COMPASS; 1 Mag Tape.

The PDQ series of programs is designed to solve the neutron diffusion-depletion problem in one, two or three dimensions. The three-dimensional spatial calculation may be either explicit or discontinuous trial function synthesis. Up to five lethargy groups are permitted. Adjoint, fixed source, one iteration, additive fixed source, eigenvalue, and boundary value calculations may be performed. The programs utilize the HARMONY system for time-dependent representation of cross section variation and generalized depletion chain solutions. Geometries available include rectangular, cylindrical, spherical, and hexagonal. All allow variable mesh in all dimensions. Various control searches as well as temperature and xenon feedback are provided.

25398 (ESTSC–000581IBMPC00) **APS1.1: Costs of Building Waste Facilities; Price Per Shipment to Recoup Costs.** Boyd, K. (EG and G Idaho Inc., Idaho Falls, ID (United States)); Branham-Haar, K.A.; Smith, P. EG and G Idaho, Inc., Idaho Falls, ID (United States). 1 May 1993. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Source: ESTSC.

Description: IBM PC; MS-DOS 5.0; Modula-2; 1 3.5 Diskette. Calls to M2SAGE, a library of reusable Modula-2 code, represent approximately 33 percent of the code. .EXE indicates executable modules, .DFL indicates the data dictionary, .DAT and .IDX indicate the data and index files, .DOC indicates user manual documentation. PKZIP 2.046 used to compress/uncompress files. APS.DOC is the user manual. It was created using Word Perfect 5.1. It is intended for print out to an Hewlett Packard Laser-Jet III or better with fully scalable fonts.

The Automated Pricing Schedule is a computer model for evaluating the economics of developing, operating, and closing a low-level radioactive waste disposal site. It provides pricing for individual shipments based on the characteristics of the shipment, and calculates a disposal fee to be charged for each shipment to recover the costs of the facility. It includes a sensitivity analysis module to evaluate the effect of varying the parameters of the model.

25399 (ESTSC–000583I037000) **TRIPM: Water & Solute Transport Porous Media.** Gureghian, A.B. (Battelle Columbus Labs, OH (United States)). Battelle Memorial Inst., Columbus, OH (United States). Office of Nuclear Waste Isolation. 1 May 1983. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10140. (NESC–1028). Source: ESTSC.

Description: IBM370; OS/MVT (IBM370); MVS (IBM3033); FORTRAN IV; 1 Mag Tape. The user must properly DIMENSION the BAND, BANDP, and BANDG arrays in the MAIN routine for each TRIPM problem. Generally, the user will be able to determine the proper values for a simple mesh configuration; however, for an elaborate mesh the user can obtain the proper values from TRIPM output by an abbreviated run, if necessary. To produce graphic output, TRIPM uses the Integrated Software Systems Corporation's (ISSCO) proprietary graphics software product, DISSPLA which is not included in the package.

TRIPM is a mathematical model designed to predict the transport of radionuclides and their decay products in a saturated-unsaturated vertical plane of a phreatic aquifer under isothermal conditions. The model is composed of two modules: the first calculates the pressure distribution in the domain of interest, enabling one to compute the velocities and soil moisture; the second calculates the migration of the various species by taking into account the major processes associated with the transport phenomena of a dissolved substance in porous media, i.e. advection, mechanical dispersion, molecular diffusion, radioactive decay and sorption. The influence of soil-water pH on the distribution coefficient is also considered. The first module may be used independently of the second.

25400 (ESTSC–000584IBMPC00) **DIAMANT-2: Transport Code for Regular Triangular Geometry.** Kufner, K. (Kernforschungszentrum Karlsruhe GmbH, Karlsruhe (Germany)); Burkhard, J.; Heger, R. OECD Nuclear Energy Agency, 75 - Paris (France). 1 Jun 1987. Sponsored by National Endowment for the Arts, Washington, DC (United States). (NESC–NEA0672). Source: ESTSC.

Description: IBM PC; MS-DOS 4.01; FORTRAN 77; 2 3.5 Diskettes. This code was designed to run under control of the modular code system KAPROS but it can also be used as stand-alone code. It is recommended to replace the sytem-dependent timing functions TASKTI and TIMLIM by local equivalents.

DIAMANT2 solves the two-dimensional static multigroup neutron transport equation in planar regular triangular geometry. Both regular and adjoint, inhomogeneous and homogeneous problems subject to vacuum, reflective or input specified boundary flux conditions are solved. Anisotropy is allowed for the scattering source. Volume and surface sources are allowed for inhomogeneous problems.

25401 (ESTSC/NRC/R–000003IBMPC03) **IRRAS4.15: Integrated Reliability and Risk Analysis.** Russell, K.D. (EG and G Inc., Idaho Falls, ID (United States)). EG and G Idaho, Inc., Idaho Falls, ID (United States). 1 Nov 1992. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research. DOE Contract AC07-76ID01570. Source: ESTSC.

Description: IBM PC; IBM/Microsoft DOS version 3.3 orMODULA-2; 3 5.25 Diskettes. This software uses the Media Cybernetics HALO graphical support routines. The run time files are included with the software and can be distributed with this software as a license has been acquired. Since no source code or sample problems were included in the submittal of this package, the executable, as submitted by author, was evaluated with a limited testing procedure.

IRRAS4.15 is a program developed for the purpose of performing those functions necessary to create and analyze a complete Probabilistic Risk Assessment(PRA). This program includes functions to allow the user to create event trees and fault trees, to define accident sequences and basic event failure data, to solve system and accident sequence fault trees, to quantify cut sets, and to perform uncertainty analysis on the results. Also included in this program are features to allow the analyst to generate reports and displays that can be used to document the results of an analysis. Since this software is a very detailed technical tool, the user of this program should be familiar with PRA concepts and the methods used to perform these analyses.

25402 (IC–93/65) **The RNA world, automatic sequences and oncogenetics.** Tahir Shah, K. International Centre for Theoretical Physics, Trieste (Italy). Apr 1993. [40p.] Order Number DE93624727. Source: OSTI; NTIS (US Sales Only); INIS.

We construct a model of the RNA world in terms of naturally evolving nucleotide sequences assuming only Crick-Watson base pairing and self-cleaving/splicing capability. These sequences have the following properties. (1) They are recognizable by an automation (or automata). That is, to each k-sequence, there exist a k-automation which accepts, recognizes or generates the k-sequence. These are known as automatic sequences. Fibonacci and Morse-Thue sequences are the most natural outcome of prebiotic chemical conditions. (2) Infinite (resp. large) sequences are self-similar (resp. nearly self-similar) under certain rewrite rules and consequently give rise to fractal (resp.fractal-like) structures. Computationally, such sequences can also be generated by their corresponding deterministic parallel re-write system, known as a DOL system. The self-similar sequences are fixed points of their respective rewrite rules. Some of these automatic sequences have the capability that they can read or "accept" other sequences while others can detect errors and trigger error-correcting mechanisms. They can be enlarged and have block and/or palindrome structure. Linear recurring sequences such as Fibonacci sequence are simply Feed-back Shift Registers, a well know model of information processing machines. We show that a mutation of any rewrite rule can cause a combinatorial explosion of error and relates this to oncogenetical behavior. On the other hand, a mutation of sequences that are not rewrite rules, leads to normal evolutionary change. Known experimental results support our hypothesis. (author). Refs.

25403 (INIS-mf–13503, pp. 12-15) **Automatic creation of simulation configuration: The SIPA workshop: SWORD.** Oudot, G. (Thomson-CSF Simulator Department, Cergy-Pontoise (France)); Poizat, F. European Nuclear Society (ENS), Bern (Switzerland); Czech Nuclear Society, Prague (Czech Republic); Slovak Nuclear Society, Bratislava (Slovakia). Jan 1993. (CONF-921068–: East-West topical meeting: the safe and reliable operation of light water reactor NPP's, Prague (Czechoslovakia), 18-21 Oct 1992). In *Topform '92: the safe and reliable operation of LWR NPPs. Vol. II: Poster papers.* [245p.] Order Number DE93625345. Source: OSTI; NTIS (US Sales Only); INIS.

SIPA, which stands for 'Simulator for Post Accident', includes: (1) a sophisticated software oriented workshop SWORD (which stands for 'Software Workshop Oriented towards Research and Development') designed in the ADA language including integrated CAD system and software tools for automatic generation of simulation software and man-machine interface in order to operate run-time simulation; (2) a 'simulator structure' based on hardware equipment and software for supervision and communications; (3) simulation configuration generated by SWORD, operated under the control of the 'simulator structure' and run on a target computer. SWORD has already been used to generate two simulation configurations (French 900 MW and 1300 MW nuclear power plants), which are now fully operational on the SIPA training simulator. (Z.S.) 1 ref.

25404 (JAERI-M–93-033) **Proceedings of the 8th topical meeting on nuclear code development.** Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1993. 253p. (In Japanese, English). (CONF-9211246–: 8. topical meeting on nuclear code development, Tokai (Japan), 11-12 Nov 1992). Order Number DE93797613. Source: OSTI; NTIS; INIS.

The 8th Topical Meeting on Nuclear Code Development, organized by Committee on Reactor Physics and Nuclear Codes Committee of Japan Atomic Energy Research Institute (JAERI), was held at Tokai Research Establishment of JAERI, on 11th and 12th of November, 1992. In the meeting, 14 papers were presented on the topics of (1) the next generation nuclear reactor design system and (2) advances of the nuclear fuel reprocessing safety analysis codes. These papers are compiled in this proceedings. (author).

define computers for HEP computing. Nodarse, F.F.; Ivanov, V.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1991. [16p.] Order Number DE93626603. Source: OSTI; NTIS (US Sales Only); INIS.

Using BLACKBOARD architecture and qualitative model, an expert systm was developed to assist the use in defining the computers method for High Energy Physics computing. The COMEX system requires an IBM AT personal computer or compatible with than 640 Kb RAM and hard disk. 5 refs.; 9 figs.

25406 (JINR-R-5-91-559) **On a convergence of iterative Newton's scheme.** Zhanlav, T.; Puzynin, I.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1991. [8p.] (In Russian). Order Number DE93626604. Source: OSTI; NTIS (US Sales Only); INIS.

The continuous analog of Newton's method is studied. The algorithm for calculating the iterative parameter is given and the convergence of iterative Newton's scheme for solving the nonlinear functional equation in Banach space is established. 8 refs.

25407 (KFKI-1992-25/G) **Logic based feature detection on incore neutron spectra.** Bende-Farkas, S. (Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics); Kiss, S.; Racz, A. Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics. Sep 1992. [18p.] (CONF-9206369–: IMORN-23, Nykoeping (Sweden), 3-5 Jun 1992). Order Number DE93626605. Source: OSTI; NTIS (US Sales Only); INIS.

A methodology is proposed to investigate neutron spectra in such a way which is similar to human thinking. The goal was to save experts from tedious, mechanical tasks of browsing a large amount of signals in order to recognize changes in the underlying mechanisms. The general framework for detecting features of incore neutron spectra with a rulebased methodology is presented. As an example, the meaningful peaks in the APSDs are determined. This method is a part of a wider project to develop a noise diagnostic expert system. (R.P.) 6 refs.; 6 figs.; 1 tab.

25408 (LA-UR-92-3770) **Completing fault models for abductive diagnosis.** Knill, E. (Los Alamos National Lab., NM (United States)); Cox, P.T.; Pietrzykowski, T. Los Alamos National Lab., NM (United States). 5 Nov 1992. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930848–1: 13. international joint conference on artificial intelligence, Chambery, Savoie (France), 29 Aug - 3 sep 1993). Order Number DE93003832. Source: OSTI; NTIS; GPO Dep.

In logic-based diagnosis, the consistency-based method is used to determine the possible sets of faulty devices. If the fault models of the devices are incomplete or nondeterministic, then this method does not necessarily yield abductive explanations of system behavior. Such explanations give additional information about faulty behavior and can be used for prediction. Unfortunately, system descriptions for the consistency-based method are often not suitable for abductive diagnosis. Methods for completing the fault models for abductive diagnosis have been suggested informally by Poole and by Cox et al. Here we formalize these methods by introducing a standard form for system descriptions. The properties of these methods are determined in relation to consistency-based diagnosis and compared to other ideas for integrating consistency-based and abductive diagnosis.

25409 (LA-UR-93-1659) **The FBI wavelet/scalar quantization standard for gray-scale fingerprint image compression.** Bradley, J.N. (Los Alamos National Lab., NM (United States)); Brislawn, C.M.; Hopper, T. Los Alamos National Lab., NM (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-930445–13: Society of Photo-Optical Instrumentation Engineers (SPIE) OE/aerospace science and sensing meeting, Orlando, FL (United States), 11-16 Apr 1993). Order Number DE93012706. Source: OSTI; NTIS; GPO Dep.

The FBI has recently adopted a standard for the compression of digitized 8-bit gray-scale fingerprint images. The standard is based on scalar quantization of a 64-subband discrete wavelet transform decomposition of the images, followed by Huffman coding. Novel features of the algorithm include the use of symmetric boundary conditions for transforming finite-length signals and a subband decomposition tailored for fingerprint images scanned at 500 dpi. The standard is intended for use in conjunction with ANSI/NBS-CLS 1-1993, American National Standard Data Format for the Interchange of Fingerprint Information, and the FBI's Integrated Automated Fingerprint Identification System.

25410 (LLNL-M-276-Rev.2) **PANACEA user's manual for PANACEA Version 2.0: Revision 2.** Brown, S.A.; Braddy, D. Lawrence Livermore National Lab., CA (United States). 4 Jan 1993. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93012502. Source: OSTI; NTIS; GPO Dep.

A numerical simulation code is fundamentally a device to solve an initial value problem. Very often these programs are written starting with the routines that solve some system of equations. Unless care is taken to formulate these routines with regard to a host of issues (e.g., data flow), it can be very awkward to set up a problem or to look at the answers that the code returns. Furthermore, it can be nearly impossible to take advantage of some of the excellent work that various groups have done (e.g., equation solver packages) because the data flow and structuring issues have not been given sufficient attention in the program design stages. One way to avoid some of these difficulties is to write the data flow controls, the I/O mechanisms, and the database manager first. With these parts in place, there is a great deal of guidance for building the parts of a simulation code that deal with the specific set of equations to be solved; thus initial value data is fed in and the solution is written out clearly and conveniently. Furthermore, this approach provides a basis for defining some conventions to allow the sharing of simulation modules. It also helps isolate the machine dependencies of a code in a very few places, which greatly enhances the portability of the code. PANACEA is a library of routines built to address these issues. In essence, PANACEA attempts to embody all of the functionality of a numerical simulation code, which is generic to all simulation codes. It accomplishes this by implementing a model of the simulation as a system of services (routines), which are bound together with the simulation specific routines provided by the code developer. One useful result of this approach is that it effectively imposes a discipline for the development of simulation codes that promote shareability, portability, and inter-operability.

25411 (NAL-TR-1154) **Simulation of a parallel computer.** Harada, K. (National Aerospace Laboratory, Tokyo (Japan)); Yoshida, M.; Nakamura, K. National Aerospace Lab., Chofu, Tokyo (Japan). May 1992. 36p. (In Japanese). Order Number DE93793618. Source: OSTI; NTIS; Available from National Aerospace Laboratory, 44-1, Shindaiji Higashicho 7-chome, Chofu-City, Tokyo, Japan.

A simulation program and an assembler were prepared for a parallel computer with 128× 256 operators operating under a numerical simulator at National Aerospace Laboratory. Examples of evaluation on the parallel computer, estimation of its maximum performance, and the case comparing the parallel computer with one processing element one described. The developed assembler operates on FACOM-M780, and converts the starting program into a machine language for the parallel computer. The verifying simulation used a program to derive a maximum value in data in the array data memory elements and a program to analyze flow fields around a two-dimensional cylinder. The former simulation presented that consistency in the command system for mask operation is more important than network improvement. This should be given due considerations when handling a three-dimensional problem with a large number of data in the memory elements. In the latter simulation, such results were obtained that vorticity computation can be expected of performance corresponding to the number of operators, that computing the flow functions achieved the expectation at 60% (performance improvement is possible), and computing surface pressure, resistance and lift resulted in low efficiency (because of data transfer processing time). 17 refs., 28 figs., 8 tabs.

25412 (NUREG/CR-6035) **Feasibility study for improved steady-state initialization algorithms for the RELAP5 computer code: Phase 1 improved steady-state initialization algorithms for computer codes.** Paulsen, M.P. (Computer Simulation and Analysis, Inc., Idaho Falls, ID (United States)); Peterson, C.E.;

Katsma, K.R. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research; Computer Simulation and Analysis, Inc., Idaho Falls, ID (United States). Apr 1993. 64p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; INIS; GPO; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020.

A design for a new steady-state initialization method is presented that represents an improvement over the current method used in RELAP5. Current initialization methods for RELAP5 solve the transient fluidflow balance equations simulating a transient to achieve steady-state conditions. Because the transient solution is used, the initial conditions may change from the desired values requiring the use of controllers and long transient running times to obtain steady-state conditions for system problems. The new initialization method allows the user to fix thermal-hydraulic values in volumes and junctions where the conditions are best known and have the code compute the initial conditions in other areas of the system. The steady-state balance equations and solution methods are presented. The constitutive, component, and specialpurpose models are reviewed with respect to modifications required for the new steady-state initialization method. The requirements for user input are defined and the feasibility of the method is demonstrated with a testbed code by initializing some simple channel problems. The initialization of the sample problems using, the old and the new methods are compared.

25413 (ORNL/FTR–4371) **[Parallel processing conferences in France]: Foreign trip report, August 31–September 9, 1992.** Walker, D.W. Oak Ridge National Lab., TN (United States). 14 Sep 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012243. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler first attended the CONPAR 92/VAPP V Joint Conference on Vector and Parallel Processing. The conference featured many presentations and other activities of interest to ORNL research programs using advanced architecture computing systems, particularly in the area of distributed memory concurrent computing. Following this the traveler attended the CNRS-NSF Workshop on Environments and Tools for Parallel Scientific Processing, where he presented an invited talk describing recent joint research at ORNL and the University of Tennessee, Knoxville, on developing a software library for performing linear algebra computations on distributed memory concurrent computers. The traveler held numerous technical discussions on issues having direct relevance to ORNL research programs.

25414 (ORNL/FTR–4402) **Participation in the COMPSTAT 1992 symposium on computation statistics: Foreign trip report, August 22–September 12, 1992.** Ostrouchov, G. Oak Ridge National Lab., TN (United States). 28 Sep 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012114. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The traveler first participated in the COMPSTAT 1992 Symposium on Computational Statistics. The symposium contained many presentations and other activities of interest to ORNL research programs that perform data analysis and scientific computing, in particular work requiring advanced statistical computing methods. Here, the traveler, presented a talk describing his recent research in global model search as an exploratory data analytic tool made possible by recent advances in computing systems. Following this, the traveler participated in the Interdisciplinary Short Course on Large Scale Scientific Computing. This was the first such course that emphasized the interdisciplinary aspect of large-scale scientific computing. The traveler held numerous technical discussions on issues having direct relevance to ORNL research programs.

25415 (ORNL/TM–12231) **A proposal for a user-level, message passing interface in a distributed memory environment.** Dongarra, J.J. (Tennessee Univ., Knoxville, TN (United States). Dept. of Computer Science); Hempel, R.; Hey, A.J.G.; Walker, D.W. Oak Ridge National Lab., TN (United States). Feb 1993. 71p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Contract DAAL03-91-C-0047. Order Number DE93013456. Source: OSTI; NTIS; GPO Dep.

This paper describes Message Passing Interface 1 (MPI1), a proposed library interface standard for supporting point-to-point message passing. The intended standard will be provided with Fortran 77 and C interfaces, and will form the basis of a standard high level communication environment featuring collective communication and data distribution transformations. The standard proposed here provides blocking, nonblocking, and synchronized message passing between pairs of processes, with message selectivity by source process and message type. Provision is made for noncontiguous messages. Context control provides a convenient means of avoiding message selectivity conflicts between different phases of an application. The ability to form and manipulate process groups permits task parallelism to be exploited, and is a useful abstraction in controlling certain types of collective communication.

25416 (ORNL/TM–12287) **The KSR1: Experimentation and modeling of poststore.** Rosti, E. (Milan Univ. (Italy). Dipt. di Scienze dell'Informazione); Smirni, E.; Wagner, T.D.; Apon, A.W.; Dowdy, L.W. Oak Ridge National Lab., TN (United States). Feb 1993. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93012539. Source: OSTI; NTIS; GPO Dep.

Kendall Square Research introduced the KSR1 system in 1991. The architecture is based on a ring of rings of 64-bit microprocessors. It is a distributed, shared memory system and is scalable. The memory structure is unique and is the key to understanding the system. Different levels of caching eliminates physical memory addressing and leads to the ALLCACHE™ scheme. Since requested data may be found in any of several caches, the initial access time is variable. Once pulled into the local (sub)cache, subsequent access times are fixed and minimal. Thus, the KSR1 is a Cache-Only Memory Architecture (COMA) system.This paper describes experimentation and an analytic model of the KSR1. The focus is on the poststore programmer option. With the poststore option, the programmer can elect to broadcast the updated value of a variable to all processors that might have a copy. This may save time for threads on other processors, but delays the broadcasting thread and places additional traffic on the ring. The specific issue addressed is to determine under what conditions poststore is beneficial. The analytic model and the experimental observations are in good agreement. They indicate that the decision to use poststore depends both on the application and the current system load.

25417 (ORNL/TM–12375) **Proceedings of the Seventh International Symposium on Methodologies for Intelligent Systems (Poster Session).** Harber, K.S. (ed.). Oak Ridge National Lab., TN (United States). May 1993. 174p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. (CONF-9306151–: 7. international symposium on methodologies for intelligent systems, Trondheim (Norway), 15-18 Jun 1993). Order Number DE93013470. Source: OSTI; NTIS; GPO Dep.

This report contains the following papers: Implications in vivid logic; a self-learning Bayesian Expert System; a natural language generation system for a heterogeneous distributed database system; "competence-switching" managed by intelligent systems; strategy acquisition by an artificial neural network: Experiments in learning to play a stochastic game; viewpoints and selective inheritance in object-oriented modeling; multivariate discretization of continuous attributes for machine learning; utilization of the case-based reasoning method to resolve dynamic problems; formalization of an ontology of ceramic science in CLASSIC; linguistic tools for intelligent systems; an application of rough sets in knowledge synthesis; and a relational model for imprecise queries. These papers have been indexed separately.

25418 (PNL-SA–21790) **Parallel inverse iteration with reorthogonalization.** Fann, G.I.; Littlefield, R.J. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-930331–10: 6. Society for Industrial and Applied Mathematics (SIAM) conference on parallel processing for scientific computing, Norfolk, VA (United States), 21-24 Mar 1993). Order Number DE93012867. Source: OSTI; NTIS; GPO Dep.

A parallel method for finding orthogonal eigenvectors of real symmetric tridiagonal is described. The method uses inverse iteration with repeated Modified Gram-Schmidt (MGS) reorthogonalization of the unconverged iterates for clustered eigenvalues. This approach is more parallelizable than reorthogonalizing against fully converged eigenvectors, as is done by LAPACK's current DSTEIN routine. The new method is found to provide accuracy and speed comparable to DSTEIN's and to have good parallel scalability even for matrices with large clusters of eigenvalues. We present al results for residual and orthogonality tests, plus timings on IBM RS/6000 (sequential) and Intel Touchstone DELTA (parallel) computers.

25419 (RAL–92-076) **HUMPF [Heterogeneous Unix Montecarlo Production Facility] users guide.** Cahill, P.; Edgecock, R.; Fisher, S.M.; Gee, C.N.P.; Gordon, J.C.; Kidd, T.; Leake, J.; Rigby, D.J.; Roberts, J.H.C. Rutherford Appleton Lab., Chilton (United Kingdom). Nov 1992. [24p.] Order Number DE93626606. Source: OSTI; NTIS (US Sales Only); INIS.

The Heterogenous Unix Monte Carlo Production Facility (HUMPF) simplifies the running of particle physics simulation programs on Unix workstations. Monte Carlo is the largest consumer of IBM (CPU) capacity within the Atlas centre at Rutherford Appleton Laboratory (RAL). It is likely that the future computing requirements of the LEP and HERA experiments cannot be satisfied by the IBM 3090 system. HUMPF adds extra capacity, and can be expanded with minimal effort. Monte Carlo programs are CPU-bound, and make little use of the vector or the input/output capacity of the IBM 3090. Such programs are therefore excellent candidates to use the spare capacity of powerful workstations. The main data storage is still handled centrally by the IBM 3090 and its peripherals. The HUMPF facility is suitable for any program with a similar profile. (author).

25420 (SAND–91-2016C) **Massively parallel multifrontal methods for finite element analysis on MIMD computer systems.** Benner, R.E. Sandia National Labs., Albuquerque, NM (United States). [1993]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9306145–1: 8. international conference on vehicle structural mechanics and computer-aided engineering, Traverse City, MI (United States), 3-5 Jun 1993). Order Number DE93009838. Source: OSTI; NTIS; GPO Dep.

The development of highly parallel direct solvers for large, sparse linear systems of equations (e.g. for finite element or finite difference models) is lagging behind progress in parallel direct solvers for dense matrices and iterative methods for sparse matrices. We describe a massively parallel (MP) multifrontal solver for the direct solution of large sparse linear systems, such as those routinely encountered in finite element structural analysis, in an effort to address concerns about the viability of scalable, MP direct methods for sparse systems and enhance the software base for MP applications. Performance results are presented and future directions are outlined for research and development efforts in parallel multifrontal and related solvers. In particular, parallel efficiencies of 2511/o on 1024 NCUBE 2 nodes and 36% on 64 Intel iPSCS60 nodes have been demonstrated, and parallel efficiencies of 60–85% are expected when a severe load imbalance is overcome by static mapping and dynamic load balance techniques previously developed for other parallel solvers and application codes.

25421 (SAND–92-1724C) **The d-edge shortest-path problem for a Monge graph.** Bein, W.W. (New Mexico Univ., Albuquerque, NM (United States). Dept. of Computer Science); Larmore, L.L.; Park, J.K. Sandia National Labs., Albuquerque, NM (United States). 14 Jul 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930194–1: 4. annual ACM-SIAM conference on discrete algorithms, Austin, TX (United States), 25-27 Jan 1993). Order Number DE93009828. Source: OSTI; NTIS; GPO Dep.

A complete edge-weighted directed graph on vertices 1,2,...,n that assigns cost c(i,j) to the edge (i,j) is called Monge if its edge costs form a Monge array, i.e., for all $i < k$ and $j < l$, $c[i, j]+c[k,l] \leq c[i,l]+c[k,j]$. One reason Monge graphs are interesting is that shortest paths can be computed quite quickly in such graphs. In particular, Wilber showed that the shortest path from vertex 1 to vertex n of a Monge graph can be computed in O(n) time, and Aggarwal, Klawe, Moran, Shor, and Wilber showed that the shortest d-edge 1-to-n path (i.e., the shortest path among all 1-to-n paths with exactly d edges) can be computed in O(dn) time. This paper's contribution is a new algorithm for the latter problem. Assuming $0 \leq c[i,j] \leq U$ and $c[i,j + 1] + c[i + 1,j] - c[i,j] - c[i + 1, j + 1] \geq L > 0$ for all i and j, our algorithm runs in $O(n(1 + 1g(U/L)))$ time. Thus, when $d \gg 1 + 1g(U/L)$, our algorithm represents a significant improvement over Aggarwal et al.'s O(dn)-time algorithm. We also present several applications of our algorithm; they include length-limited Huffman coding, finding the maximum-perimeter d-gon inscribed in a given convex n-gon, and a digital-signal-compression problem.

25422 (SAND–92-2585C) **Finding minimum-quotient cuts in planar graphs.** Park, J.K.; Phillips, C.A. Sandia National Labs., Albuquerque, NM (United States). 18 Nov 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9305153–3: Association for Computing Machinery (ACM) symposium on the theory of computing, San Diego, CA (United States), May 1993). Order Number DE93011675. Source: OSTI; NTIS; GPO Dep.

Given a graph $G = (V, E)$ where each vertex $v \in V$ is assigned a weight w(v) and each edge $e \in E$ is assigned a cost c(e), the quotient of a cut partitioning the vertices of V into sets S and $\bar{S}$ is $c(S, \bar{S})/\min\{w(S), w(S)\}$, where $c(S, \bar{S})$ is the sum of the costs of the edges crossing the cut and w(S) and $w(\bar{S})$ are the sum of the weights of the vertices in S and $\bar{S}$, respectively. The problem of finding a cut whose quotient is minimum for a graph has in recent years attracted considerable attention, due in large part to the work of Rao and Leighton and Rao. They have shown that an algorithm (exact or approximation) for the minimum-quotient-cut problem can be used to obtain an approximation algorithm for the more famous minimumb-balanced-cut problem, which requires finding a cut $(S,\bar{S})$ minimizing $c(S,\bar{S})$ subject to the constraint $bW \leq w(S) \leq (1 - b)W$, where W is the total vertex weight and b is some fixed balance in the range $0 < b \leq \frac{1}{2}$. Unfortunately, the minimum-quotient-cut problem is strongly NP-hard for general graphs, and the best polynomial-time approximation algorithm known for the general problem guarantees only a cut whose quotient is at mostO(lg n) times optimal, where n is the size of the graph. However, for planar graphs, the minimum-quotient-cut problem appears more tractable, as Rao has developed several efficient approximation algorithms for the planar version of the problem capable of finding a cut whose quotient is at most some constant times optimal. In this paper, we improve Rao's algorithms, both in terms of accuracy and speed. As our first result, we present two pseudopolynomial-time exact algorithms for the planar minimum-quotient-cut problem. As Rao's most accurate approximation algorithm for the problem – also a pseudopolynomial-time algorithm – guarantees only a 1.5-times-optimal cut, our algorithms represent a significant advance.

25423 (SAND–93-0044C) **VFGEN: A parallel volume fraction generator for hydrocodes.** Ames, A.L.; Robinson, A.C.; Edwards, T.L. Sandia National Labs., Albuquerque, NM (United States). [1993]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9304114–3: Object-oriented numerics conference, Sunriver, OR (United States), 25-27 Apr 1993). Order Number DE93011673. Source: OSTI; NTIS; GPO Dep.

Mesh generation for hypervelocity impact calculations involves computing the portion of the volume of each cell in a grid filled by a solid object. We have developed a volume fraction generator that supports three-dimensional regular Cartesian grids. It executes on both serial and massively parallel computers, and uses a commercial solid modeler (ACIS) to accurately compute the volume fractions. The volume fraction generator, VFGEN, was developed using an object-oriented paradigm facilitated by the ACIS C++ solid modeler toolkit. Although the underlying problem is embarrassingly parallel, a number of geometric optimizations have been developed to improve speed on serial architectures. The relationship of these optimizations to performance of the algorithm on parallel machines is described.

25424 (SAND–93-0050C) **MatResLib: A reusable, object-oriented material response library.** Wong, M.K.W.; Fang, H.E. Sandia National Labs., Albuquerque, NM (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9304114–2: Object-oriented numerics conference, Sunriver, OR (United States), 25-27 Apr 1993). Order Number DE93011553. Source: OSTI; NTIS; GPO Dep.

Large-scale simulations of solid dynamics problems often require sophisticated models for reproducing material response. The developer of computational mechanics codes is faced with the task of programming the necessary material response algorithms, and also of ensuring that the available system capabilities are properly utilized to obtain the highest possible performance. Often a number of different programs need the same material models. Also, these programs are expected to perform efficiently on a wide variety of platforms. Thus, developing and maintaining a library of material models becomes difficult and time-consuming. In this paper, we describe a set of reusable libraries, written in C++[1], that seeks to minimize these difficulties. These libraries are collectively named MatResLib (for Material Response Library). We have pursued code reusability from four aspects. First, the implementation of new material models is facilitated by reusing code which defines an abstract base class for the type of model being implemented. This approach uses the inheritance mechanism of C++. Second, the library has been designed for reuse of the source code on different computing platforms, including the IBM PC, UNIX workstations, the CRAY-YWP, and the nCUBE 2, Intel/860, and Intel Paragon massively parallel computers. Third, the source code files are reusable among different continuum codes. Fourth, individual model classes are being reused in combination to develop more complex models.

Supercomputing '92, a high-performance computing and communications conference was held, November 16–20, 1992 in Minneapolis, Minnesota. This paper documents the applications and technologies that were showcased in Sandia's research booth at that conference. In particular the demonstrations in high-performance networking, audio-visual applications in engineering, virtual reality, and supercomputing applications are all described.

Order Number DE93009841. Source: OSTI; NTIS; GPO Dep.

The problem of constructing trees given a matrix of interleaf distances is motivated by applications in computational evolutionary biology and linguistics. The general problem is to find an edge-weighted tree which most closely approximates the distance matrix. Although the construction problem is easy when the tree exactly fits the distance matrix, optimization problems under all popular criteria are either known or conjectured to be NP-complete. In this paper we consider the related problem where we are given a partial order on the pairwise distances, and wish to construct (if possible) an edge-weighted tree realizing the partial order. In particular we are interested in partial orders which arise from experiments on triples of species, which determine either a linear ordering of the three pairwise distances (called Total Order Model or TOM experiments) or only the pair(s) of minimum distance apart (called Partial Order Model or POM experiments). The POM and TOM experimental model is inspired by the model proposed by Kannan, Lawler, and Warnow for constructing trees from experiments which determine the rooted topology for any triple of species. We examine issues of construction of trees and consistency of TOM and POM experiments, where the trees may either be weighted or unweighted. Using these experiments to construct unweighted trees without nodes of degree two is motivated by a similar problem studied by Winkler, called the Discrete Metric Realization problem, which he showed to be strongly NP-hard. We have the following results: Determining consistency of a set of TOM or POM experiments is NP-Complete whether the tree is weighted or constrained to be unweighted and without degree two nodes. We can construct unweighted trees without degree two nodes from TOM experiments in optimal $O(n^3)$ time and from POM experiments in $O(n^4)$ time.

25427 (SAND–93-0690C) **Finding a covering triangulation whose maximum angle is provably small.** Mitchell, S.A.; Park, J.K. Sandia National Labs., Albuquerque, NM (United States). 3 Mar 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-930884–2: Workshop on algorithms and data structures, Montreal (Canada), 11-13 Aug 1993). Order Number DE93010691. Source: OSTI; NTIS; GPO Dep.

Given a planar straight-line graph, we find a covering triangulation whose maximum angle is as small as possible. A covering triangulation is a triangulation whose vertex set contains the input vertex set and whose edge set contains the input edge set. Such a triangulation differs from the usual Steiner triangulation in that we may not add a Steiner vertex on any input edge. Covering triangulations provide a convenient method for triangulating multiple regions sharing a common boundary, as each region can be triangulated independently. As it is possible that no finite covering triangulation is optimal in terms of its maximum angle, we propose an approximation algorithm. Our algorithm produces a covering triangulation whose maximum angle γ is probably close to γ_{opt}, a lower bound on the maximum angle in any covering triangulation of the input graph. Note that we must have $\gamma \leq 3\gamma_{opt}$, since we always have $\gamma_{opt} \geq \pi/3$ and no triangulation can contain an angle of size greater than π. We prove something significantly stronger. We show that $\pi - \gamma \geq (\pi - \gamma_{opt})/6$, i.e., our γ is not much closer to π than is γ_{opt}. This result represents the first nontrivial bound on a covering triangulation's maximum angle. We require a subroutine for the following problem: Given a polygon with holes, find a Steiner triangulation whose maximum angle is bounded away from π. No angle larger than $8\pi/9$ is sufficient for the bound on γ claimed above. The number of Steiner vertices added by our algorithm and its running time are highly dependent on the corresponding bounds for the subroutine. Given an n-vertex planar straight-line graph, we require $O(n + S(n))$ Steiner vertices and $O(n \log n + T(n))$ time, where $S(n)$ is the number of Steiner vertices added by the subroutine and $T(n)$ is its running time for an $O(n)$-vertex polygon with holes.

25428 (SAND–93-0742C) **UNICOS® security testing.** Vandevender, W.H. Sandia National Labs., Albuquerque, NM (United States). [1993]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9305151–2: 15. computer security group training conference: mission possible - connected and protected, Albuquerque, NM (United States), 3-6 May 1993). Order Number DE93011680. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Developing security plans and supporting security tests is a very important part of the Department of Energy accreditation process. This paper will discuss the general testing methodology that was used to achieve DOE accreditation of the Secure UNICOS environment at Sandia National Laboratories (NM). In addition, some specific security testing procedures, tests and problem areas will be described.
